Trigger studies for the Higgs pair production in the WWbb final state at sqrt(s)= 13 TeV with the ATLAS detector

Friday, 21 April 2017 17:00 (1 hour)

We report here the results of the search for the Higgs boson pair production where one Higgs boson decay via h->bb and the other via h->WW*->lvqq. where l is either an electron or a muon. This search uses the full dataset 2015 (3.2 fb-1) plus 2016(33.3 fb-1) of proton-proton collision data at the center of mass energy of 13 TeV recorded with the ATLAS detector at the Large Hadron Collider (LHC). In addition studies on trigger are going on by adding a new trigger having 1 lepton and 3 jets together with the 1 lepton trigger to increase the signal acceptance at low lepton pT. The performances of such algorithms will be discussed.
