

Final Focus latest developments

Alejandro Pérez

Eugenio Paoloni

INFN – Sezione di Pisa

LNFSuperB Workshop

Outline

- **Plug and Horseshoe implementation**
- **Beam pipes implementation from Mike Sullivan's design**
- **Detector Hall**
- **Bruno latest developments:**
 - Magnetic datacard
 - Rad-Bhabha: IP datacard
- **Summary**

New Final Focus (FF) mother volume (Fwd)

- Increased FF mother volume around 2.4 and 3.8 m taking care on not touching IFR mother volume

New FF mother volume (Bwd)

- Increased FF mother volume around -2.8 and -1.6 m taking care on not touching Bwd FDIRC mother volume

The Plug profile

- Use some BaBar drawings as reference for the dimensions
- Try to include particularities of SuperB design (FF tungsten shield)

The Horseshoe profile

- Use some BaBar drawings as reference for the dimensions
- Try to include particularities of SuperB design (FF tungsten shield)

Some plots (Fwd Plug)

Some plots (Fwd Plug)

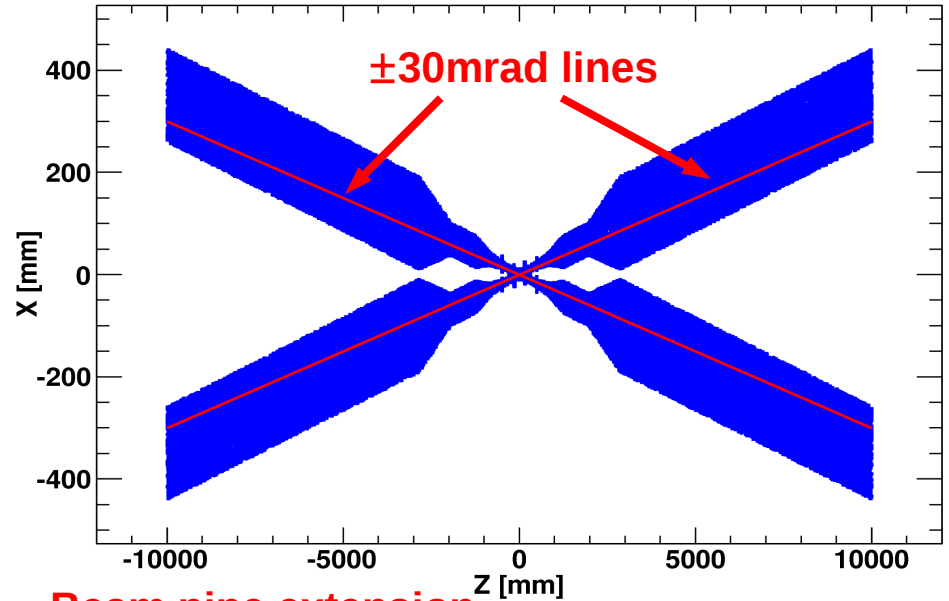

Some plots (Bwd Horseshoe)

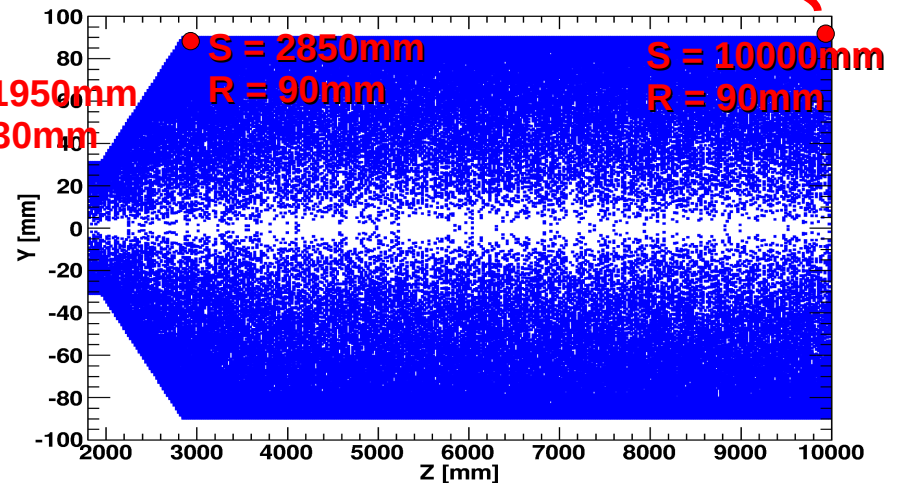

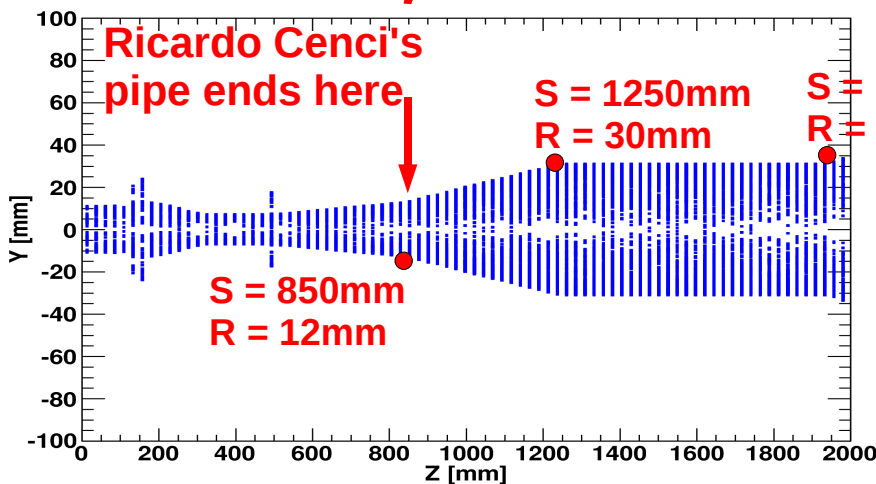

Previous beam pipes profile

Z vs X profile

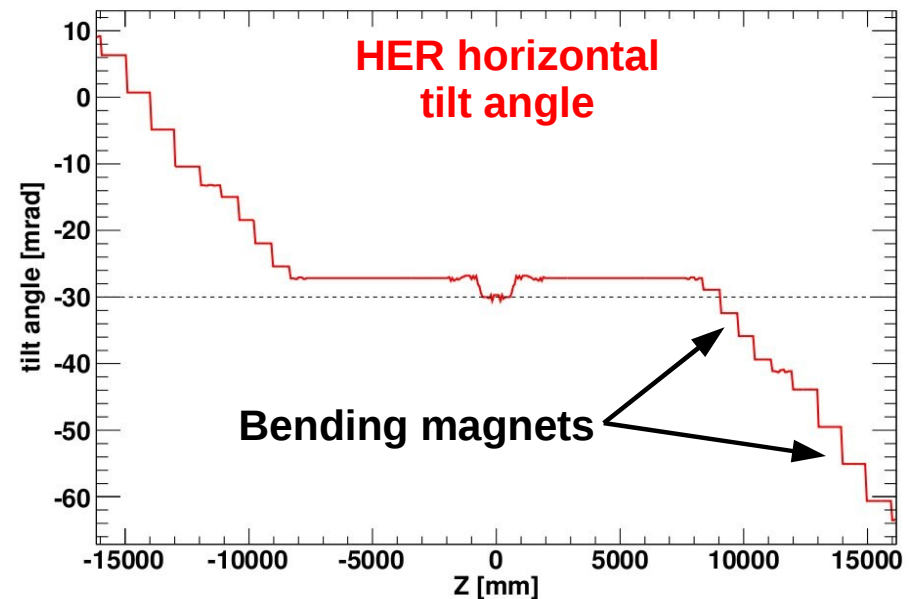

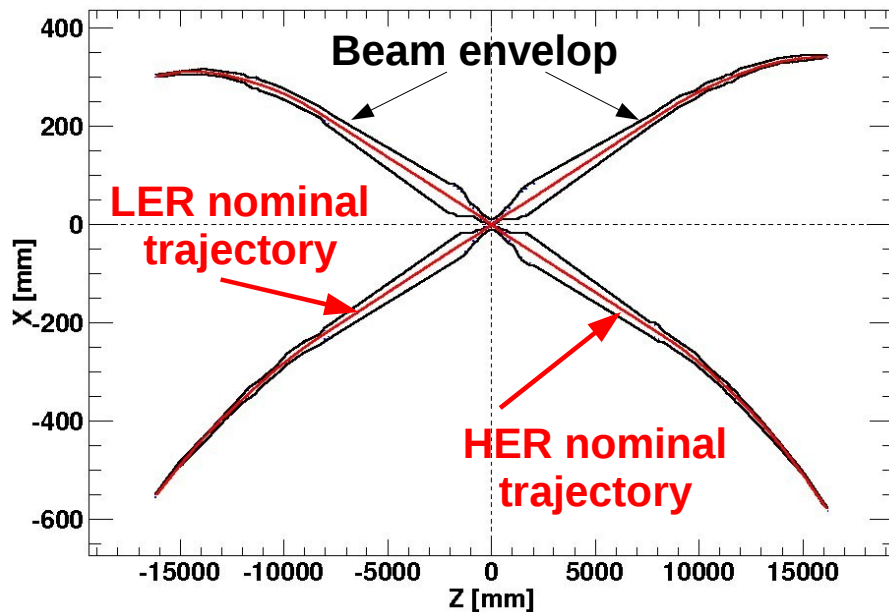

- Beam pipes tilt is higher (35mrad) than 30mrad
- Pipes up to up to $\pm 10\text{m}$ from IP
- Ad-hoc pipe profile. No precise model from Accelerator group design

Beam pipe extension

V12 SF11 nominal trajectories

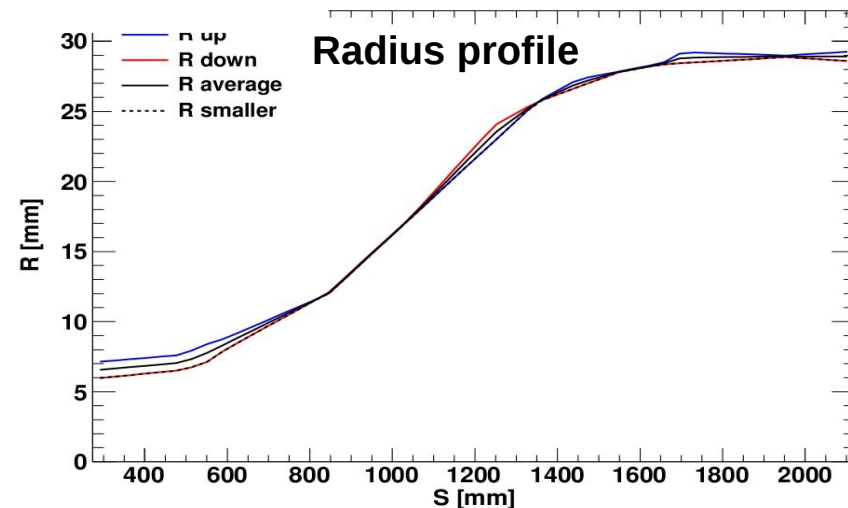

- Beam pipe design only up to ~ 2 m from IP
- After that only have beam envelop ($10 \times \sigma_x$ and $10 \times \sigma_y$ beam sizes) up to ± 16 m from IP
- Essentially two horizontal tilt before 1st bend:
 - 30 mrad near IP ($Z < 0.6$ m)
 - 27 mrad up to 1st bend
- Will try to use two straight sections for the beam pipe modeling

V12 SF11 beam pipes profile (I)

Mikes drawings

Radius profile

- Use Mike Sullivan's drawings as inputs (no information on the vertical dimensions)
- Out of that get:
 - Curves with the pipes walls
 - Calculate pipes radius profile as a function of distance to IP
- Use straight pipes with constant radius from 2.4 m on until 1st bend

V12 SF11 beam pipes X-Rays (I)

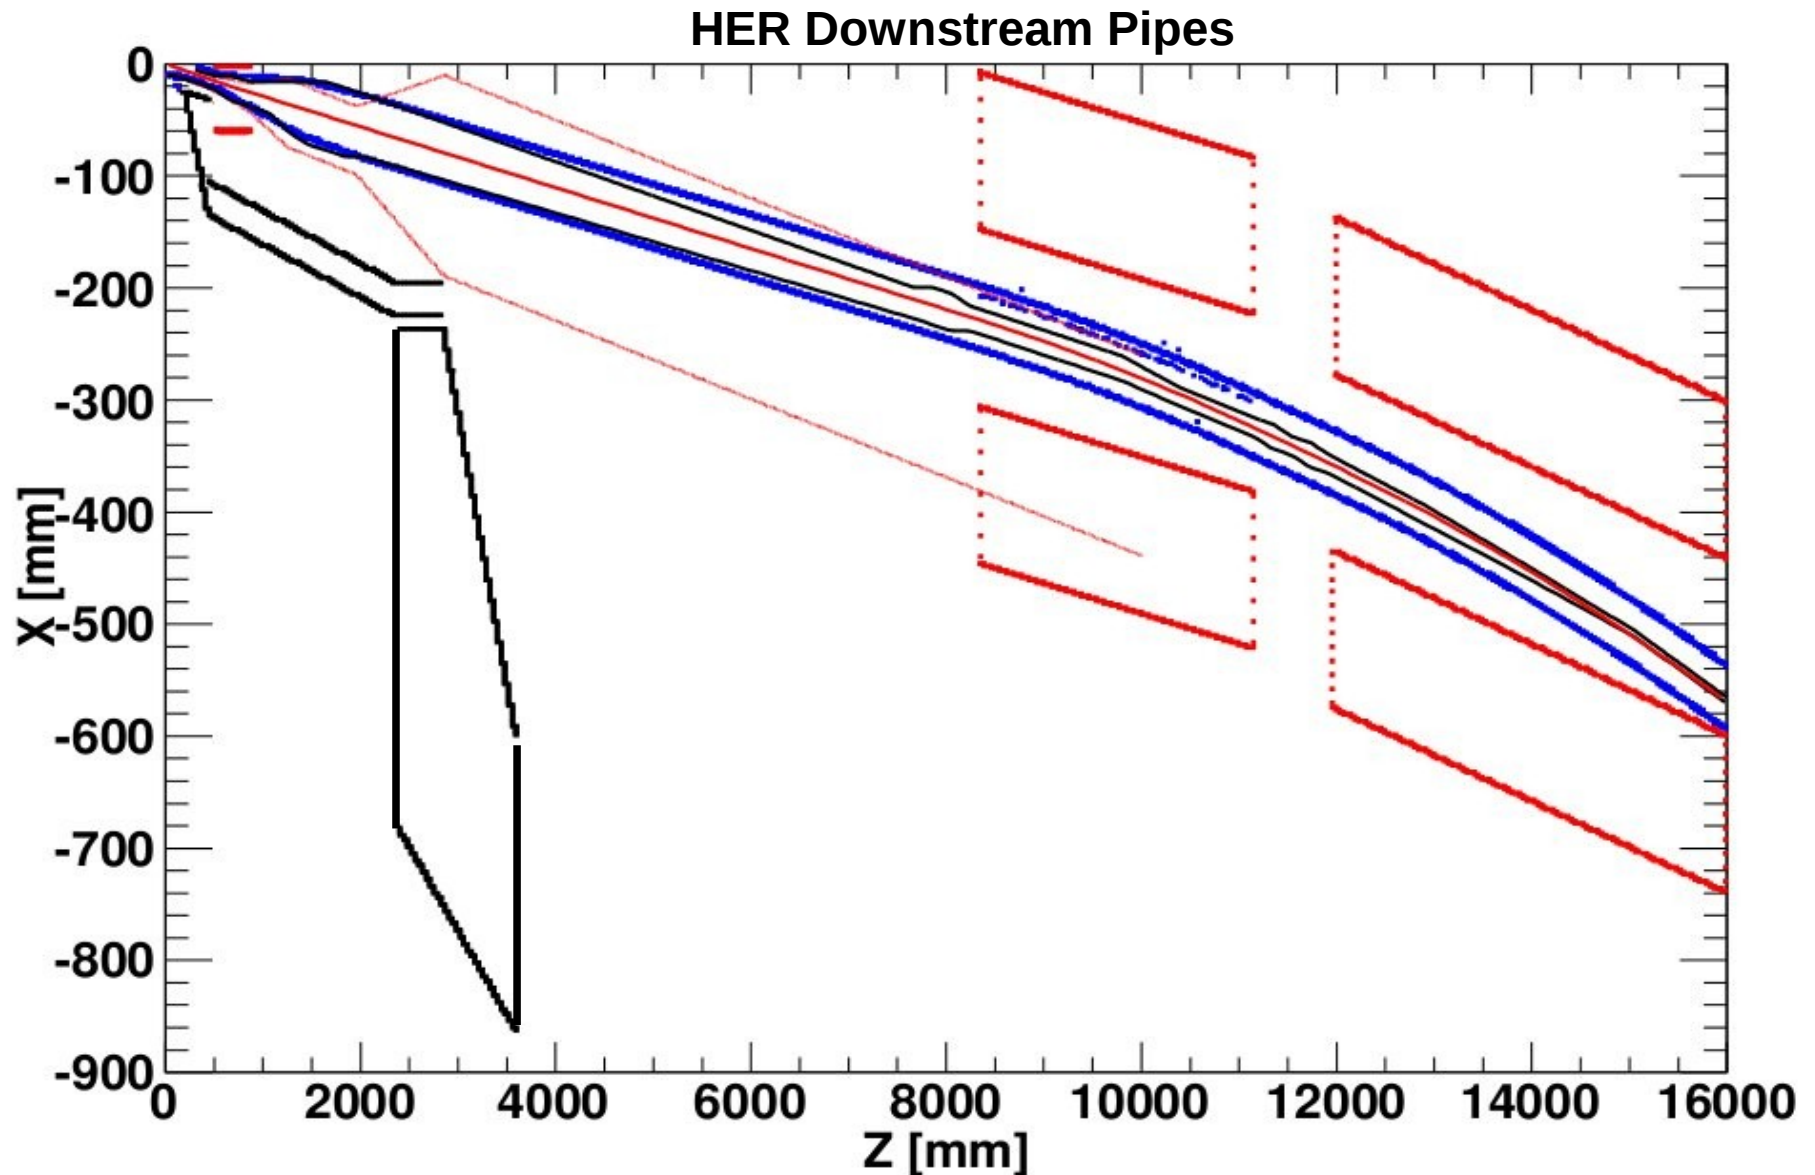

V12 SF11 beam pipes X-Rays (II)

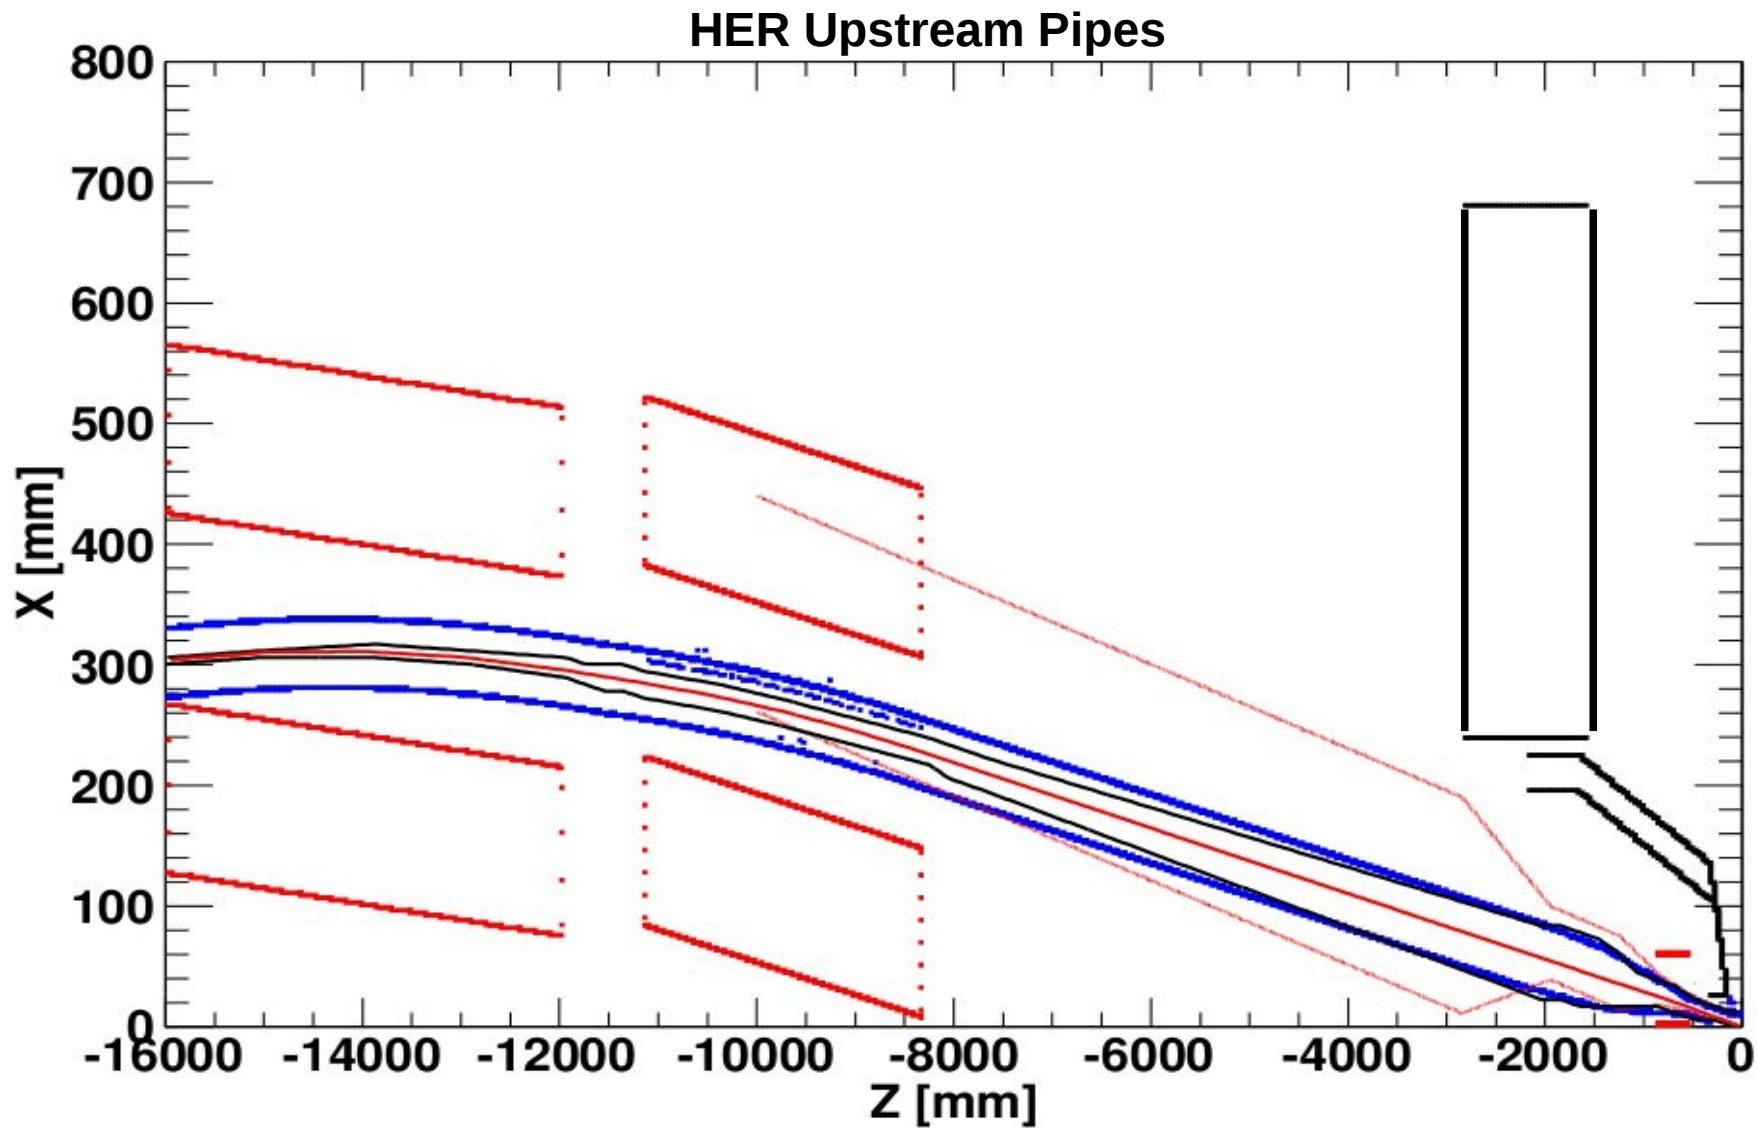

Central Pipes

V12 SF11 beam pipes X-Rays (III)

V12 SF11 beam pipes X-Rays (IV)

New beam pipes model in Bruno

Detector Hall

Bruno development: Magnetic IR

Previously:

- Final focus magnetic field was hard-coded inside Bruno
- Difficult to follow the evolution of the final focus design

Currently: (Need to document this in the wiki)

- Modified Bruno to use a magnetic layout input datacard
http://mailman.fe.infn.it/superbwiki/index.php/Bruno_Invocation
- Datacard structure: define a list of magnetic elements (cylinders)
- New parameters (**Radius_int**, **ConstantRadialBField**). Need final testing

BeginMagneticElement

Name QD0PA

StartPoint 0.899865 0. 29.9865 cm

EndPoint 0.929861 0. 30.9861 cm

Radius 0.899865 cm

Radius_int 0.4 cm (default is zero)

MagCenterPoint 0.914863 0. 30.4863 cm

MagAxisVector -0.0299955 0 -0.99955

Gradient -0.99955 0 0.0299955 139.12 tesla/m

ConstantBField 0 0 0 0 tesla

ConstantRadialBField 1.0 tesla (default is zero)

EndMagneticElement

Cylinder definition

Quadrupolar field

Constant B-field

Radially constant B-field

Bruno development: bbbrem IP parameters

- **Previously:** Bbbrem generator (Radiative Bhabha) needs beam IP parameters for luminosity calculation
 - IP parameters were hard-coded inside Bruno (src/BbbremGenerator.cc)
 - Difficult to follow the evolution of the final focus magnetic layout
- **Currently:** (Need to document this in the wiki)
 - bbbrem generator reads an input datacard with IP parameters (/generator/bbbrem/IPdatacard)
 - New parameter: IP location (**IP_coor**). Need final testing

HER parameters

her_energy	6.69	GeV
her_pdt	-11	
her_sigma_x	7.334e-3	mm
her_beta_x	26.0	mm
her_sigma_y	36.0e-6	mm
her_beta_y	253.0e-3	mm
her_sigma_z	5.0	mm
her_deltaEoE	1.0e-3	
her_alpha_z	-30.0e-3	
her_npart	5.08e+10	

LER parameters

ler_energy	4.18	GeV
ler_pdt	11	
ler_sigma_x	8.701e-3	mm
ler_beta_x	32.0	mm
ler_sigma_y	35.0e-6	mm
ler_beta_y	205.0e-3	mm
ler_sigma_z	5.0	mm
ler_deltaEoE	1.0e-3	
ler_npart	6.56e+10	

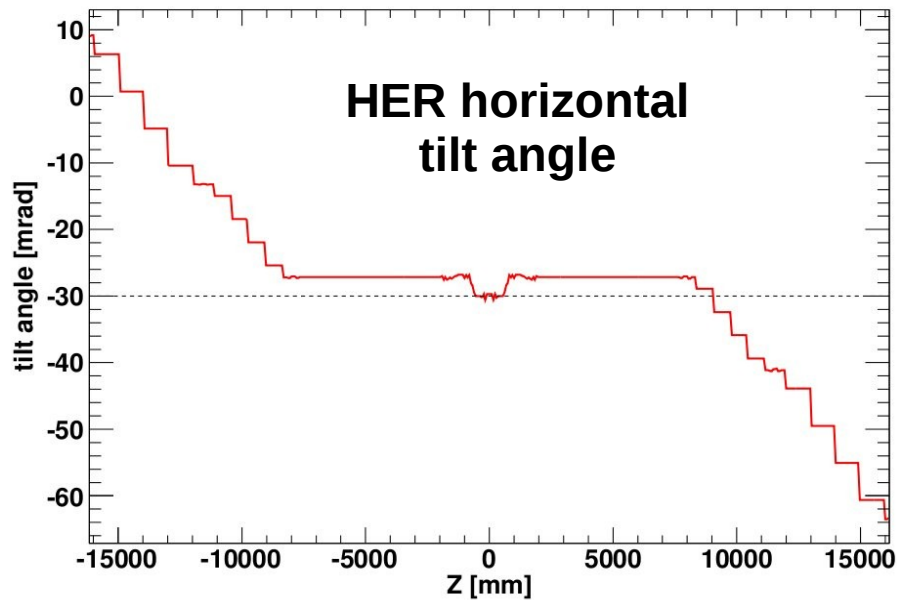

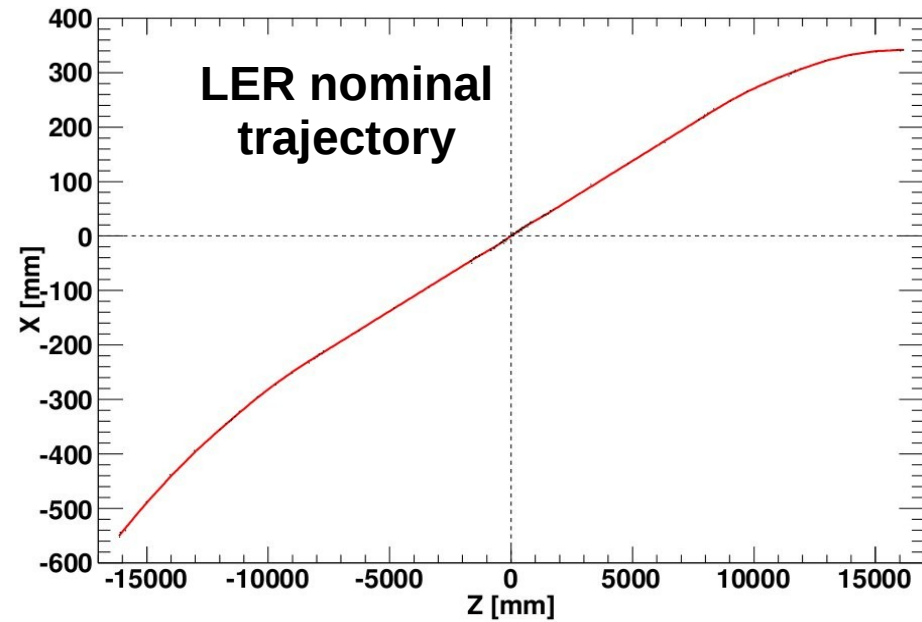

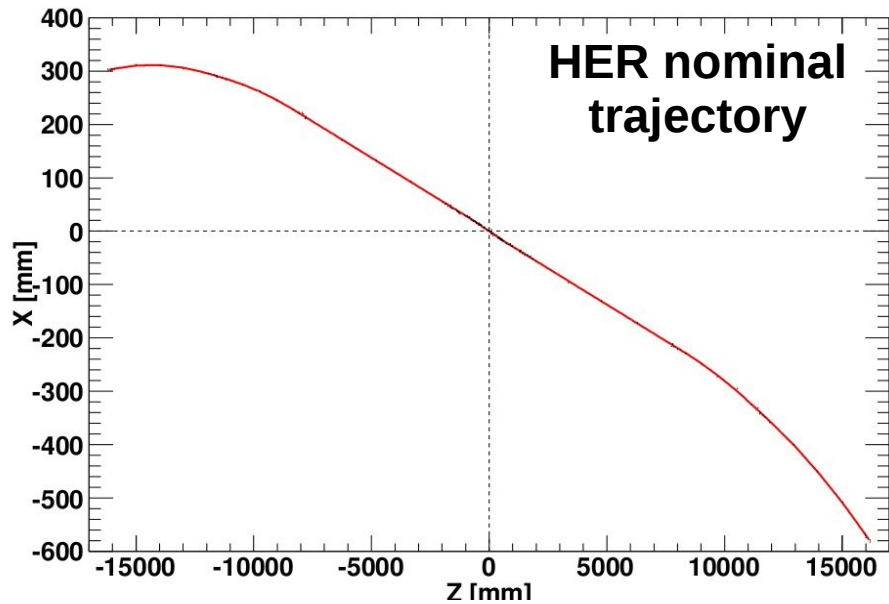

IP_coor 0.0 0.0 0.0 mm (default is (0,0,0))

Summary and outlook

- **Final focus is well shielded:** extended Tungsten shield, Plug and Horseshoe in place
- **Beam pipe profile:** simple approach gives good results,
 - Two straight section: 30mrad (< 0.6 m) and 27mrad (> 0.6)
 - Use Mike Sullivan's radius profile up to ~2m from IP
 - From that point on use constant radius pipes (29 mm)
 - Beam pipe modeled up to ± 16 m from IP (including bending magnets)
- **Detector hall:**
 - Concrete wall (polycone with simple profile)
 - Silicon scoring planes for FEE studies (Eugenio Paoloni)
- **Bruno developments:**
 - Magnetic datacard new parameters: internal radius and radially constant B-field
 - Rad-Bhabha generator IP datacard: new IP location parameters
- **Next steps:**
 - Implementation of magnetic elements material
 - Diag36 (2-photon background) generator inside Bruno
