

# Geometry of forward TOF

J. Va'vra, SLAC

Light travels 300 $\mu\text{m}$  in one ps

# Content of this talk

- **Follow upon what I have said in my Orsay talk**
  - DIRC-like TOF
  - TOF with cube radiators (run very low gain)

# Changed my mind after inspecting the BaBar forward region a week ago

Space for a  
TOF detector,  
or any other  
one, is **VERY**  
tight !!!

# “DIRC-like” Forward TOF detector ?

## Sector:

12 mm thick quartz bar  
Ave. photon path: ~15 cm  
2 MCP tubes / sector  
1 ASIC chips / sector  
16 pixels / sector  
1 fiber/ sector  
1 HV cable / sector

## Total:

12 sectors - total  
48 MCP-PMTs - total !!!  
Req.pos. accuracy: ~0.5 mm  
Hang it off EMC support ?  
 $r_{\min} \sim 50$  cm ( $\theta \sim 15$ -16°)  
 $r_{\max} \sim 80$  cm ( $\theta \sim 25^\circ$ )  
 $\Delta r \sim 30$  cm

Hamamatsu MCP-PMT with strips and a protection foil:

$\phi$  10  $\mu$ m holes  
6/18/09

A photon is accepted if:  
 $\Sigma(TOP_i^{\text{measured}} - TOP_i^{\text{expected}}) < \text{Cut}$

This design requires  
a high gain operation  
to detect single photons !!!

# Forward geometry with a DIRC-like TOF counter

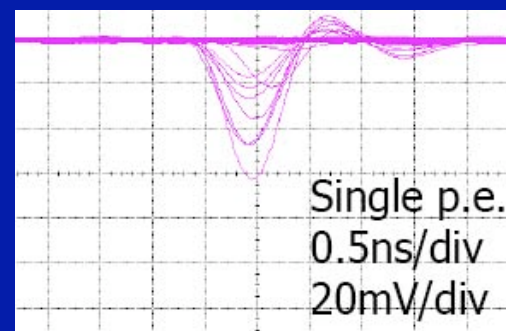

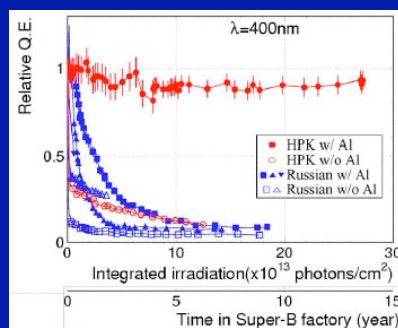

- What is the expected rate fin this location ?

# “DIRC-like” Forward TOF detector is using the same photon detector as the TOP counter

(plots taken from K. Inami's talk about TOP counter at RICH 2007, Trieste & NIM A595(2008)96-99)

- Excellent TTS resolution
- Maximum rate:  $\sim 1 \text{ MHz/cm}^2$  with a  $10 \mu\text{m}$  hole MCP
- Protective foil does prevent the aging considerably, but Npe loss is a factor of 2
- GaAsP photocathode has much higher QE and in the “red” region  
-> smaller chromatic effects -> better timing resolution

# Expected performance

A photon is accepted if:  $TOP_i^{\text{measured}} - TOP_i^{\text{expected}} < \text{Cut}$

$$\sigma \sim \sigma_{\text{Electronics}} \otimes \sigma_{\text{Chromatic}} / \sqrt{N_{pe}} \otimes \sigma_{\text{TTS}} / \sqrt{N_{pe}} \otimes \sigma_{\text{T0}}$$

$$N_{pe} \sim 40\text{-}50/\text{cm} \quad * \quad \boxed{1/2} \quad * \quad 1/3 \quad * \quad 1.2 \text{ cm} \quad \sim \quad 9$$

(Bialkali QE)      (foil)      (acceptance)      (radiator thickness)

Assume:

$$\sigma_{\text{TTS}} \sim 35 \text{ ps} , \sigma_{\text{Electronics}} \sim 10 \text{ ps} , \sigma_{\text{Chromatic}} \sim 20 \text{ ps} , \sigma_{\text{T0}} \sim 15 \text{ ps}$$

$$\Rightarrow \text{Expect: } \sigma \sim \sqrt{(10^2 + (20/3)^2 + (35/3)^2 + 15^2)} \sim 20 \text{ ps}$$

# Expected rates

## SuperB expectation:

Track rate in the forward region:  $\sim 2 \text{ kHz} / \text{cm}^2 \sim 6.3 \times 10^9 / \text{mm}^2 / 10 \text{ years}$

$\Rightarrow$  Expected pixel rate:

$\sim 2 \text{ kHz} / \text{cm}^2 \times 24 \text{ cm} \times 30 \text{ cm} \times (1/2) \times (1/3 \times 50) \text{ pe/track} \times (1/16) \sim 0.75 \text{ MHz/pixel}$

**This may be pushing the MCP-PMT rate limit.**

**$\Rightarrow$  One may have to use pixilated approach**

**At the end, the only design  
which might work reliably is a  
highly pixilated type**

# “Pixilated” TOF counter running at low gain

## Numbers:

### 10mm thick qtz radiator

~ 7200 quartz cubes - total

~ 7200 pixels - total

~ 450 MCP-PMTs - total

1 ASIC chips/MCP-PMT

~ 450 ASIC chips - total

16 pixels/MCP-PMT

1 fiber cable/ASIC

~ 450 fiber cables - total

1 HV cable/5 MCPs

~ 90 HV cables - total

$r_{\min} \sim 50 \text{ cm}$  ( $\theta \sim 15\text{-}16^\circ$ )

$r_{\max} \sim 80 \text{ cm}$  ( $\theta \sim 25^\circ$ )

$\Delta r \sim 30 \text{ cm}$

Total area:  $\sim 12,300 \text{ cm}^2$

Req.pos. accuracy:  $\sim 0.5 \text{ mm}$

Hang it off EMC support ?

~\$3k/MCP-PMT ?

~1.35 M\$ - total detectors

## Quartz cubes radiators:

## Total cable plant:

- 450 fibers
- 50 HV & LV cables

Photonis MCP-PMT with 64 pixels

## Arguments for it:

- very low gain of  $\sim 2 \times 10^4$ .
- smaller aging rate ?
- good results in beam
- use all photons
- less complicated analysis

## Arguments against it:

- more channels.
- Not sure that we can get cables out
