2 NINJA-1: Successes and limitations

▲□▶▲圖▶▲≣▶▲≣▶ ≣ のQ@

How can numerical relativity be used to improve GW searches?

- Since NR predicts the merger waveform, it can be used to construct complete templates
- Such templates necessarily involve combining the NR results with PN inspiral calculations
- This is not trivial because NR and PN are built on completely different formalisms and approximation schemes

(ロ) (同) (三) (三) (三) (三) (○) (○)

See posters by F. Ohme and R. Sturani

- Still, it turns out that sensible matching procedures can be carried out
- EOB is a successful approach and can be calibrated by using NR results
- A more "phenomenological" approach for combining NR and PN also works well
- The large parameter space with precessing spins and arbitrary mass-ratios (and eccentricities) still remains to be conquered
- Current models work for aligned spins and for at least moderate mass ratios
- Further progress to be expected in the near future (eg in the NR-AR collaboration)

(ロ) (同) (三) (三) (三) (三) (○) (○)

- NR is also very useful in directly testing DA pipelines through signal injections
- There are a variety of DA pipelines, and we would like to understand their comparative advantages and limitations for detecting mergers
- Get the NR and DA groups to interact more closely and to understand needs and limitations

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

This is where the NINJA project comes in

### LSC-Virgo (LVC) analyses of interest

- The low mass search with non-spinning 3.5pN SPA templates (total mass 1-35  $M_{\odot}$ )
- The high mass search currently using non-spinning EOBNR templates (total mass 25-100  $M_{\odot}$ )
- Unmodeled burst searches
- The ringdown search (total mass range is approximately 50-400  $M_{\odot}$ )

Other searches not ruled out

Meetings focused on the NR-DA interface have been very useful

- NRDA 2006 at MIT
- KITP Mini-program at Santa Barbara (Jan 2008)
- NRDA 2008 at Syracuse (3.5 Days, 60 Participants)
- NRDA 2009 at Potsdam (3.5 Days, 85 Participants, scope broadened to also include matter simulations)
- GWBURST 2009 at Chichen Itza (35 participants, more focus on GW bursts and astrophysics)
- NRDA 2010 will take place in June at the Perimeter Institute in Canada

(ロ) (同) (三) (三) (三) (○) (○)

- These meetings have been instrumental in starting several collaborations
  - NINJA was the broadest of these collaborations
  - NINJA-1 started in spring 2008 and completed in early 2009

- Developed a format for exchanging waveforms between groups arXiv:0709.0093
- 10 numerical relativity groups contributed binary black hole merger waveforms of their choice
- Waveforms were added tosimulated colored Gaussian noise
- 9 data analysis groups analyzed the data using a variety of algorithms
- Data analysis groups free to decide what analysis to perform and how to present the results

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

 Waveform repository only to be used for this project, unless separate agreements are made

### NINJA-1 Noise

The simulated noise included 3 LIGO and Virgo detectors

▲□ > ▲圖 > ▲ 画 > ▲ 画 > → 画 → のへで

### NINJA-1 Waveforms

### All NR groups with BBH waveforms participated

Variety of mass-ratios, spin configurations, and also eccentricities

## NINJA-1 Data

- 126 injections into 30 hours of data
- The starting frequency of the dominant (2,2) mode must be below 30 Hz to avoid abrupt turn-on of the signal in band

< ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

- The optimal matched filter SNR must be greater than 5 in at least one detector
- Ionger waveforms biased to low masses to cover mass range

### Mass Estimation for burst and EOB searches

・ロット (雪) (日) (日)

ъ

Bayesian evidence: Taylor F2 vs. Phenomenological templates

 Bottomline:

- All algorithms found the loud injections
- Parameter estimation is an open issue and all pipelines need to work on this

◆□▶ ◆□▶ ◆ □▶ ◆ □▶ ─ □ ─ の < @

Main NINJA papers:

- Status report: arXiv:0905.4227, CQG 26, 114008 (2009)
- The NINJA paper: arXiv:0901.4399, CQG 26, 165008 (2009)

Five papers detailing DA searches:

- Santamaria et. al., CQG 26, 114010 (2009) CBC search with phenomenological templates
- Farr et. al., CQG 26, 114009 (2009) CBC search with PN inspiral and EOBNR templates
- Aylott et. al., CQG 26, 114011 (2009) Bayesian nested-algorithm search
- Stroeer et. al., CQG 26, 114012 (2009) Burst search with HHT method
- Cadonati et. al., CQG 26, 204005 (2009) Burst search with Q-pipeline

#### NINJA-1 was a great success!

- Good contributions from everyone involved
- 10 NR groups (all groups with BBH waveforms) and 9 DA groups

#### Some factors which contributed

- Clearly defined and realistic goals
- Time scale was aggressive, but feasible
- Easy for people to get involved and no hierarchy

Some things that need to be improved

- Gaussian noise prevented realistic false alarm calculation
- No requirements on waveform accuracy
- Short waveforms for NINJA-1 only useful for very high mass
- Tighter coordination between search groups

In a nutshell:

 Systematic tests and comparisons of current LIGO-Virgo (LVC) searches using non-precessing hybrid (NR+PN) waveforms injected in real LVC data

Real data is important:

- Everyone knows how to deal with Gaussian noise
- Most DA pipelines have ways to handle non-gaussianity, signal consistency tests, different detection statistics etc
- We cannot meaningfully compare these choices in simulated noise
- False alarm rates and thresholds can be very different in simulated and real data

(ロ) (同) (三) (三) (三) (○) (○)

We want to inject at low masses, so need hybrid NR waveforms stitched with PN

- NR waveforms must be sufficiently long and accurate to do this
- NR groups can choose their own reasonable matching procedures and comparisons between different groups are encouraged
- Details need to be firmed up in follow-up discussions this will hopefully be one of the scientific results from NINJA-2

We propose to consider only systems with various mass ratios and only aligned (or anti-aligned) spins

This keeps the scope of NINJA-2 reasonable and is feasible to complete in the desired timeframe

(ロ) (同) (三) (三) (三) (○) (○)

The key questions:

- What are the relative detection efficiencies of the different searches over the mass space?
- How well do non-spinning templates work with non-precessing spinning waveforms?
- How do the searches perform in a LISA-style blind Mock Data Challenge?
- How well do parameter estimation techniques work with candidates from these searches

▲□▶▲□▶▲□▶▲□▶ □ のQ@

- We propose to do a LISA-style blind mock-data challenge
- Additional training data sets will be provided as well (Gaussian noise and real data)
- The goal is understanding the efficiency of the detection pipelines and the accuracy of parameter estimation
- The blind challenge data sets can be used to test parameter estimation codes, seeded by information from the search pipelines
- Will strongly encourage close coordination and cross-checks between different analyses
- As a collaboration with the LSC and Virgo, NINJA-2 data analysis will be tightly coupled to the work of the LSC and Virgo search groups

< □ > < 同 > < 三 > < 三 > < 三 > < ○ < ○ </p>

- NINJA-2 kickoff telecon was held on Oct 15, 2009
- Well attended and work is underway
- Will need agreement with LVC to be able to use real data
- Publication will thus have NINJA + full LVC author list
- Mike Boyle and Ajith Parameswaran elected as points of contact for LVC (will rotate every 6 months)

◆□▶ ◆□▶ ▲□▶ ▲□▶ □ のQ@

- Currently preparing science case and getting agreement within NINJA
- Hope to get started by spring 2010

Start dialog between DA & modelers:

- Education of modelers in DA problems & techniques.
- Education of DA in source/emission physics.
- Can we tell supernova mechanisms apart?
- How close does the supernova have to be for this to be possible?
- What other physics/parameters can be constrained (rotation/EOS)?
- Does it make sense to even try to produce systematic templates? How close does the template have to be to the real signal

(ロ) (同) (三) (三) (三) (○) (○)

Plan is to start NINJA-1 style analysis with simulated data

- We want to build on success of NINJA-1
- Benefits for both NR and DA communities
- Aim is to have closer interaction with LVC and to be ready for advanced detectors and GW detection
- Matter NINJA project at earlier stage of development, but expect them to get started soon as well
