

# Overview of recent experimental results on Particle Wake Field Acceleration

**Patric Muggli**

**Max Planck Institute for Physics, Munich**  
**University of Southern California, Los Angeles**  
**[muggli@mpp.mpg.de](mailto:muggli@mpp.mpg.de)**

Work supported by US Dept. of Energy

# OUTLINE

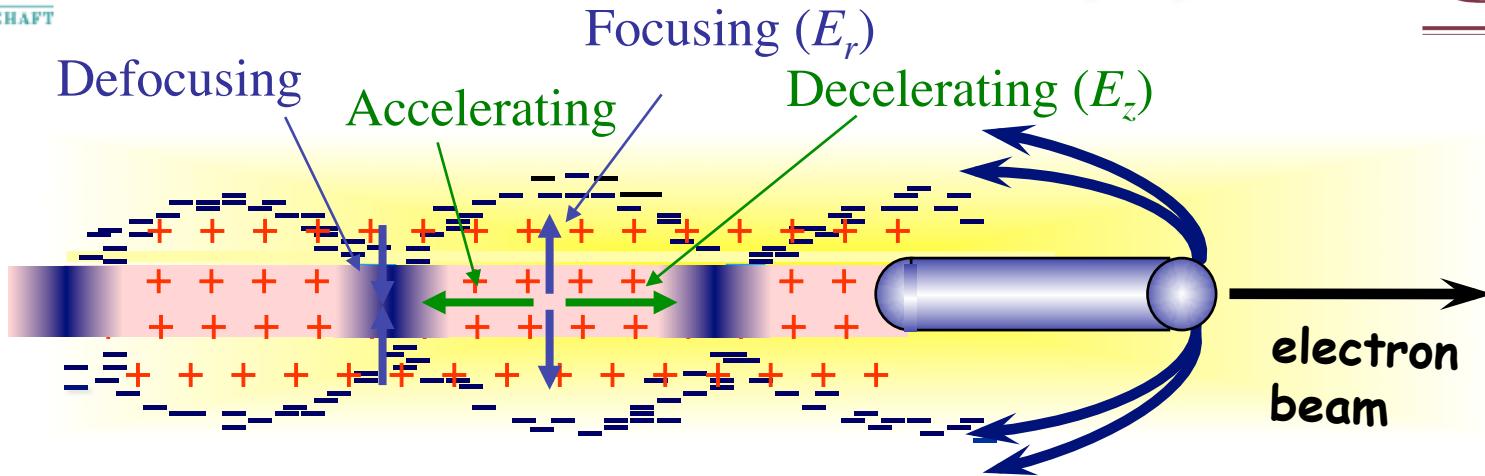

- ❑ Motivation-Introduction to PWFA
- ❑ PWFA experimental results @ SLAC
  - ❑ e<sup>-</sup> transverse dynamics, focusing, β-tron radiation
  - ❑ positrons
  - ❑ longitudinal dynamics, acceleration

*P. Muggli and M.J. Hogan, Comptes Rendus Physique, 10(2-3), 116 (2009).*

- ❑ Multi-bunch, low energy PWFA results @ ATF-BNL
  - ❑ Resonant excitation of plasma wakefields
- ❑ Future proton driven PWFA @ CERN
- ❑ Summary and Conclusions

# PLASMA WAKEFIELD ( $e^-$ )

- Plasma wave/wake excited by a relativistic particle bunch
- Plasma  $e^-$  expelled by space charge forces => energy loss + focusing
- Plasma  $e^-$  rush back on axis => energy gain
- Optimize for acceleration, focusing (plasma lens), radiation ( $\beta$ -tron)
- Plasma Wakefield Accelerator (PWFA): high-frequency, high-gradient, strong focusing, co-linear, beam-driven accelerator

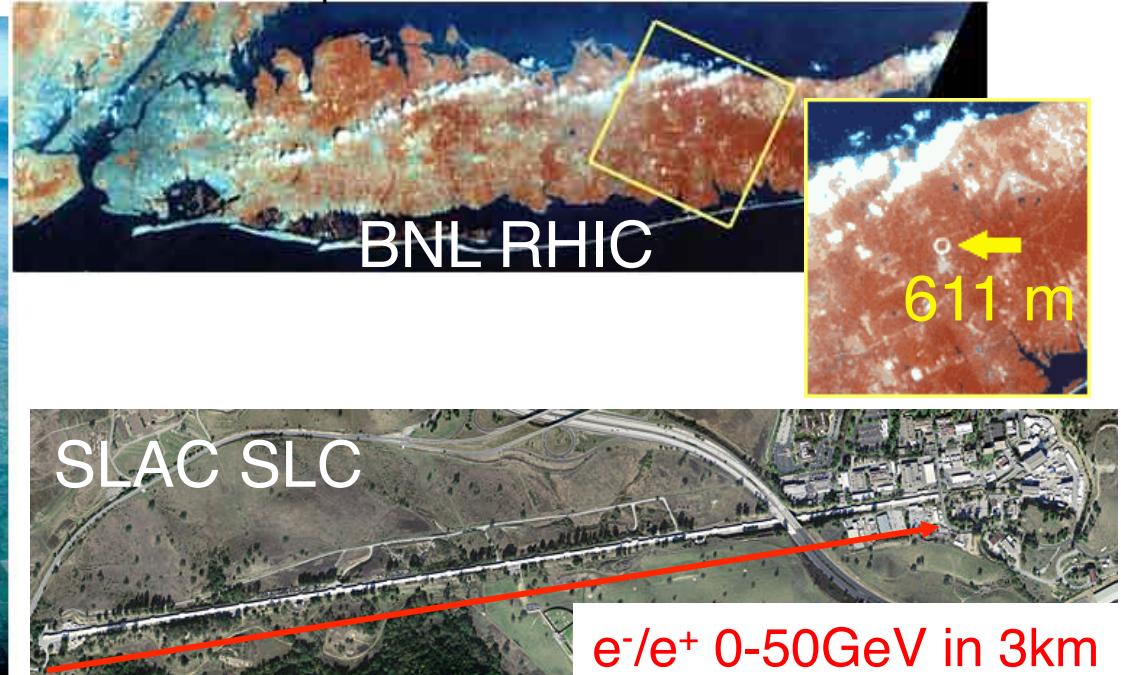

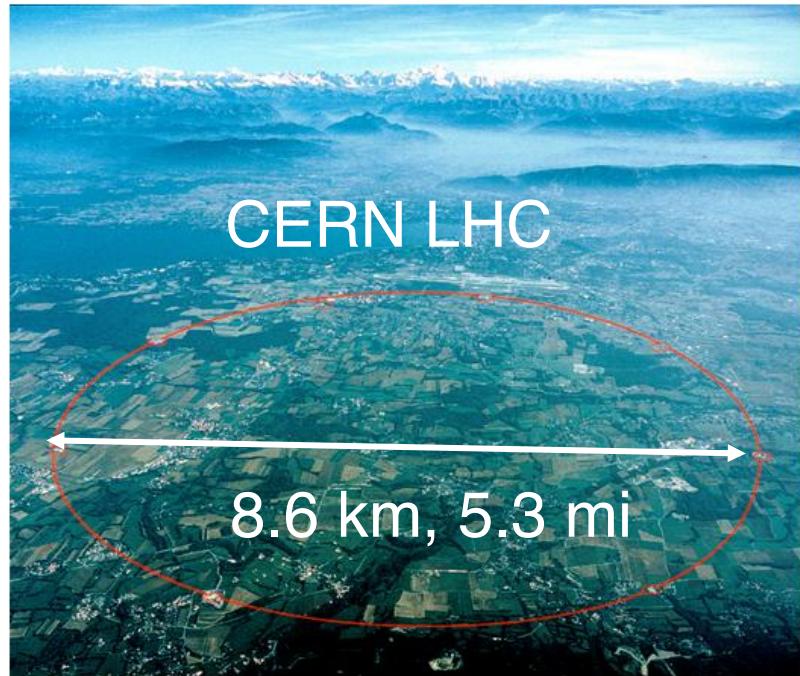

# PARTICLE ACCELERATORS

- ❑ We are at the verge of significant physics discoveries
  - ❑ LHC@CERN: Higgs boson, super-symmetric particles, dark matter, dark energy, ...
- ❑ Need precision machine (ie., lepton linear collider) to complement and further hadron collider discoveries
- ❑ SLAC-LCLS x-ray free electron laser (X-FEL) great success
- ❑ Short coherent x-ray pulses for biology, material science, warm dense mater, plasma studies, ...
- ❑ X-FEL mushrooming: LCLS-2, DESY-Europe, Japan, Switzerland, ...
- ❑ Continued interest in accelerators for basic science, technology, medicine, ...
- ❑ But ...

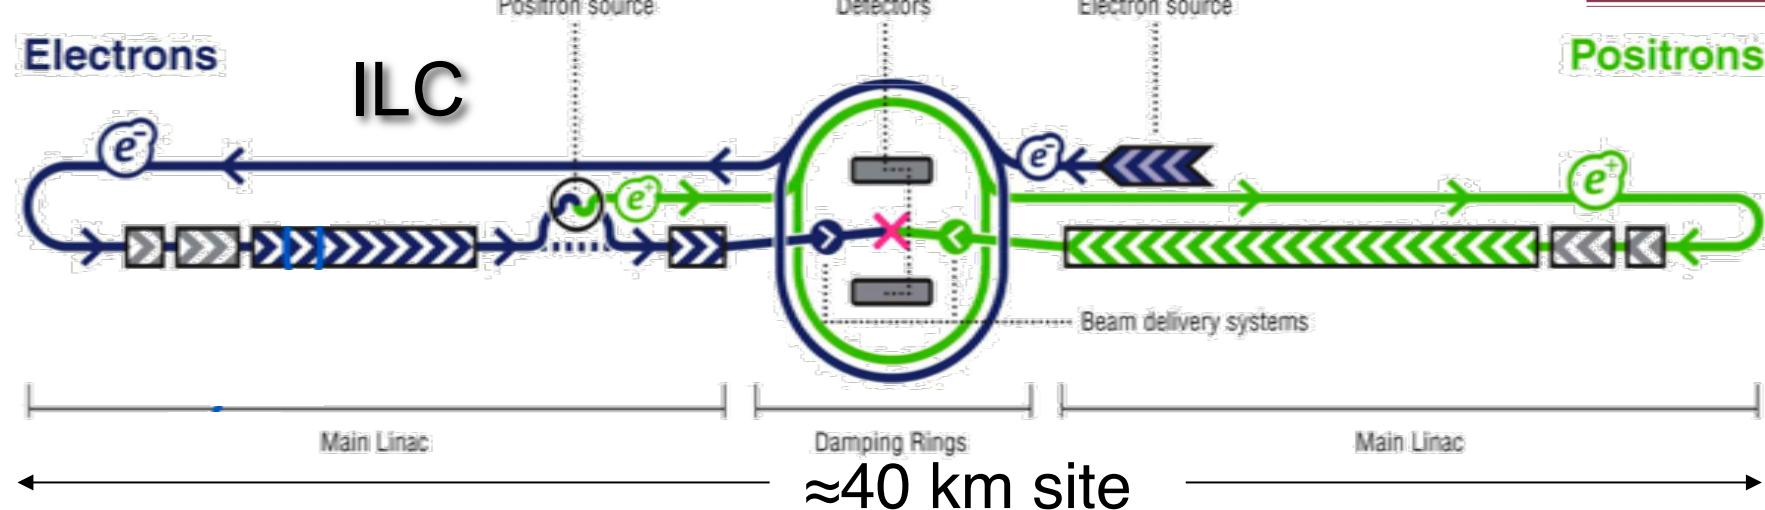

# PARTICLE ACCELERATORS

- Some of the largest and most complex (and most expensive) scientific instruments ever built!
- All use rf technology to accelerate particles
- Can we make them smaller (and cheaper) and with a higher energy?

# FUTURE LEPTON ( $e^-/e^+$ ) COLLIDER

- Linear accelerator to avoid synchrotron radiation limitation  
( $\sim \gamma^4/r^2 \sim E^4/m^4 r^2$ )
- Energy frontier: 1-3 TeV,  $e^-/e^+$
- Accelerator length with (cold) rf technology:

$$\frac{1 \text{ TeV}}{<50 \text{ MeV/m}} > 20 \text{ km/side!}$$

<150MV/m?

Is there a high-gradient alternative to rf technology?  
Plasmas?

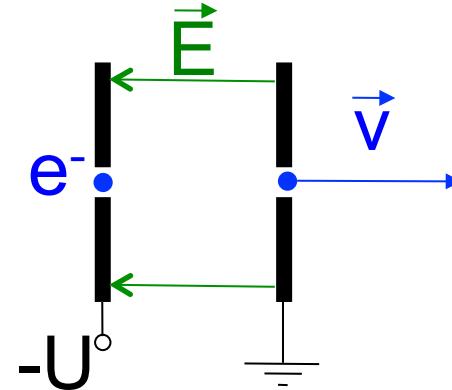

# PARTICLE ACCELERATION

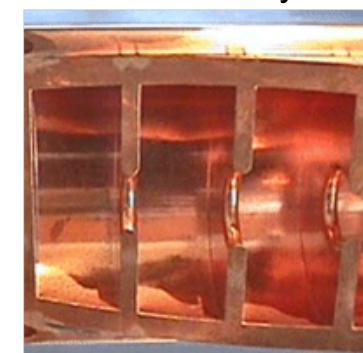

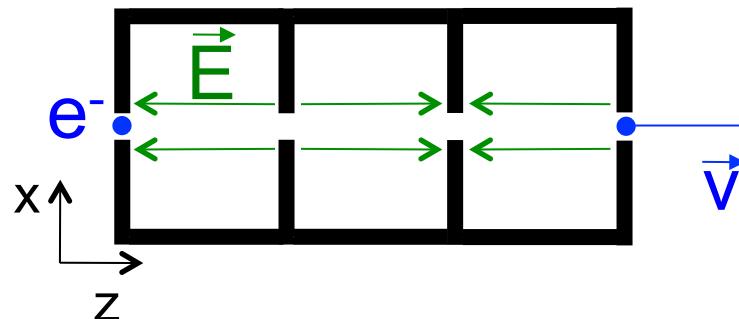

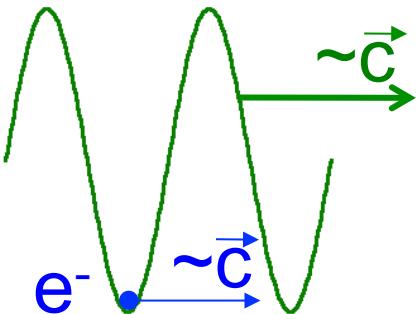

Requirements:

→ Longitudinal (// to motion) electric field

DC field limited by breakdown

→ Wave traveling at the particle velocity ( $v_\phi \sim v_b \sim c$ )

$E_z \Rightarrow$  TM cavity mode

Pillbox accelerating structure

Slow wave structure

# WHAT ABOUT PLASMAS?

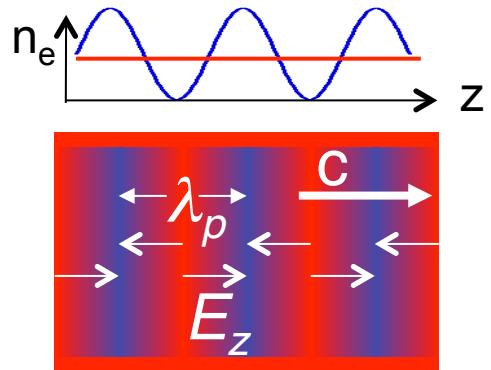

→ Relativistic Electron Plasma Wave (Electrostatic,  $E_z$ ):

$$\vec{\nabla} \cdot \vec{E} = \frac{\rho}{\epsilon_0} \quad k_p E_z = \frac{\omega_{pe}}{c} E_z = \frac{n_e e}{\epsilon_0}, \quad \omega_{pe} = \left( \frac{n_e e^2}{\epsilon_0 m_e} \right)^{1/2}$$

$$E_z = \left( \frac{m_e c^2}{\epsilon_0} \right)^{1/2} \quad n_e^{1/2} \cong 100 \sqrt{n_e (cm^{-3})} = 1 \text{ GV/m}$$

“Cold Wavebreaking” Field

$$n_e = 10^{14} \text{ cm}^{-3}$$

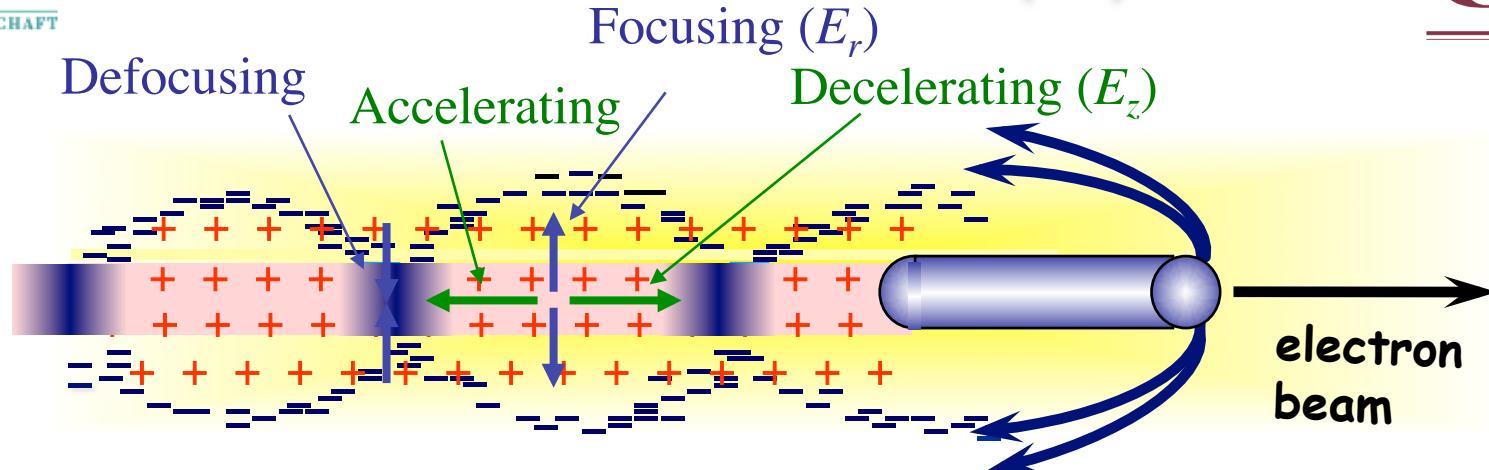

LARGE  
Collective response!

- Plasmas can sustain very large (collective)  $E_z$ -field, acceleration
- Wave, wake phase velocity = driver velocity ( $\sim c$ !)
- Plasmas are already (partially) ionized, difficult to “break-down”
- High gradient, high energy plasma accelerator? Yes!
- Plasmas wave or wake can be driven by:
  - Intense laser pulses (LWFA)
  - Short particle bunch (PWFA)

# PWFA NUMBERS ( $e^-$ )

→ Linear theory  
( $n_b \ll n_e$ ) scaling:

$$E_{acc} \approx 110(MV/m) \frac{N/2 \times 10^{10}}{(\sigma_z / 0.6mm)^2} \approx N/\sigma_z^2$$

@  $k_{pe}\sigma_z \approx \sqrt{2}$  (with  $k_{pe}\sigma_r \ll 1$ )

→ Focusing strength:  $\frac{B_\theta}{r} = \frac{1}{2} \frac{n_e e}{\epsilon_0 c} = 3kT/m \times n_e (10^{14} cm^{-3})$  ( $n_b > n_e$ )

→  $N=2 \times 10^{10}$ :  $\sigma_z = 600 \mu m$ ,  $n_e = 2 \times 10^{14} cm^{-3}$ ,  $E_{acc} \sim 100 MV/m$ ,  $B_\theta/r = 6 kT/m$   
 $\sigma_z = 20 \mu m$ ,  $n_e = 2 \times 10^{17} cm^{-3}$ ,  $E_{acc} \sim 10 GV/m$ ,  $B_\theta/r = 6 MT/m$

→ Conventional accelerators:  $E_{acc} < 150 MV/m$ ,  $B_\theta/r < 2 kT/m$

Acceleration of electrons by 42GeV in 85cm of plasma!

Excellent understanding of the PWFA ( $e^-$ )

Demonstrated the acceleration and focusing of positrons by plasmas

Acceleration of a bunch with finite energy spread

Emittance preservation

High-gradient acceleration of high quality positrons

High energy efficiency acceleration

Staging (or not!)

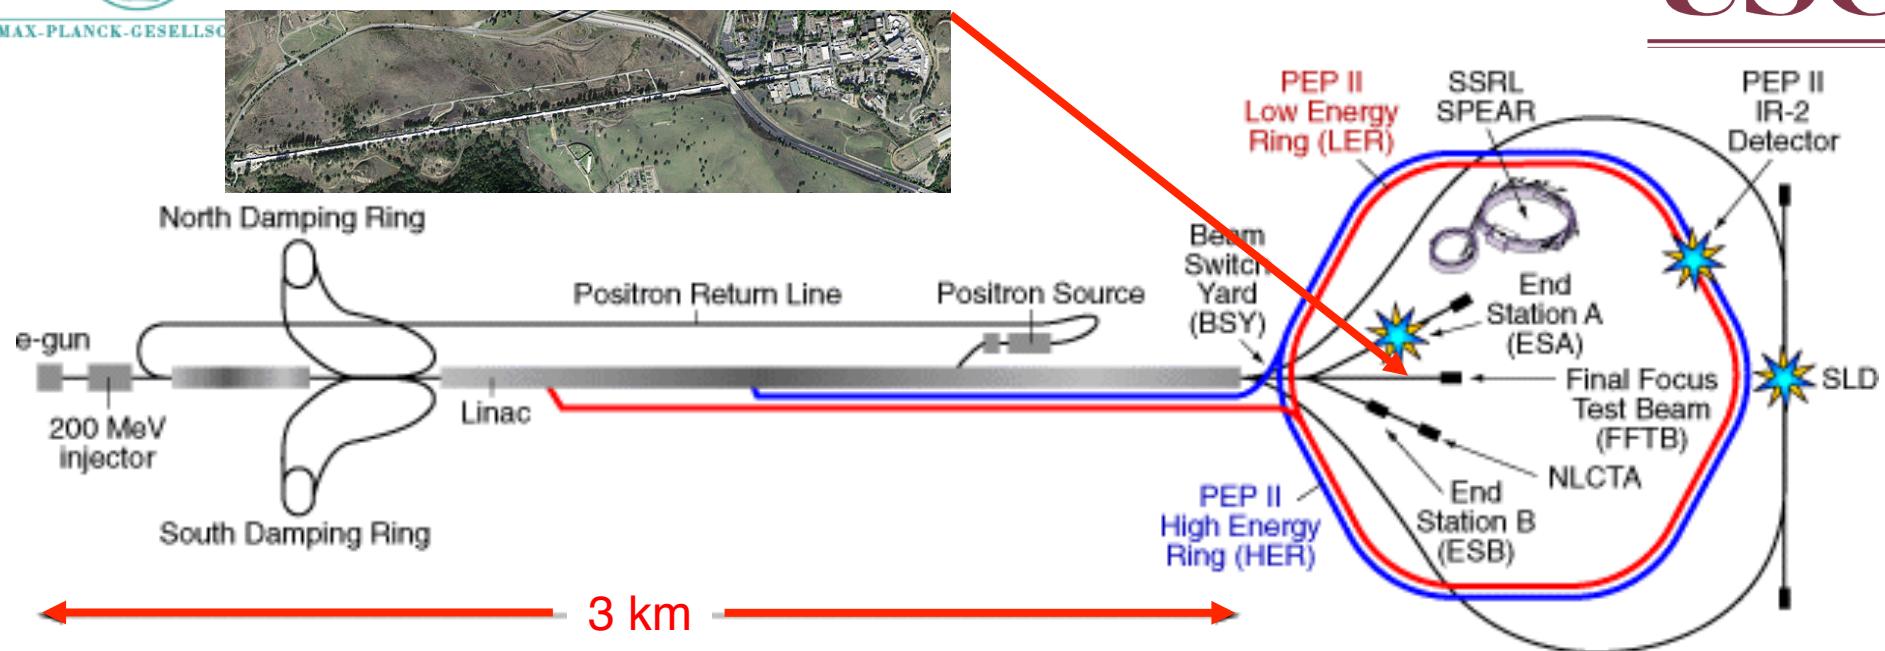

Build a PWFA-based linear collider

MAX-PLANCK-GESELLSCHAFT

# PWFA EXPERIMENTS @ SLAC

## Long-bunch Experiments

$e^-/e^+$  28.5 GeV

$\sigma_z \approx 700 \mu\text{m}$

$\sigma_r \approx 30 \mu\text{m}$

$n_e \approx 2 \times 10^{14} \text{ cm}^{-3}$

$L_p \approx 1.4 \text{ m}$

Pre-ionized

$N \approx 1.2-1.8 \times 10^{10}/\text{bunch}$

$k_{pe}\sigma_z \approx \sqrt{2}$

$0.1-50 \text{ GV/m}$

## Short-bunch experiments

$e^-$  28.5, 42 GeV

$\sigma_z \approx 30-20 \mu\text{m}$

$\sigma_r \approx 10 \mu\text{m}$

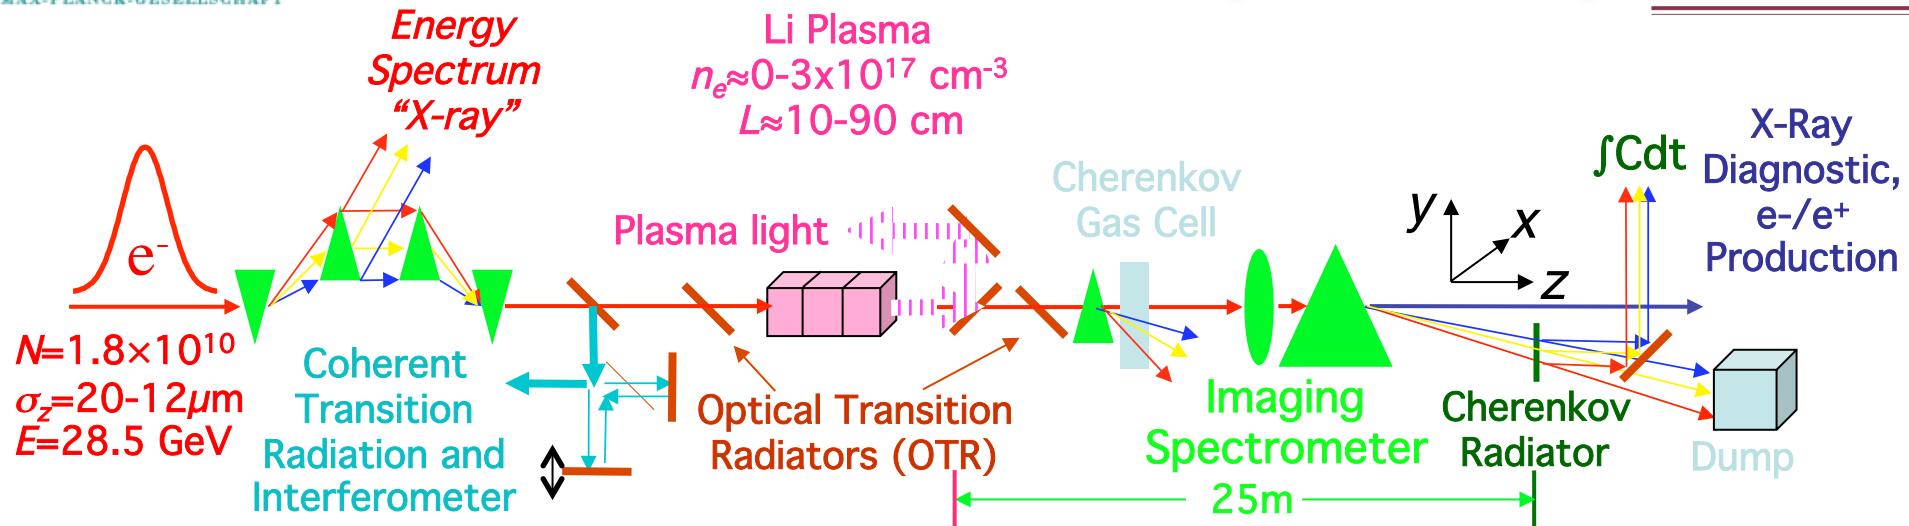

$n_e \approx 1-3 \times 10^{17} \text{ cm}^{-3}$

$L_p \approx 10, 20, 30, 60, 90, 120 \text{ cm}$

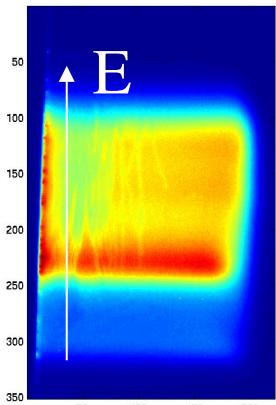

Field-ionized

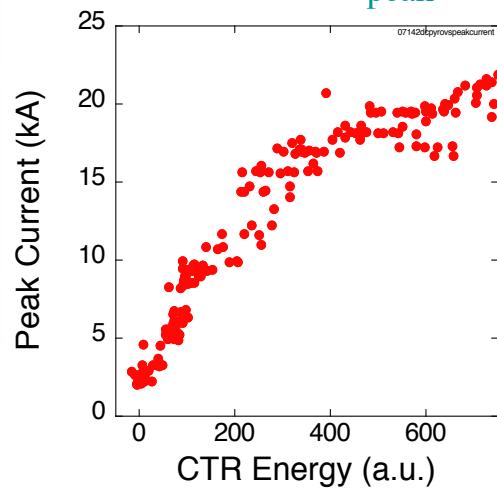

# EXPERIMENTAL SET UP (GENERIC)

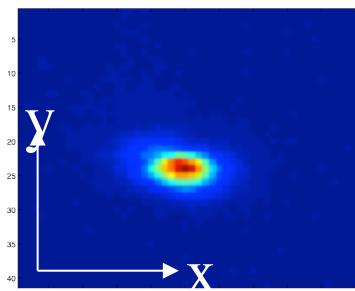

- X-ray Chicane

- Coherent Transition Radiation (CTR)
- CTR Energy  $\approx I_{\text{peak}} \approx 1/\sigma_z$

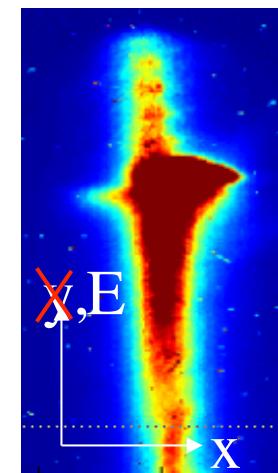

- OTR

- Spatial resolution  $\approx 9 \mu\text{m}$

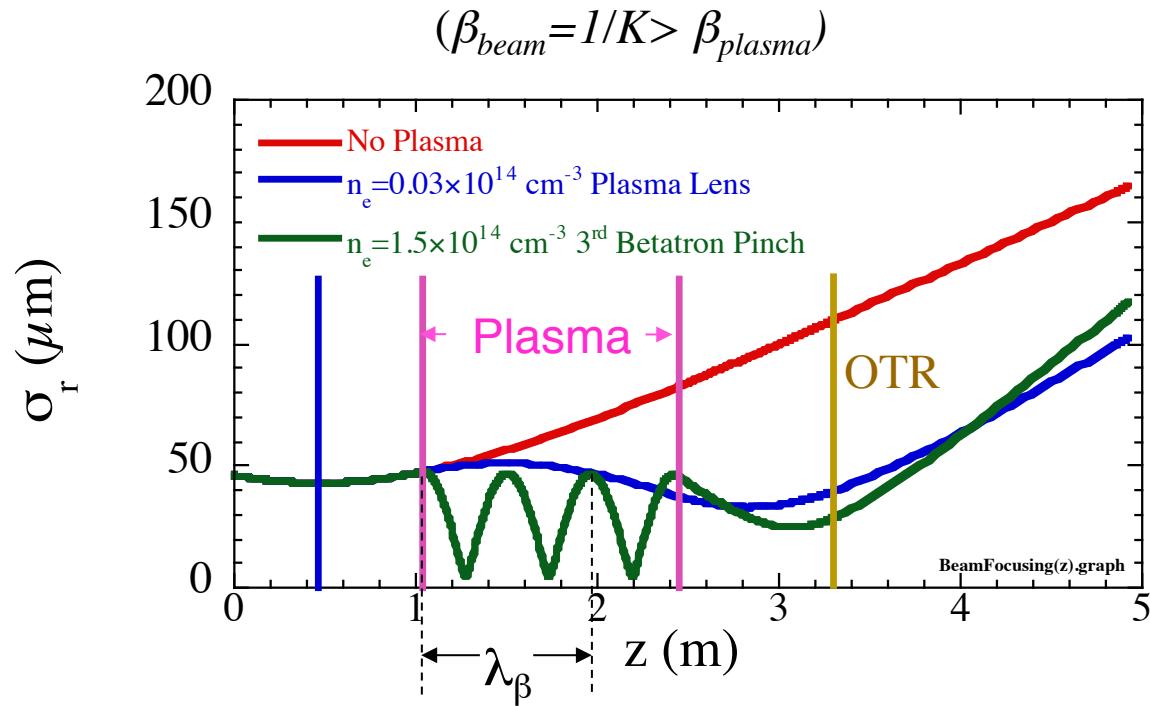

- Cherenkov (aerogel)
- Spatial resolution  $\approx 100 \mu\text{m}$
- Energy resolution  $\approx 30 \text{ MeV}$

# PLASMA FOCUSING OF $e^-$

## Beam Envelope Model for Plasma Focusing

Plasma Focusing Force > Beam “Emittance Force”

Envelope equation:

$$\frac{\partial^2 \sigma}{\partial z^2} + K^2 \sigma = \frac{\varepsilon^2}{\sigma^3}$$

In an ion channel:

$$K = \frac{\omega_{pe}}{\sqrt{2\gamma c}} \propto (n_e)^{1/2}$$

with a focusing strength:

$$W = \frac{E_r}{rc} = \frac{B_\theta}{r} = \frac{1}{2} \frac{n_e e}{\varepsilon_0 c}$$

$$= 6 \text{ kT/m}$$

$$@ n_e = 2 \times 10^{14} \text{ cm}^{-3}$$

$$= 6 \text{ MT/m}$$

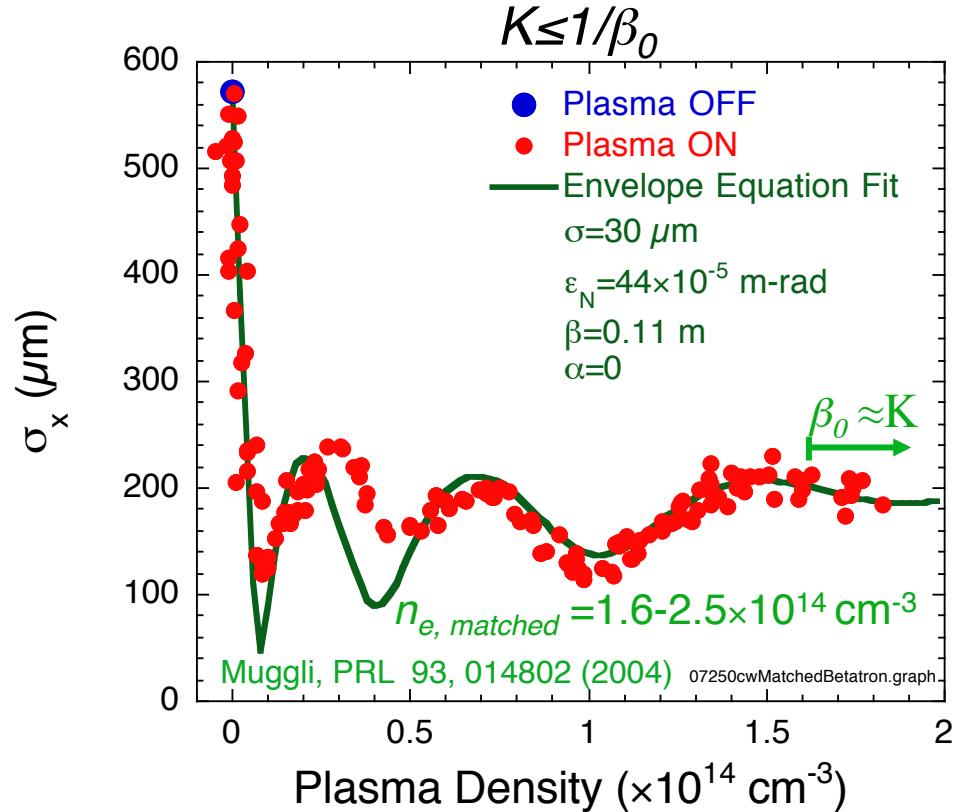

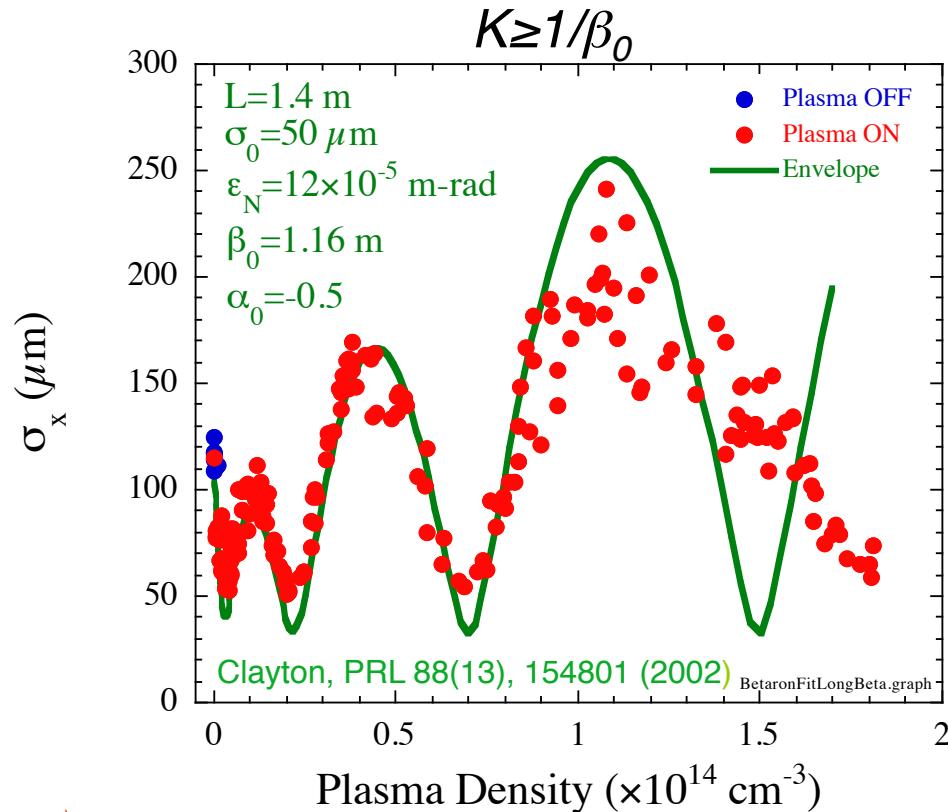

$$@ n_e = 2 \times 10^{17} \text{ cm}^{-3}$$

- ➡ Multiple foci (betatron oscillation) within the plasma
- ➡  $\sigma_{x,y}(z)$  at fixed  $n_e \Rightarrow \sigma_{x,y}(n_e)$  at fixed  $z$
- ➡ Betatron radiation!

# FOCUSING OF $e^-$

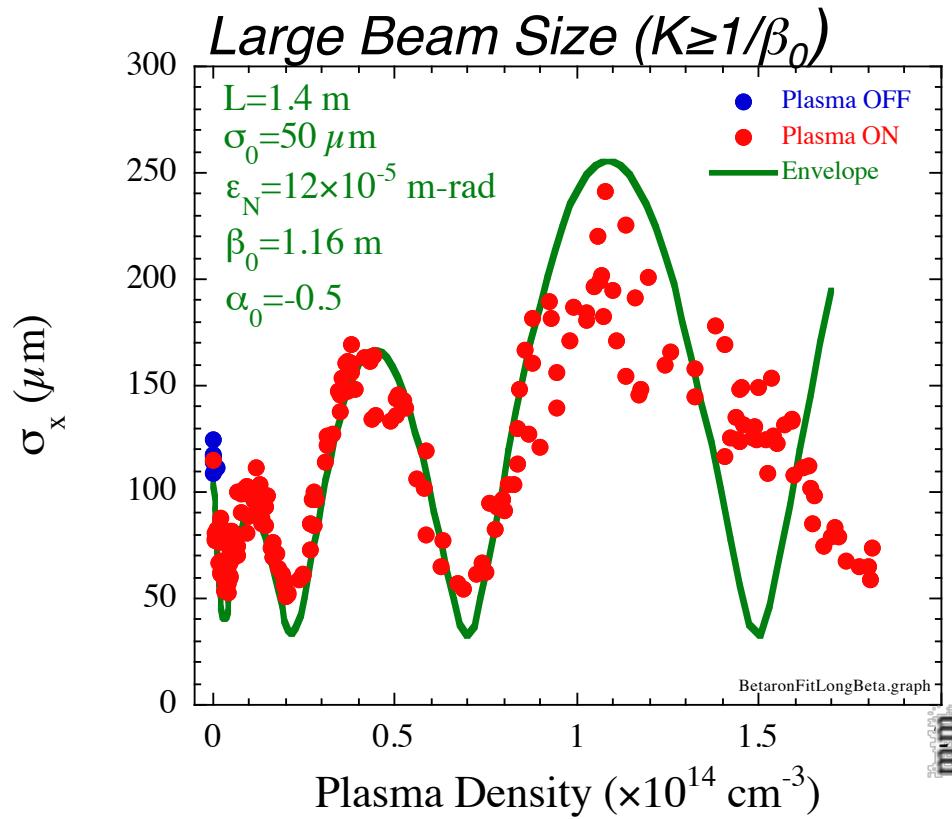

OTR Images  $\approx 1\text{m}$  downstream from plasma

- Focusing of the beam well described by a simple model ( $n_b > n_e$ ): **Plasma** = **Ideal Thick Lens**
- No emittance growth observed as  $n_e$  is increased
- Stable propagation over  $L=1.4\text{ m}$  up to as  $n_e = 1.8 \times 10^{14} \text{ cm}^{-3}$
- Channeling of the beam over  $1.4\text{ m}$  or  $> 12\beta_0$
- => **Matched Propagation over long distance!**

# $\beta$ -TRON RADIATION IN PLASMAS

$\hbar\omega_c \approx \text{keV}$    >6x10<sup>5</sup> photons @ 14.2±0.014 keV

◆ x-rays from a plasma wiggler ( $e^-$ )

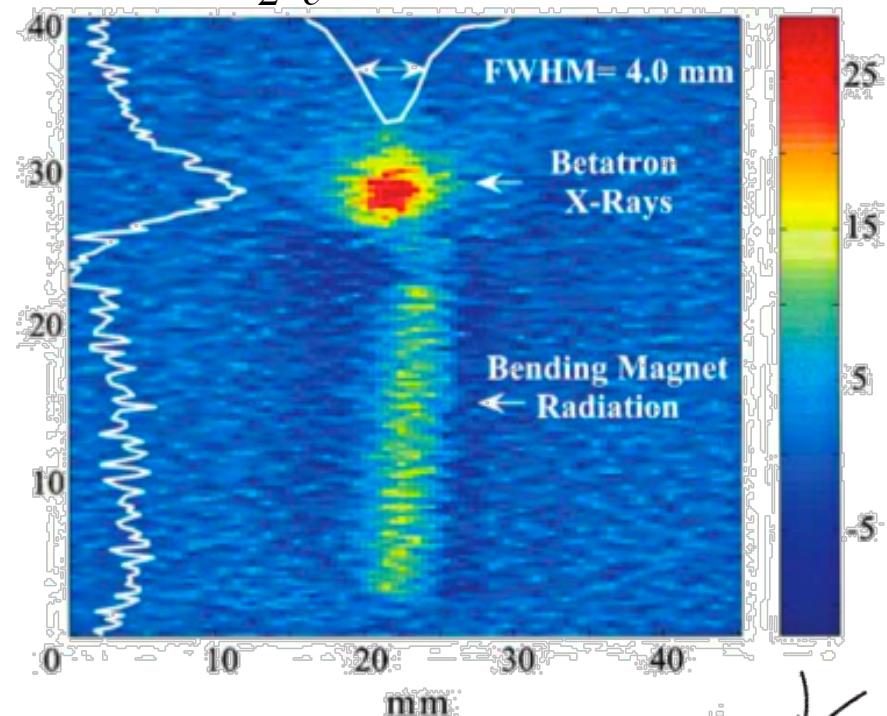

◆ ~10keV @  $n_e \sim 10^{14} \text{ cm}^{-3}$ , ~10MeV @  $n_e \sim 10^{17} \text{ cm}^{-3}$    Johnson, PRL 97, 2006

Wang, PRL 88, 2002

Ion column:

$$\lambda_\beta = \frac{\sqrt{8\gamma}\pi c}{\omega_{pe}} \propto \frac{1}{n_e^{12/2}}$$

$$\omega_c = \frac{3}{2} \frac{\gamma^3}{c} \omega_\beta^2 \sigma_r \propto n_e$$

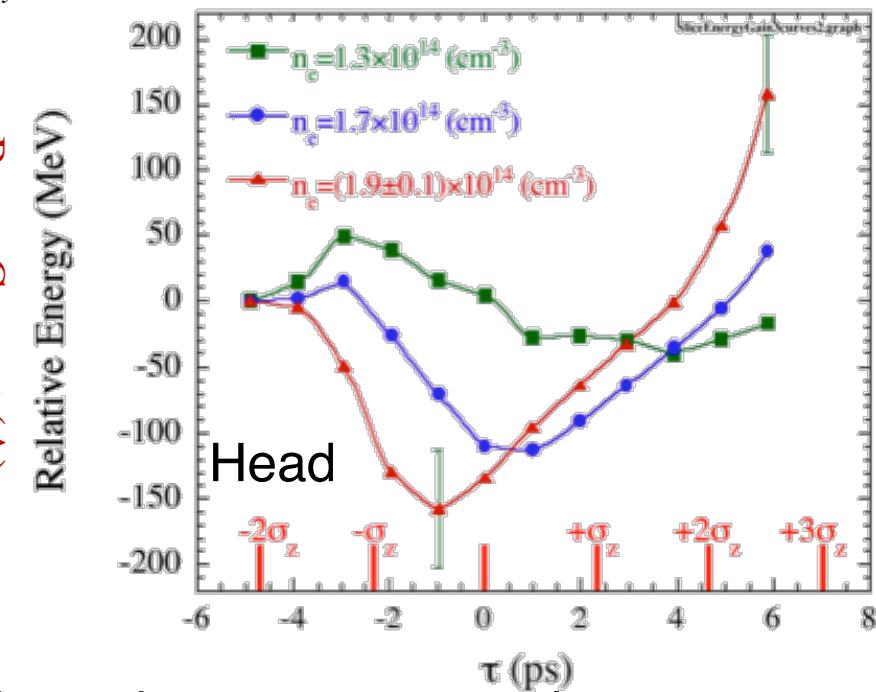

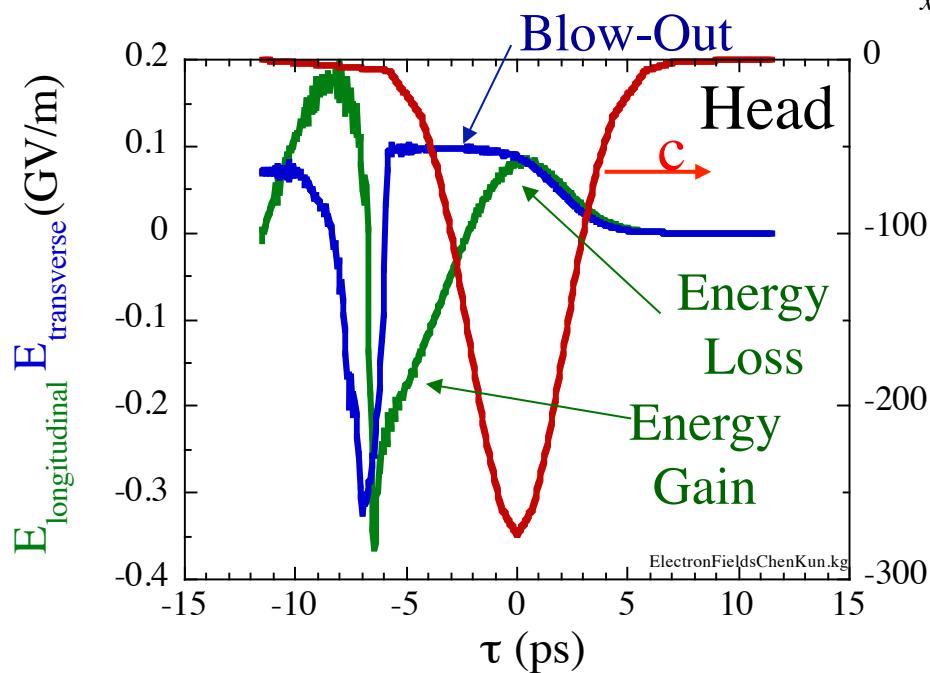

# PLASMA WAKEFIELD FIELDS ( $e^-$ )

Muggli, Phys. Rev. Lett. 93, 014802 (2004).

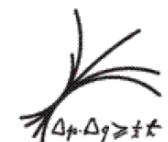

2-D PIC Simulation QUICPICK

$$n_e = 1.5 \times 10^{14} \text{ cm}^{-3}, N = 1.8 \times 10^{10} e^-$$

$E_0$	28.5 GeV	$n_b$	$4 \times 10^{14} \text{ cm}^{-3}$
$N$	$2 \times 10^{10} e^- \text{ or } e^+$	$\epsilon_{xN}$	$5 \times 10^{-5} \text{ m-rad}$
$\sigma_z$	0.63 mm (2.1 ps)	$\epsilon_{yN}$	$0.5 \times 10^{-5} \text{ m-rad}$
$\sigma_x = \sigma_y$	70 $\mu\text{m}$		

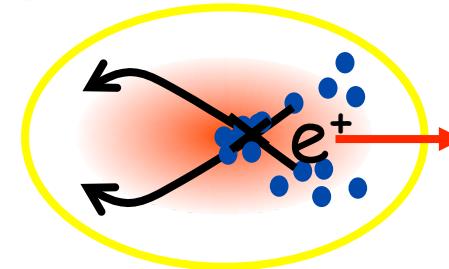

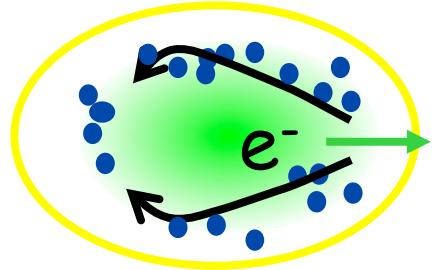

- Energy gain smaller than, hidden by, incoming energy spread
- Time resolution needed, but **shows the physics**
- Peak energy gain: 279 MeV, L=1.4 m,  $\approx 200 \text{ MeV/m}$

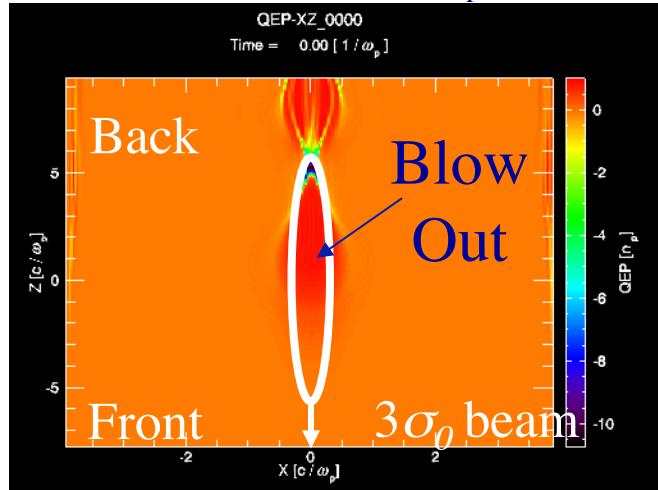

# e<sup>-</sup> & e<sup>+</sup> BEAM

◆ Transverse dynamics, emittance preservation?

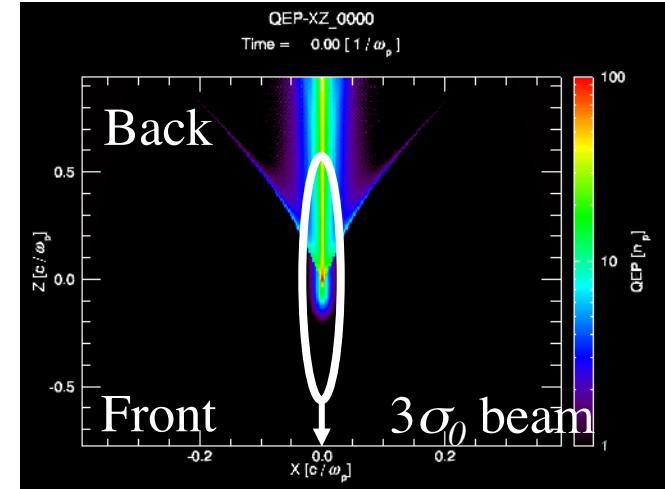

3-D QuickPIC simulations, plasma e<sup>-</sup> density:

e<sup>-</sup>:  $n_{e0} = 2 \times 10^{14} \text{ cm}^{-3}$ ,  $c/\omega_p = 375 \mu\text{m}$

e<sup>+</sup>:  $n_{e0} = 2 \times 10^{12} \text{ cm}^{-3}$ ,  $c/\omega_p = 3750 \mu\text{m}$

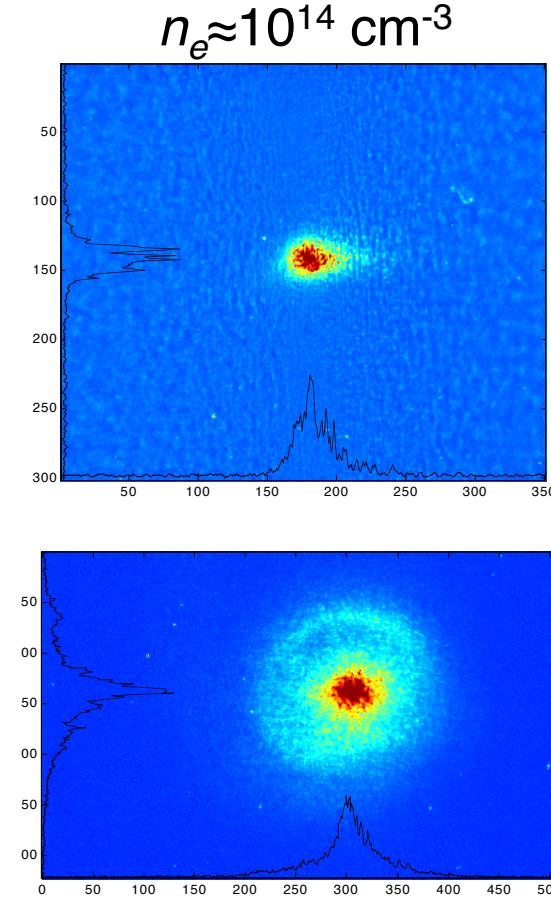

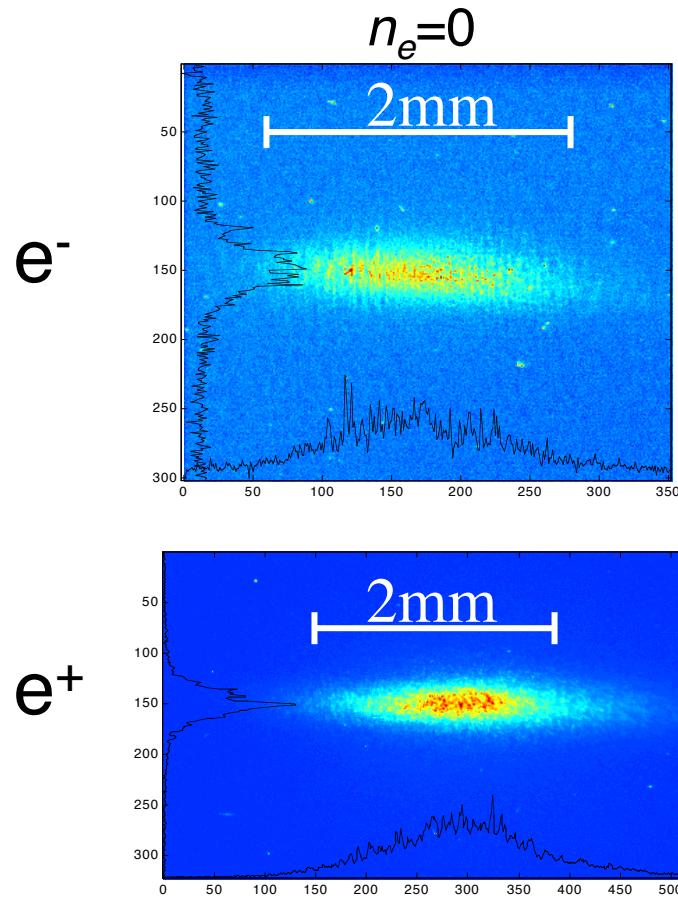

- Uniform focusing force ( $r, z$ )
- Free of geometric aberrations
- Emittance preserved

- Non-uniform focusing force ( $r, z$ )
- Emittance growth?

# FOCUSING OF $e^-/e^+$

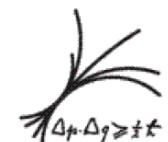

OTR images  $\approx 1\text{m}$  from plasma exit ( $\varepsilon_x \neq \varepsilon_y$ )  
 Single bunch experiments

- Ideal Plasma Lens in Blow-Out Regime

- Plasma Lens with Aberrations, Halo Formation

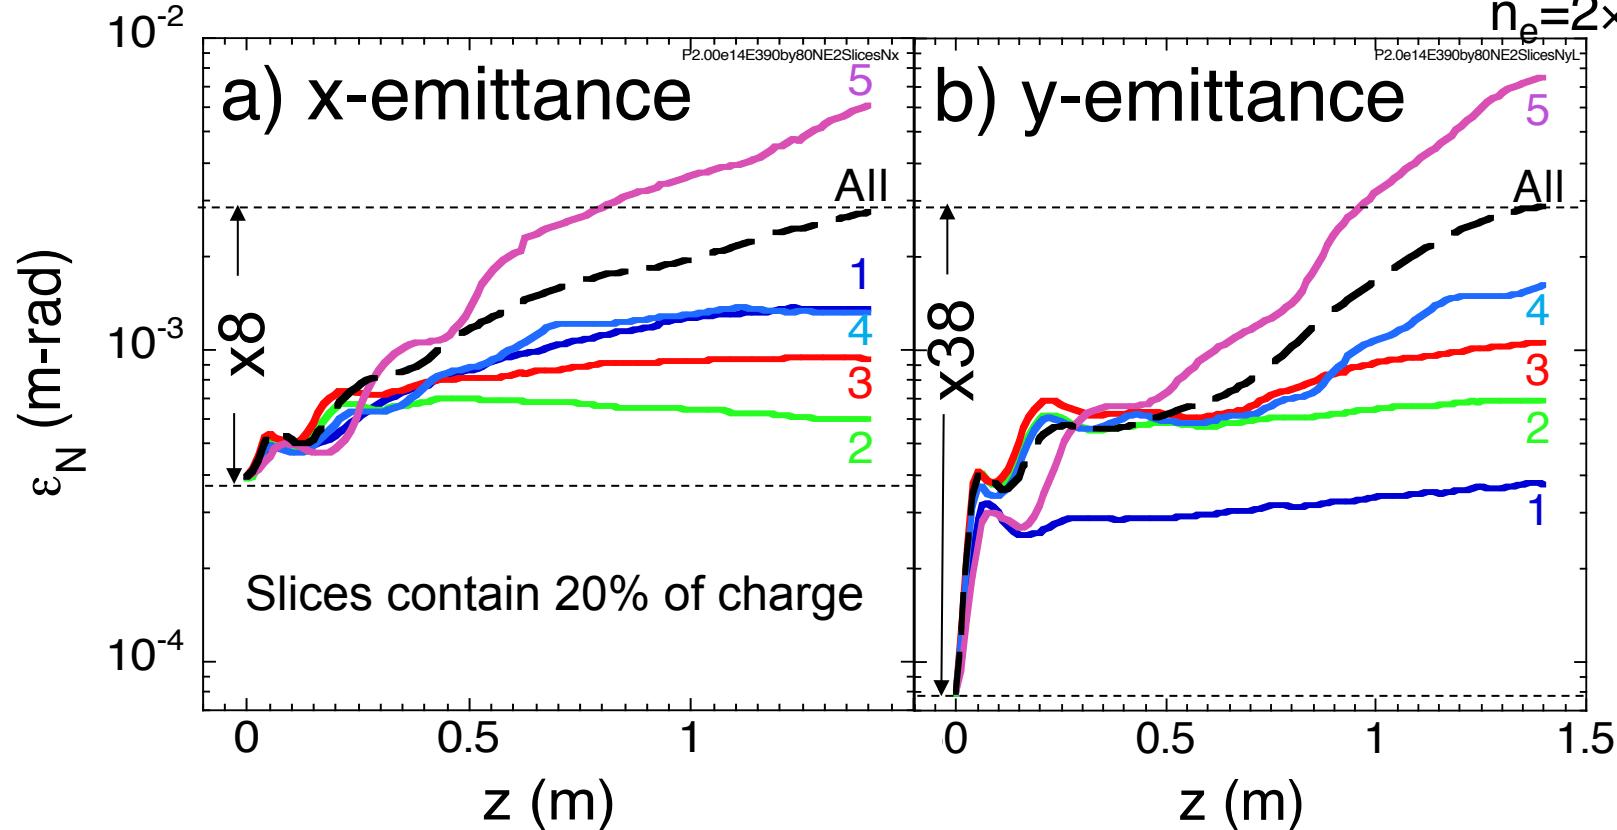

→ Focusing, but qualitative differences

# e<sup>+</sup>: SLICE EMITTANCE (SIMULATIONS)

$\sigma_{x0} \approx \sigma_{y0} \approx 25 \mu\text{m}$ ,  $\varepsilon_{Nx} \approx 390 \times 10^{-6}$ ,  $\varepsilon_{Ny} \approx 80 \times 10^{-6} \text{ m-rad}$ ,  $N = 1.9 \times 10^{10} \text{ e}^+$ ,  $L \approx 1.4 \text{ m}$

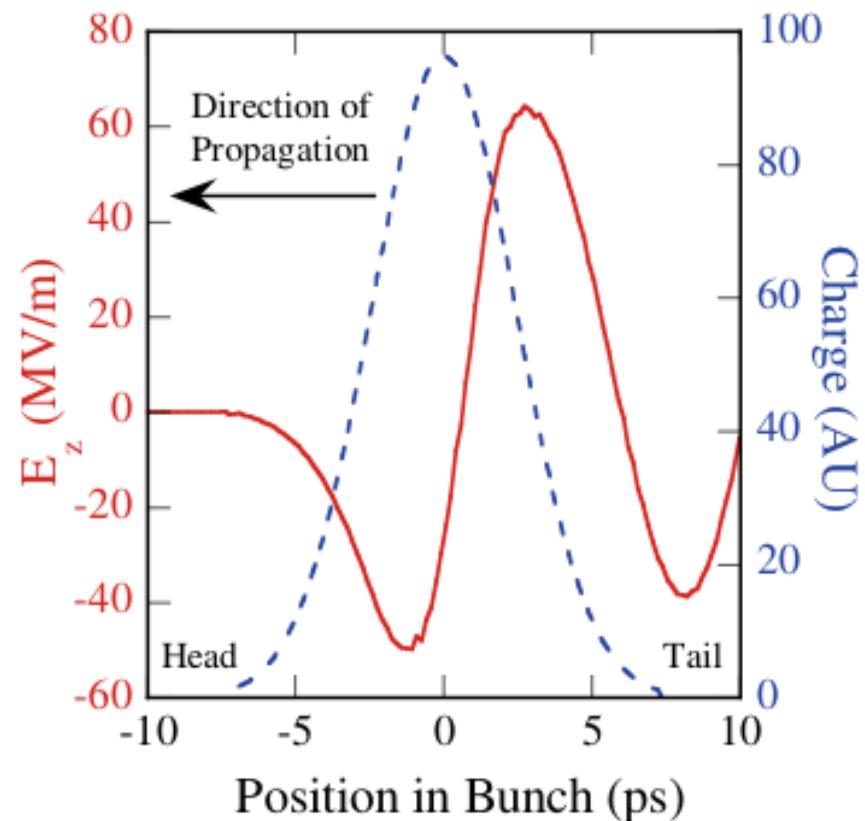

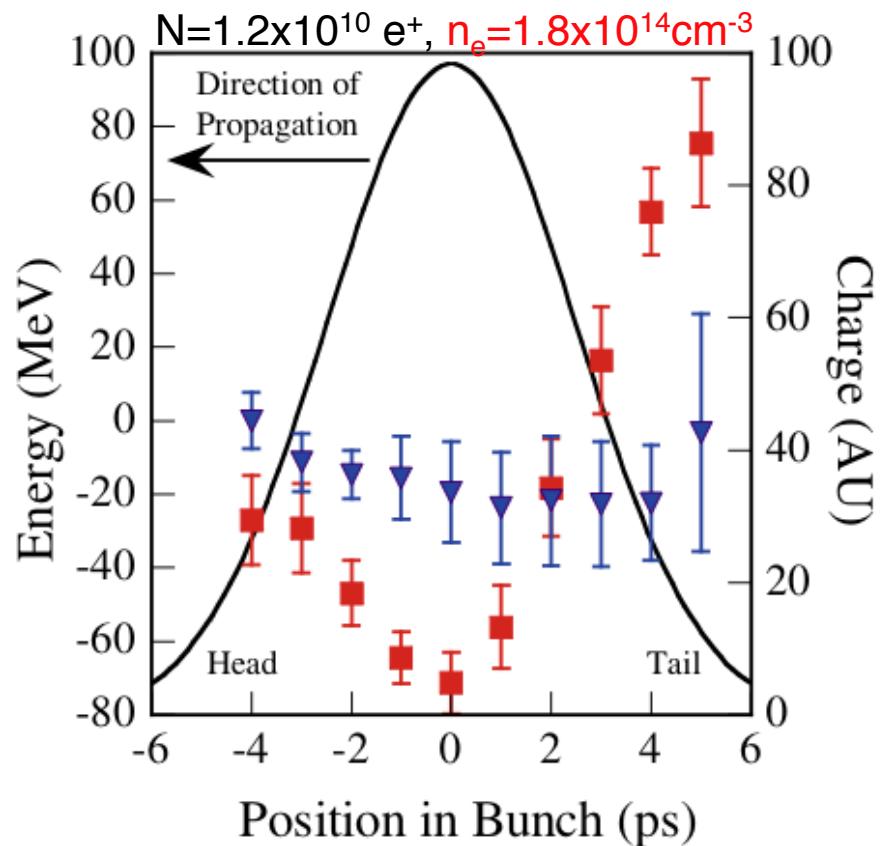

$n_e = 2 \times 10^{14} \text{ cm}^{-3}$

- ➡ Large emittance growth
- ➡ The e<sup>+</sup> beam exits the plasma with ≈equal emittances and ≈equal transverse sizes

# e<sup>+</sup> ACCELERATION PRE-IONIZED, LONG BUNCH

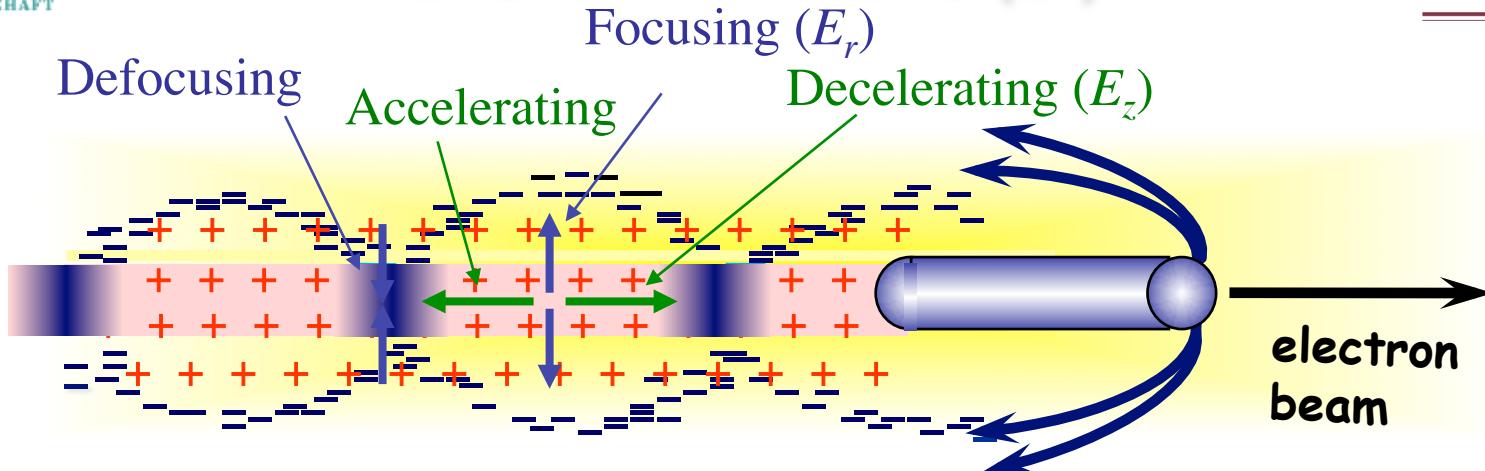

Blue, Phys. Rev. Lett. 90, 214801 (2003).

- ➡ Energy gain and loss  $\approx 80$  MeV over 1.4 m
- ➡ Good agreement with numerical simulations

## PLASMA NUMBERS ( $e^-$ )

→ Linear theory scaling:

$$E_{acc} \approx 110(MV/m) \frac{N/2 \times 10^{10}}{(\sigma_z / 0.6mm)^2}$$

$$\approx N/\sigma_z^2$$

@  $k_{pe}\sigma_z \approx \sqrt{2}$  (with  $k_{pe}\sigma_z \ll 1$ )

→ Focusing strength:  $\frac{B_\theta}{r} = \frac{1}{2} \frac{n_e e}{\epsilon_0 c} = 3kT/m \times n_e (10^{14} cm^{-3})$

Short !  
Bunches !

→  $N=2 \times 10^{10}$ :  $\sigma_z = 600 \mu m$ ,  $n_e = 2 \times 10^{14} cm^{-3}$ ,  $E_{acc} \approx 100 MV/m$ ,  $B_\theta/r = 6 kT/m$   
 $\sigma_z = 20 \mu m$ ,  $n_e = 2 \times 10^{17} cm^{-3}$ ,  $E_{acc} \approx 10 GV/m$ ,  $B_\theta/r = 6 MT/m$

+plasma  
field ionization!

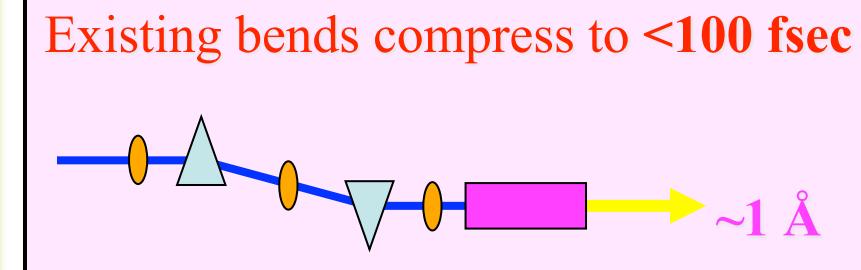

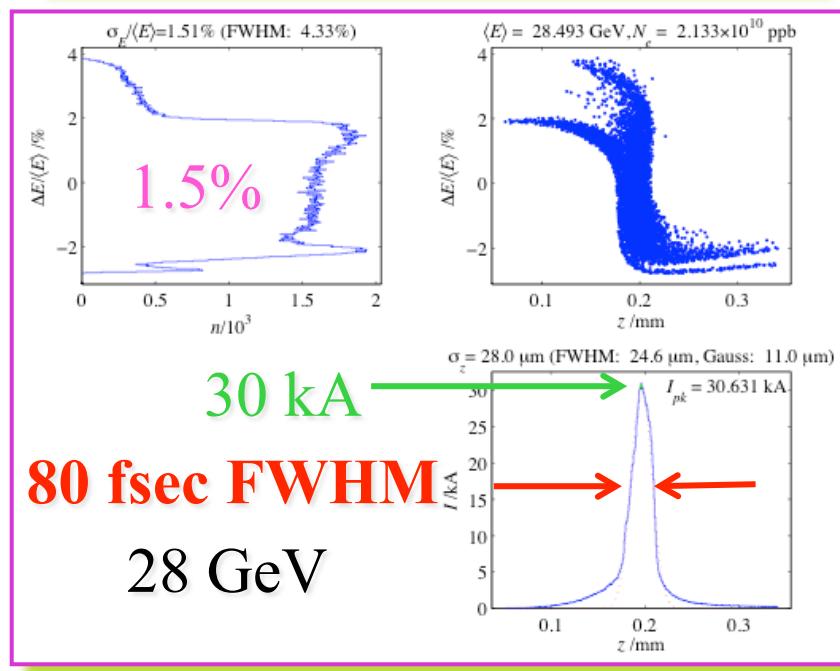

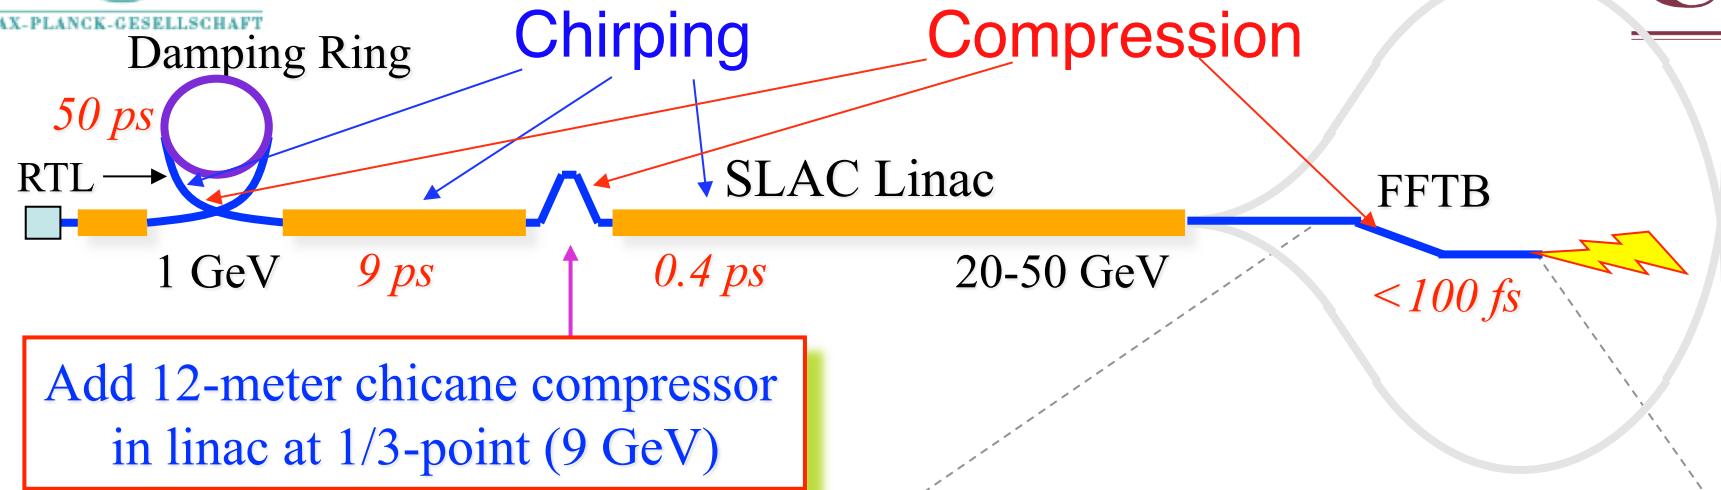

→ Conventional:  $E_{acc} < 150 MV/m$ ,  $B_\theta/r < 2 kT/m$

# Short Bunch Generation In The SLAC Linac

USC

- Bunch magnetic compression ( $N=cst$ ) by a factor of  $\approx 730/25 \approx 29$ !

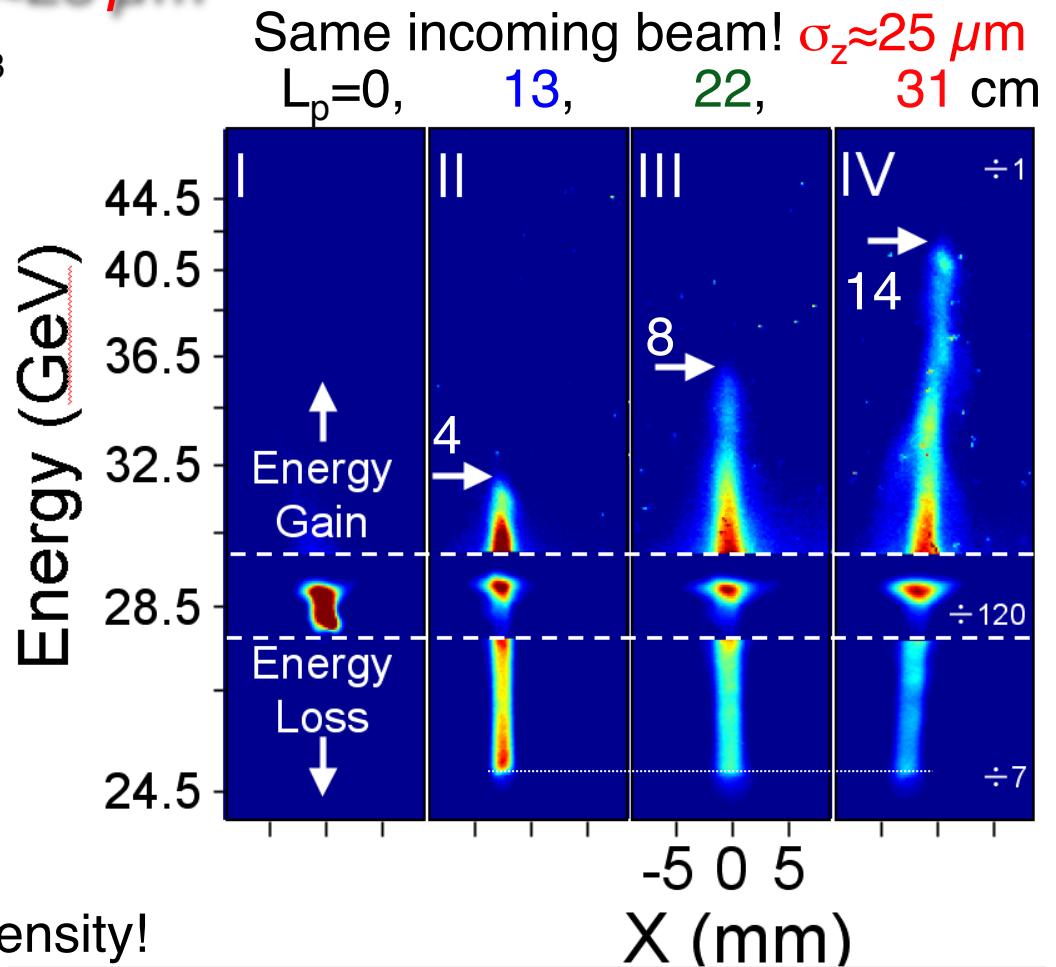

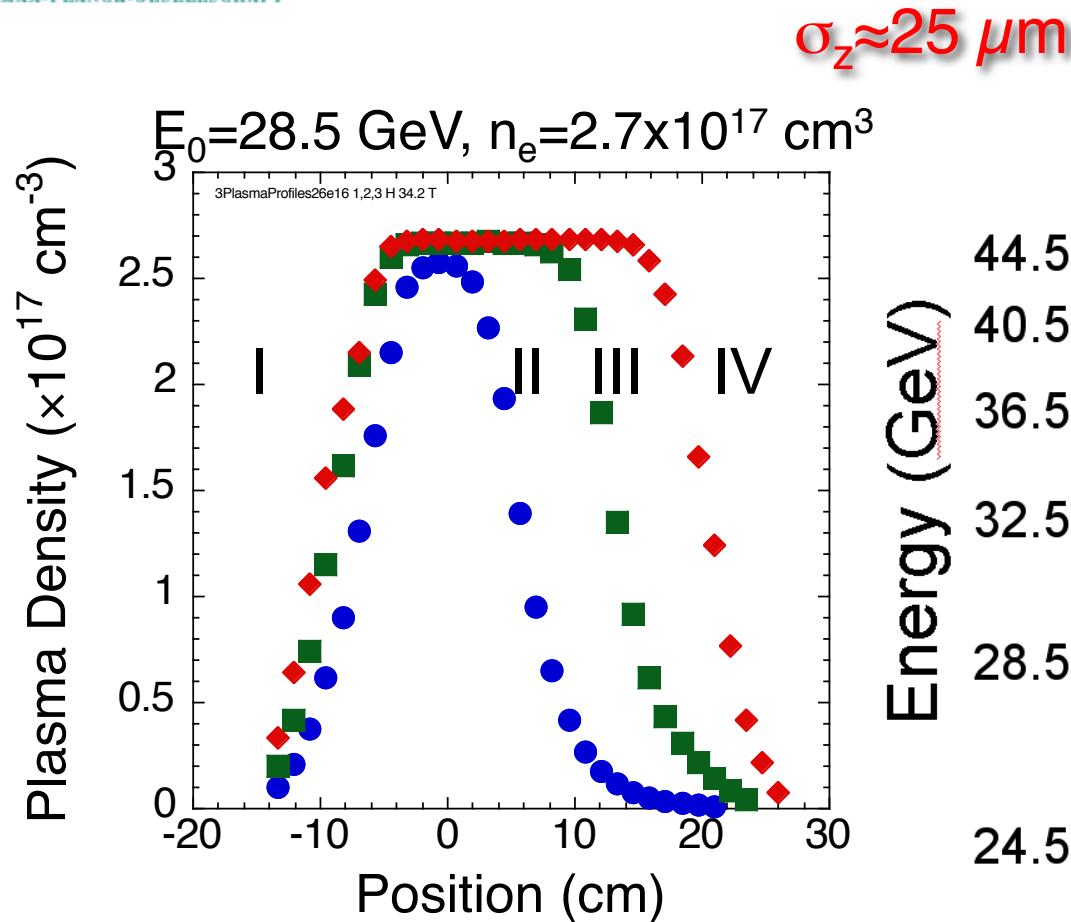

$$E_{acc} \cong 110(MV/m) \frac{N/2 \times 10^{10}}{(\sigma_z/0.6mm)^2}$$

- $E_{r, \text{bunch}} > 6\text{GV/m}$ , filed-ionize Li!

Courtesy of SPPS

# SCALING WITH PLASMA LENGTH

- Energy gain scales with plasma density!
- Gain  $\approx 14 \text{ GeV}$  over (only!)  $L_p = 31 \text{ cm}$ !
- $E_{\text{acc}} \approx 45 \text{ GV/m}$

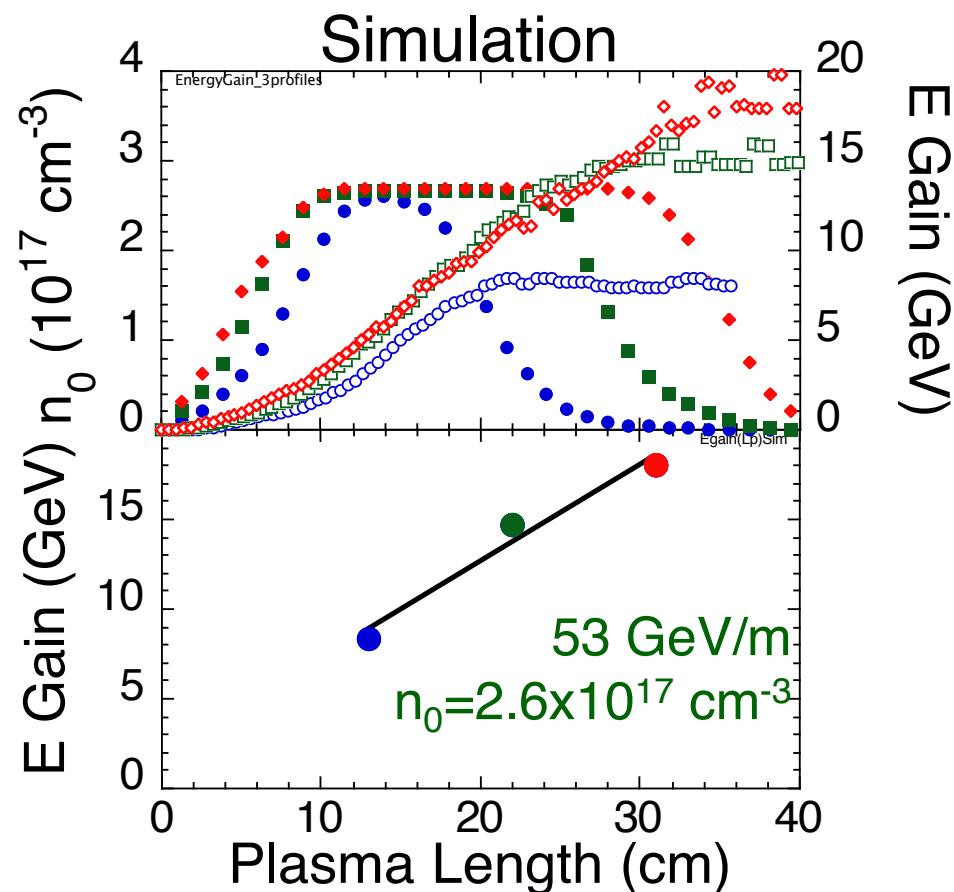

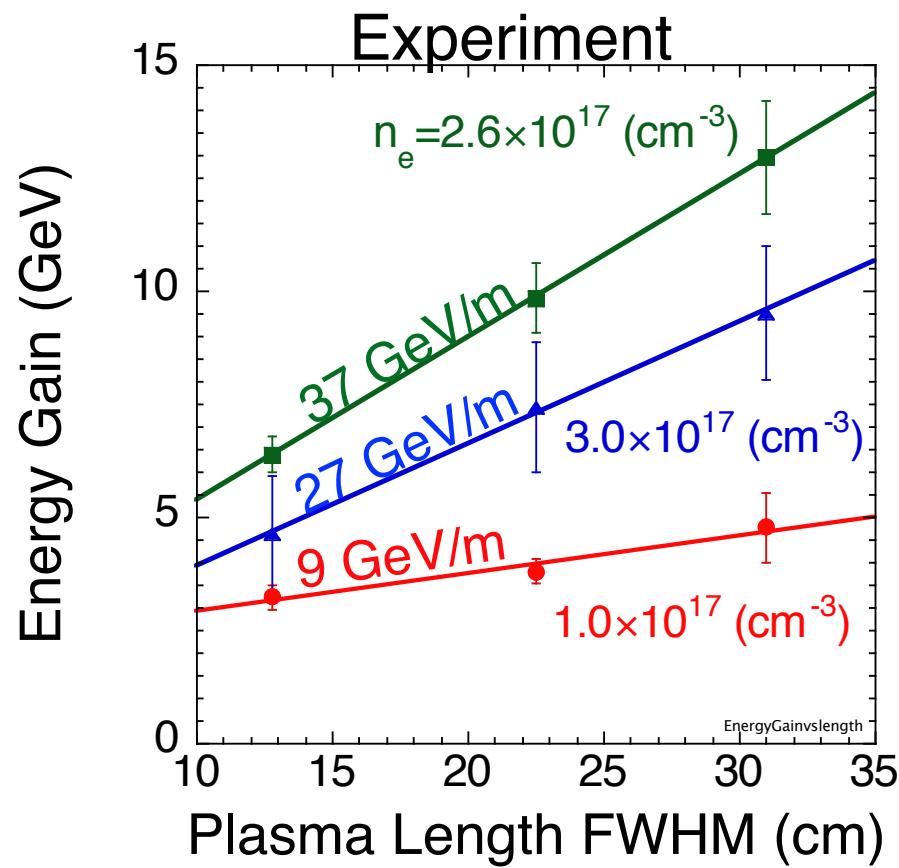

# SCALING WITH PLASMA LENGTH

$$\text{Accelerating Gradient} = \frac{\text{Energy Gain}}{\text{Plasma Length}}$$

$$E_0=28.5 \text{ GeV}$$

$$\sigma_z \approx 25 \mu\text{m}$$

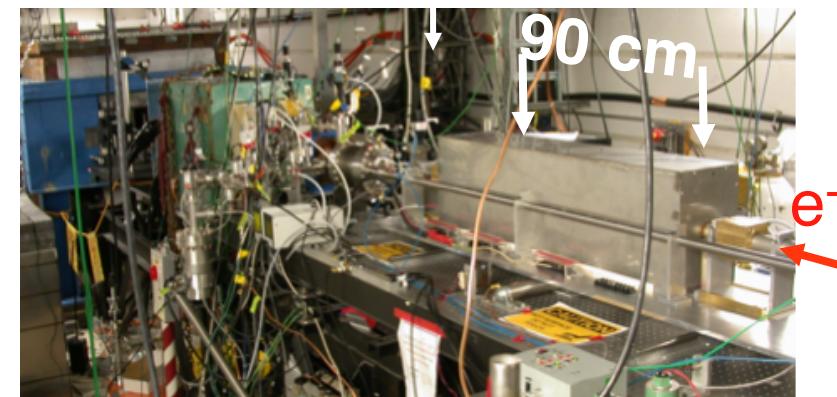

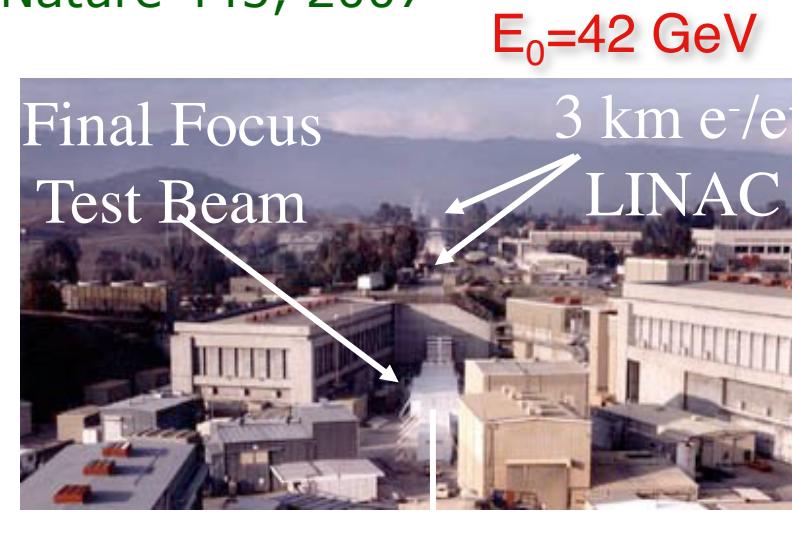

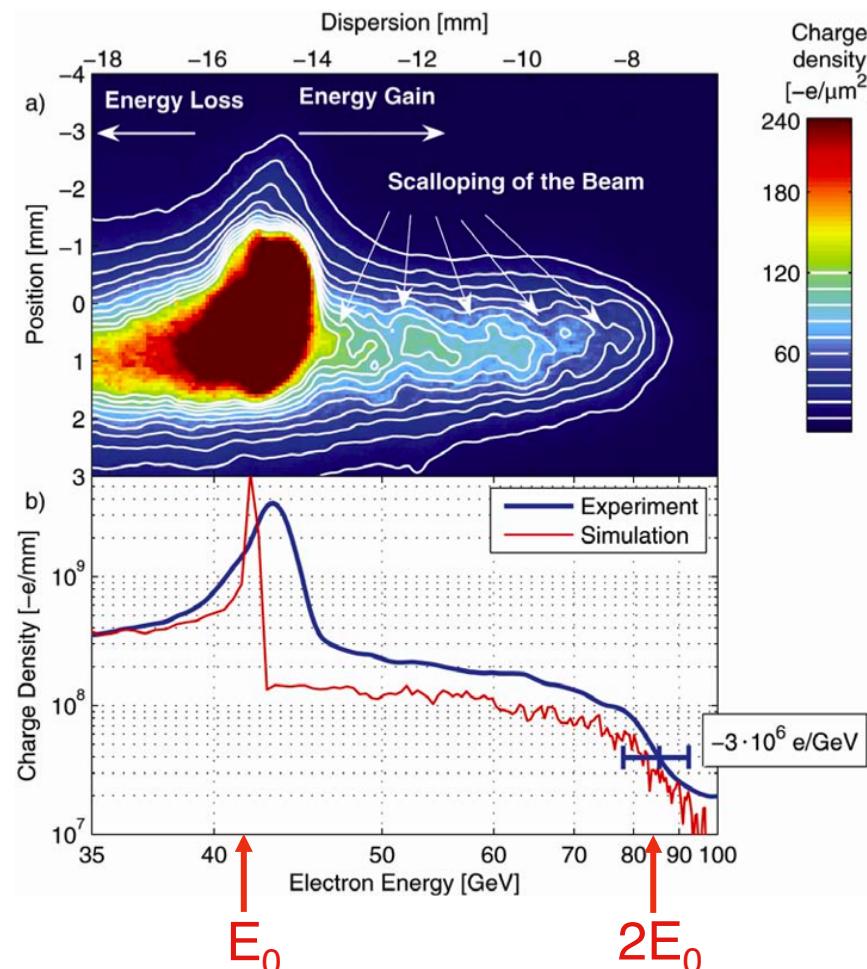

- Energy gain scales linearly with  $L_p$ , optimum  $n_e \approx 2.6 \times 10^{17} \text{ cm}^{-3}$
- Experimental accelerating gradient:  $E_{\text{acc}} \approx 37 \text{ GeV/m}$  (max. avg.)

# e<sup>-</sup> ENERGY DOUBLING

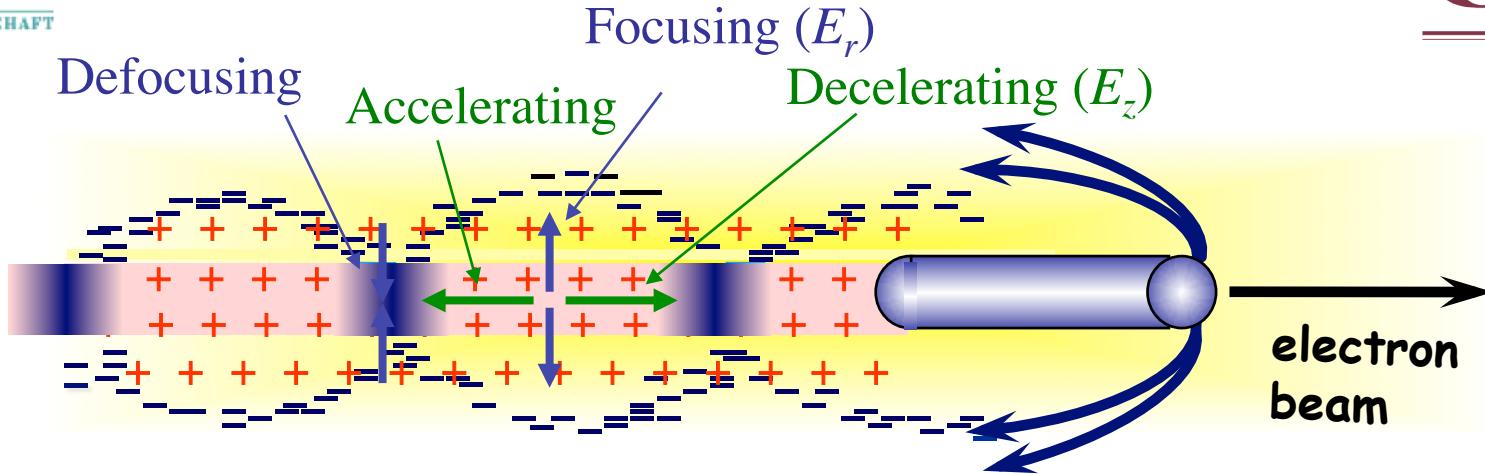

I. Blumenfeld *et al.*, Nature 445, 2007

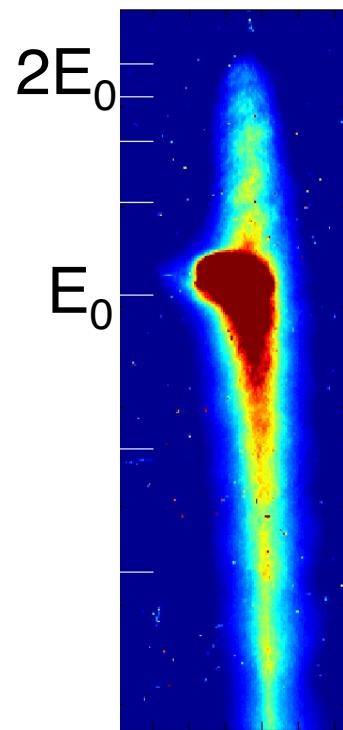

- Energy doubling of e<sup>-</sup> over  $L_p \approx 85 \text{ cm}$ ,  $2.7 \times 10^{17} \text{ cm}^{-3}$  plasma
- Unloaded gradient  $\approx 52 \text{ GV/m}$  ( $\approx 150 \text{ pC accel.}$ )

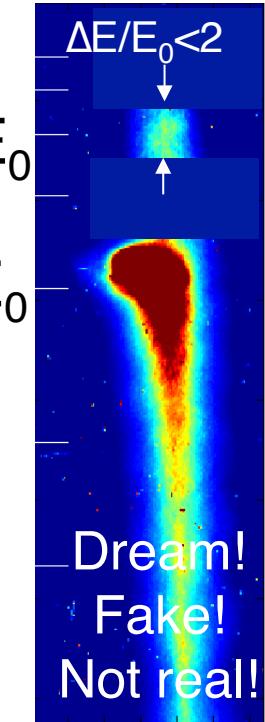

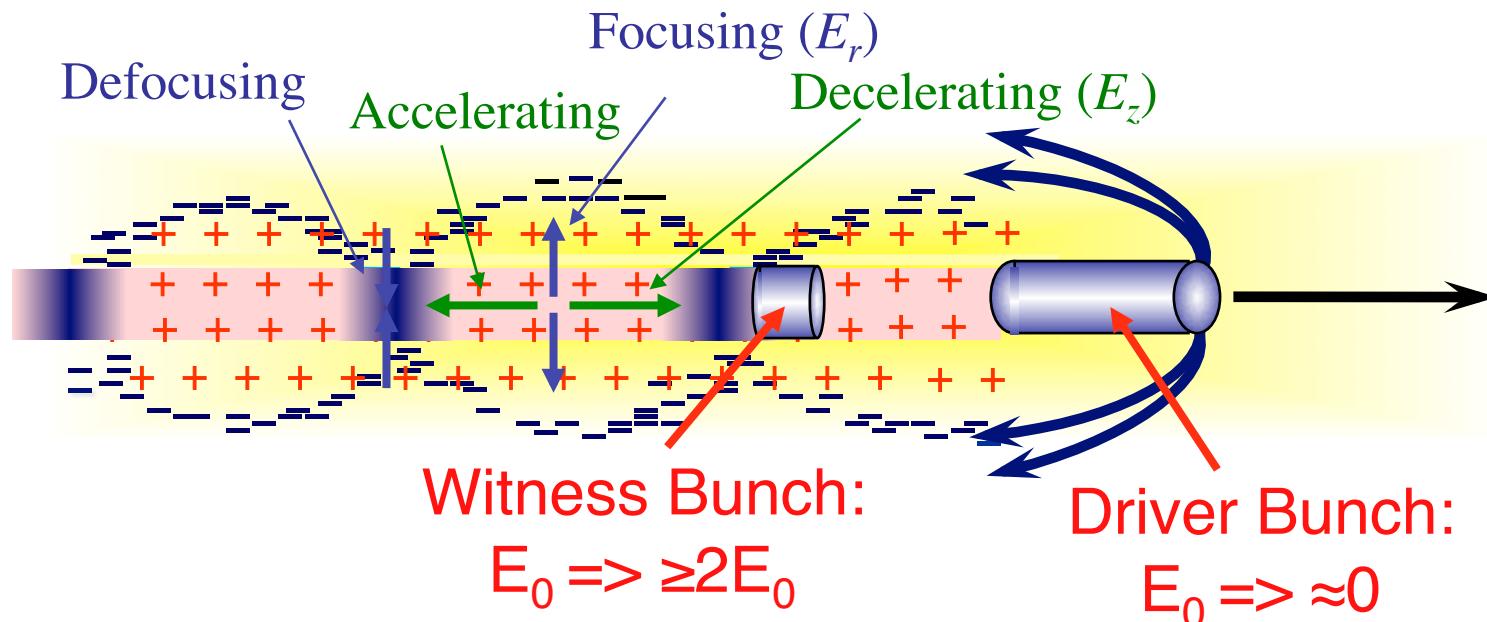

# SINGLE BUNCH PWFA

- ➡ Large energy gain (42GeV) in only 85cm, but ...
- ➡ Particles at all phase, large energy spread (100%)
- ➡ Particle acceleration, not bunch acceleration
- ➡ Need witness bunch injection behind a drive bunch

# 2-BUNCH PWFA

- Really important experiment! (psychologically)
- Driver bunch: high-charge ( $3N$ ), modest emittance, shaped?
- Witness bunch: lower charge ( $N$ ), good emittance, shorter beam loading for  $\Delta E/E \ll 1$
- New facility: FACET@SLAC for 23GeV PWFA accelerator module
- Low energy physics experiments

Hogan et al., *New J. Phys.* 12, 055030 (2010)

# MULTIBUNCH PWFA

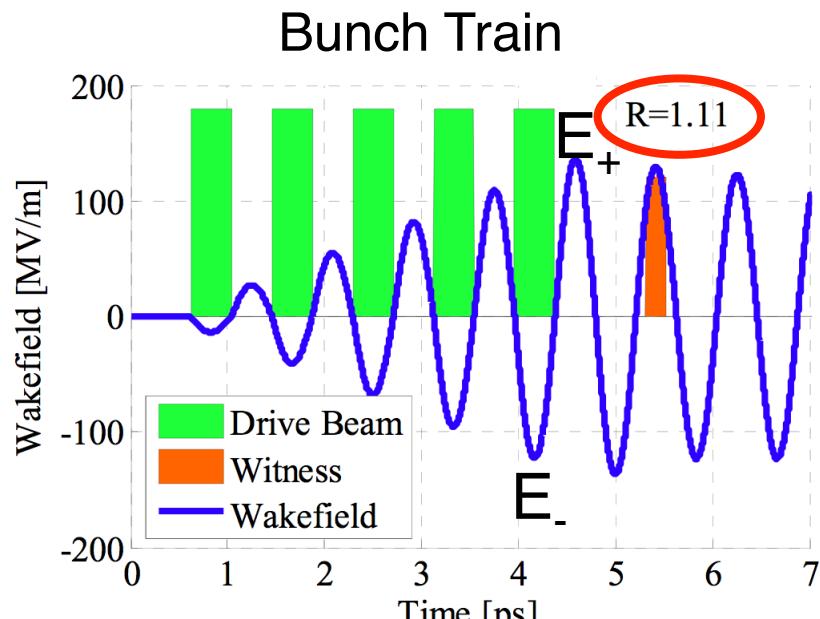

Transformer Ratio:  $R = E_+ / E_-$

Energy Gain:  $\leq RE_0$

$\sigma_r=125 \mu\text{m}$ ,  $n_e=1.8 \times 10^{16} \text{ cm}^{-3}$ ,  $\lambda_p=250 \mu\text{m}$

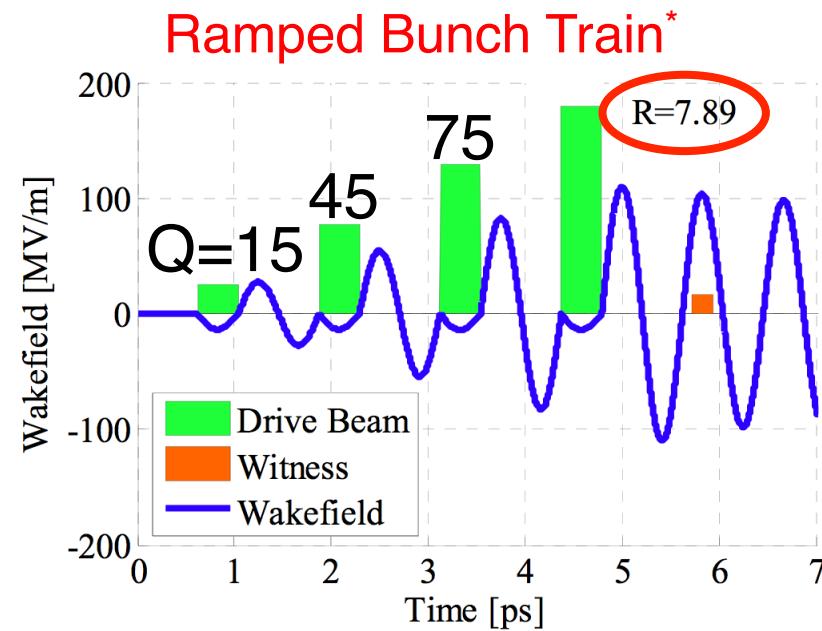

$E_0$ : incoming energy

$Q=30 \text{ pC/bunch}$ ,  $\Delta z=250 \mu\text{m} \approx \lambda_p$

Kallos, PAC'07 Proceedings

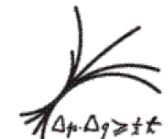

$\Delta z=375 \mu\text{m} \approx 1.5\lambda_p$

\*Tsakanov, NIMA, 1999

→ Linear (2D) theory for  $n_b \ll n_e$ !

→  $R=7.9 \Rightarrow$  multiply energy by ~8 in a single PWFA stage!

# MULTIBUNCH PWFA

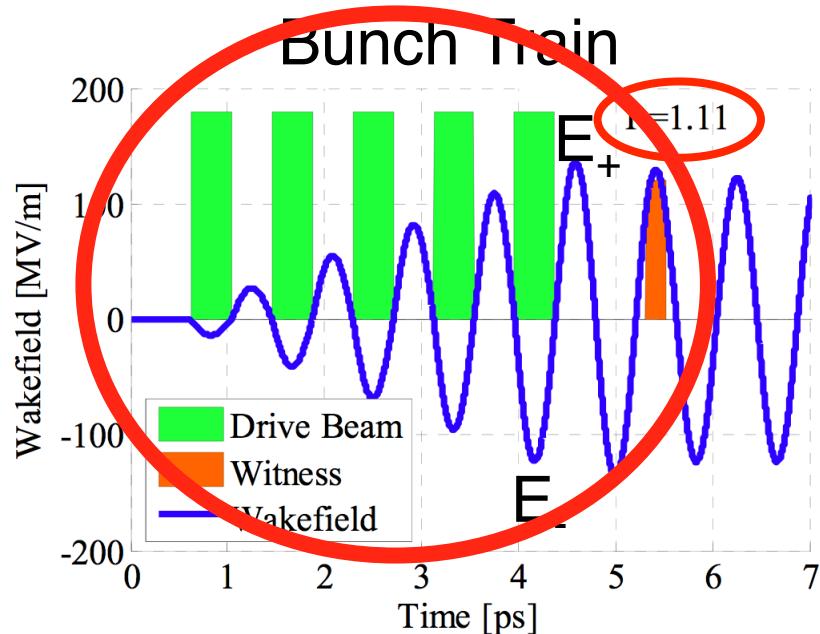

Transformer Ratio:  $R = E_+ / E_-$

Energy Gain:  $\leq RE_0$

$\sigma_r=125 \mu\text{m}$ ,  $n_e=1.8 \times 10^{16} \text{ cm}^{-3}$ ,  $\lambda_p=250 \mu\text{m}$

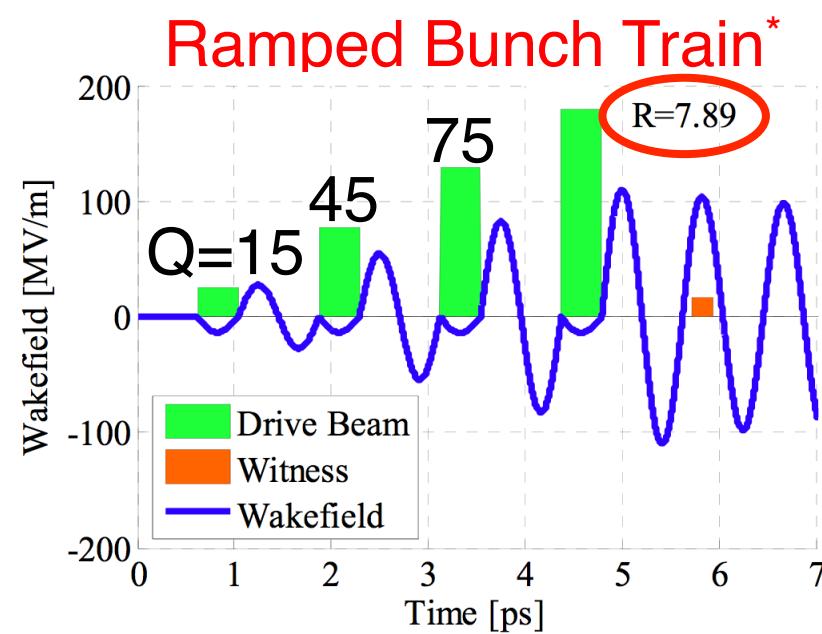

$E_0$ : incoming energy

$Q=30 \text{ pC/bunch}$ ,  $\Delta z=250 \mu\text{m} \approx \lambda_p$

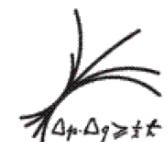

Kallos, PAC'07 Proceedings

$\Delta z=375 \mu\text{m} \approx 1.5\lambda_p$

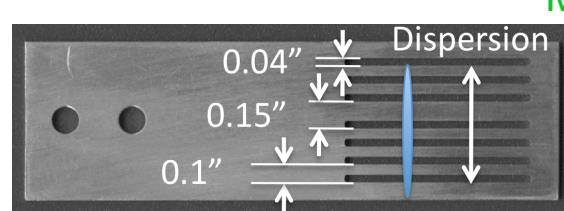

\*Tsakanov, NIMA, 1999

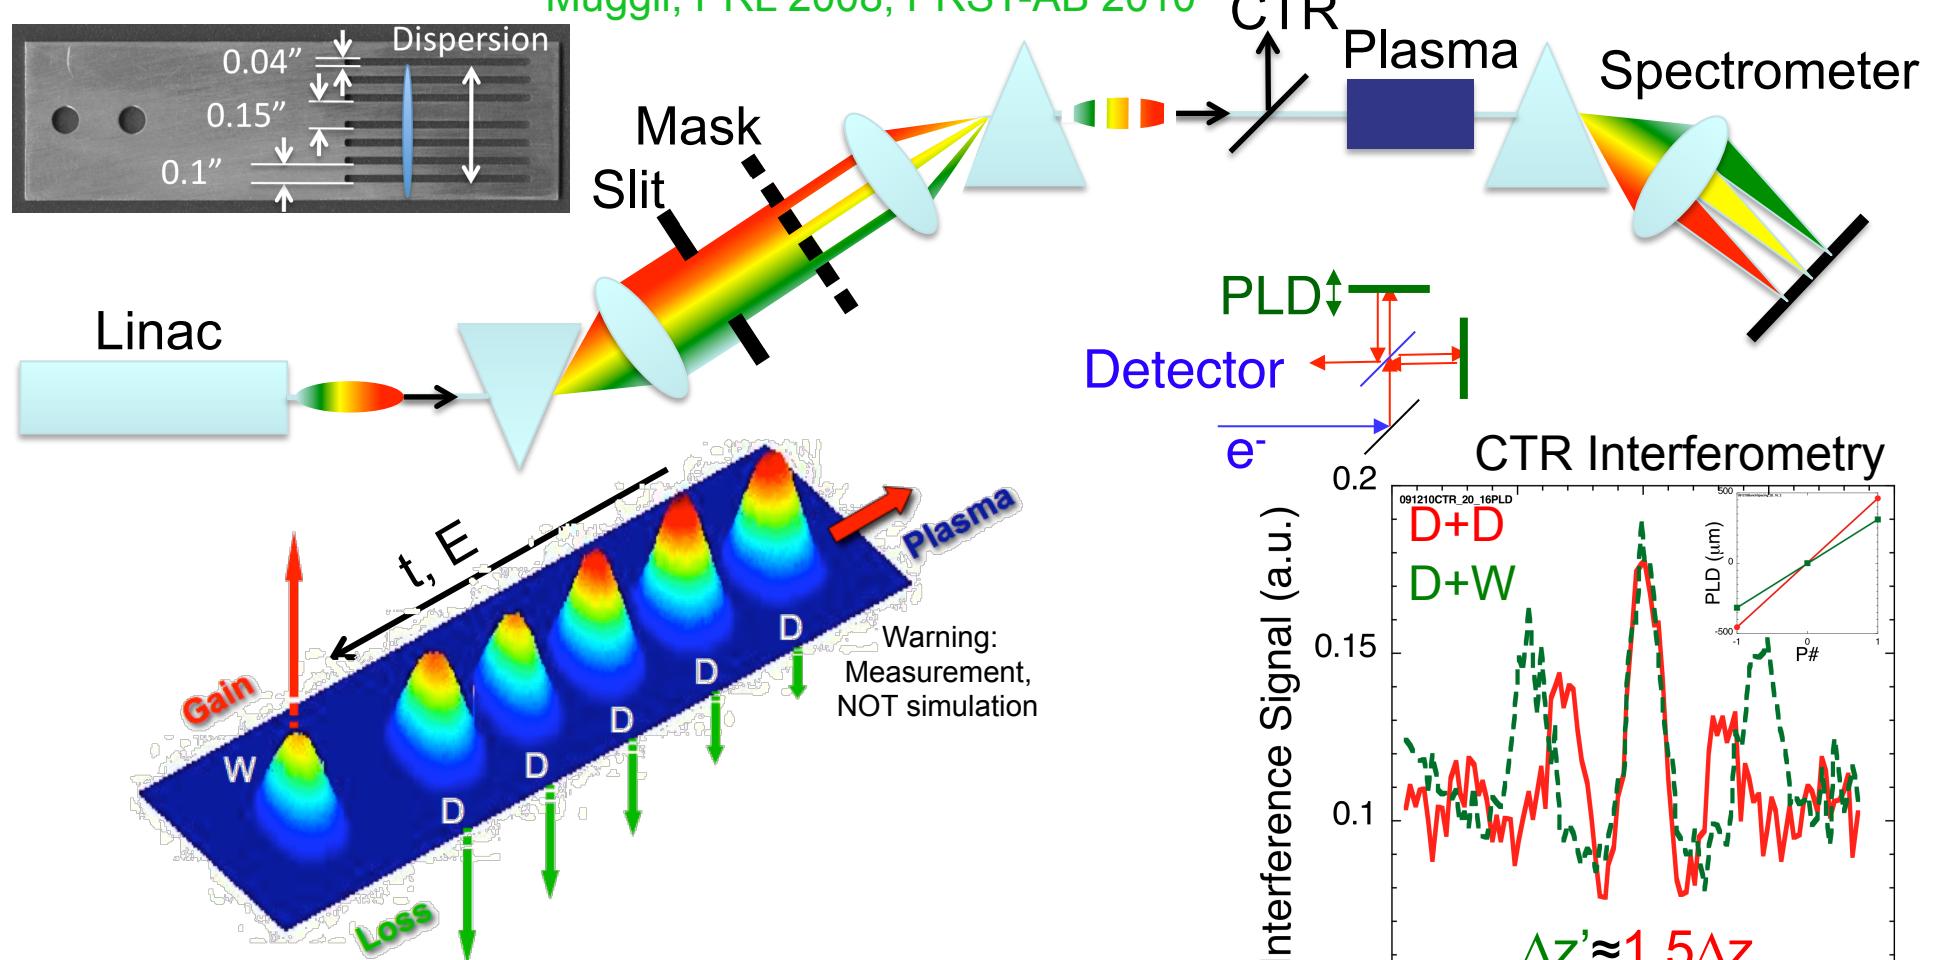

- Resonant excitation of wakefields
- Large transformer ratio and energy gain (>2)

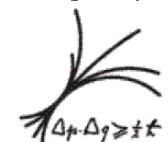

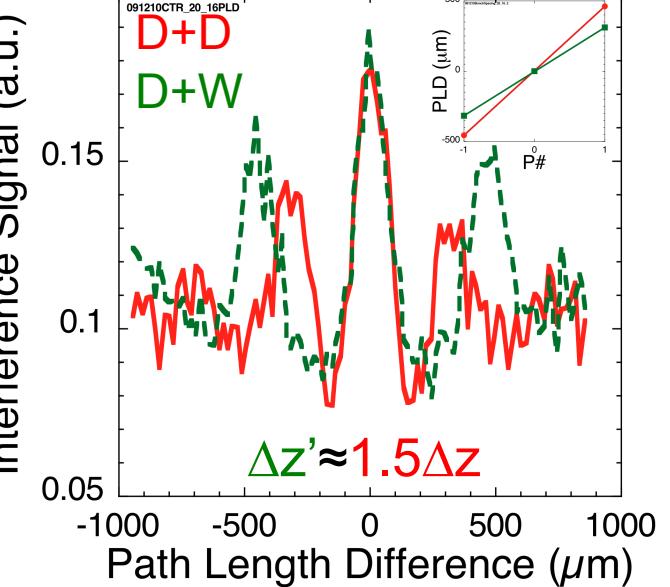

# MULTIBUNCH SOURCE-MASKING

Muggli, PRL 2008, PRST-AB 2010

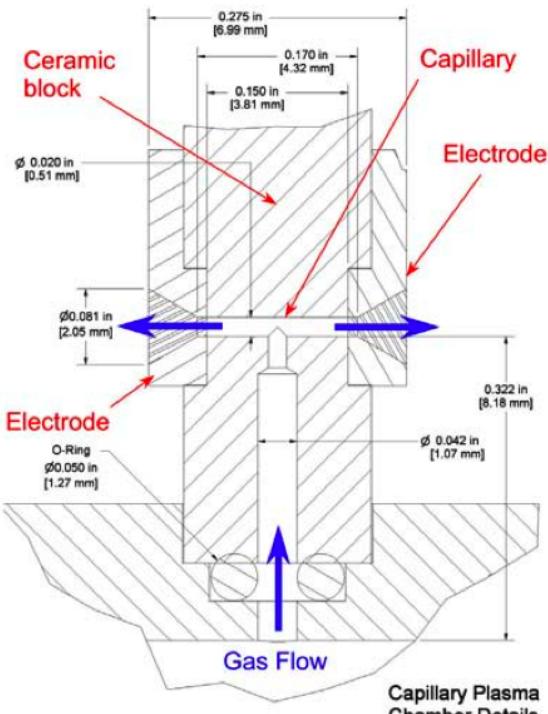

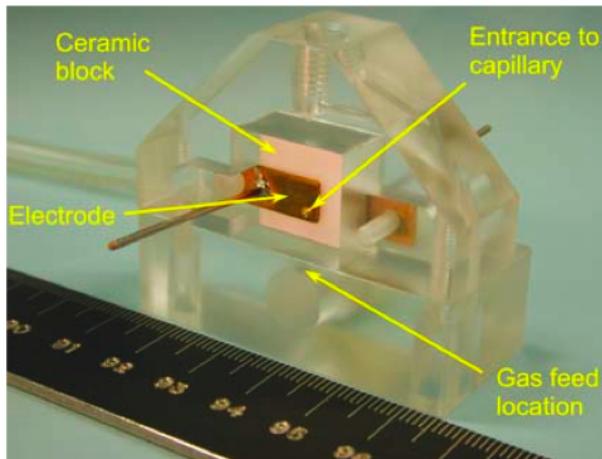

- Emittance selection
- Can choose the chirp, W at high energy
- Choose microbunches spacing and widths with mask and beam parameters: N,  $\Delta z$ ,  $\sigma_z$ , Q

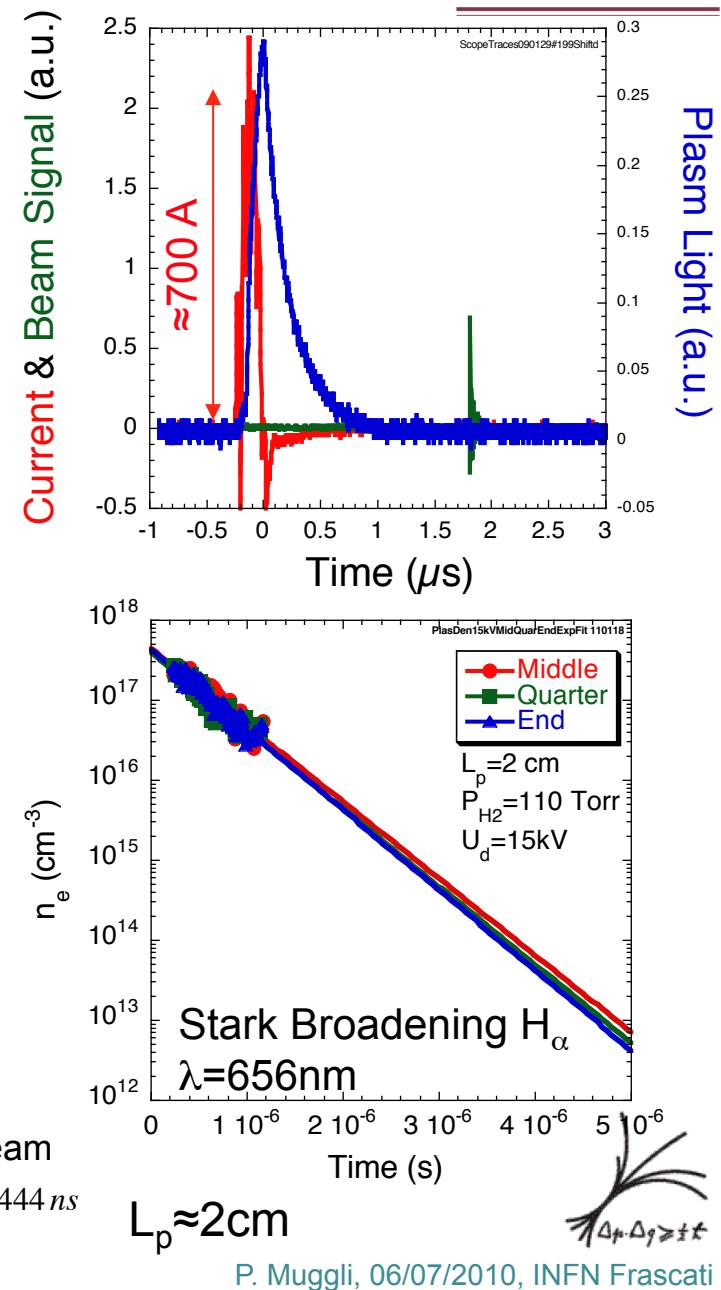

# PLASMA SOURCE

## H<sub>2</sub>-puff Capillary Discharge

Kimura, AAC'06 Proceedings

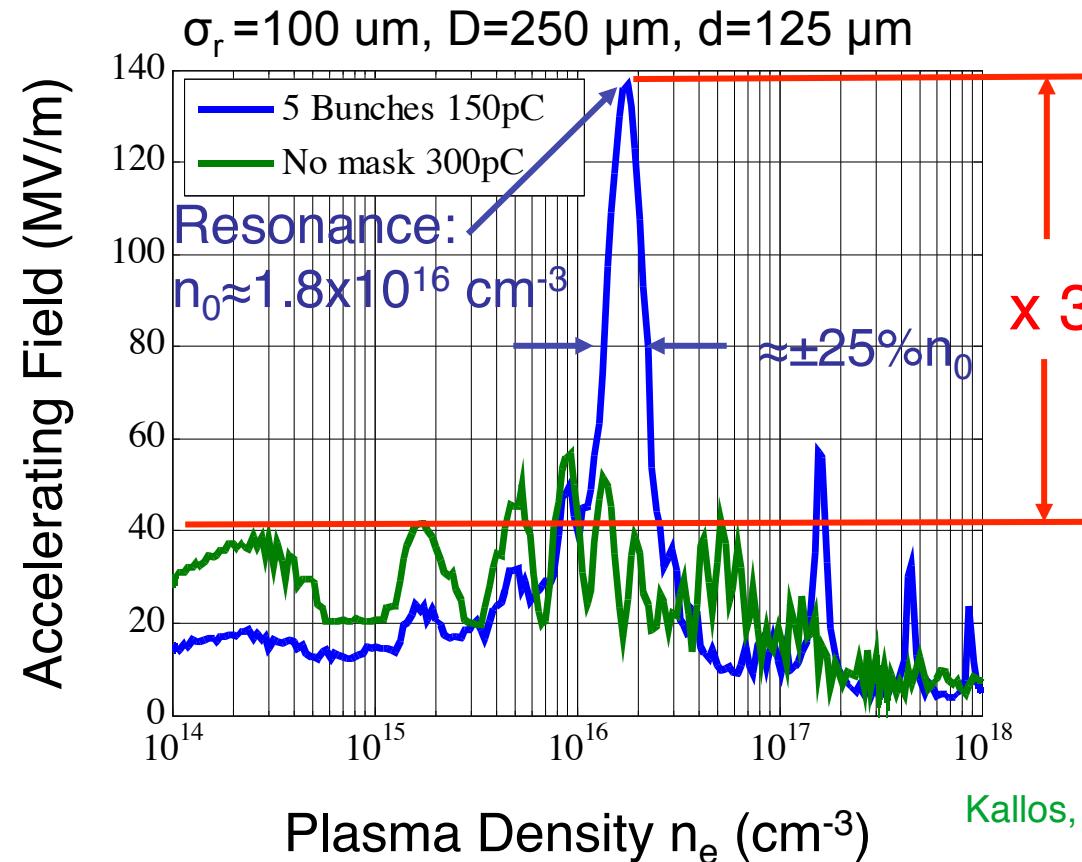

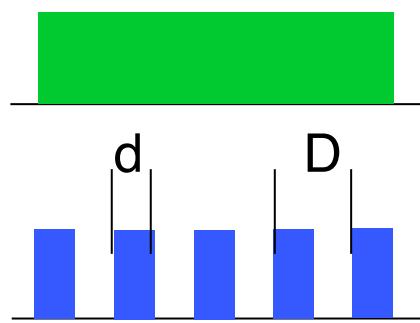

- U=15kV, P<sub>H<sub>2</sub></sub>=100Torr
- Plasma density n<sub>e</sub> controlled through τ<sub>discharge-beam</sub>
- n<sub>e</sub> fit and extrapolation  $n_e(\tau) \approx 4.3 \times 10^{17} \text{ cm}^{-3} e^{-\tau/444 \text{ ns}}$

# ACCELERATING FIELD

Linear calculation microbunches with equal charge

- Expect  $\approx$ MeV energy gain/loss over 1 cm
- Microbunch resonance clear, and narrow

# ENERGY CHANGE

Linear calculation (2D): microbunches with equal charge

Experimental  
Parameters:

$$E_0 = 59 \text{ MeV}$$

$$\sigma_r = 100 \text{ } \mu\text{m},$$

$$\Delta z = 284 \text{ } \mu\text{m},$$

$$d = 142 \text{ } \mu\text{m}$$

$$\Delta z' = 426 \text{ } \mu\text{m}$$

$$Q_{\text{tot}} = 140 \text{ pC}$$

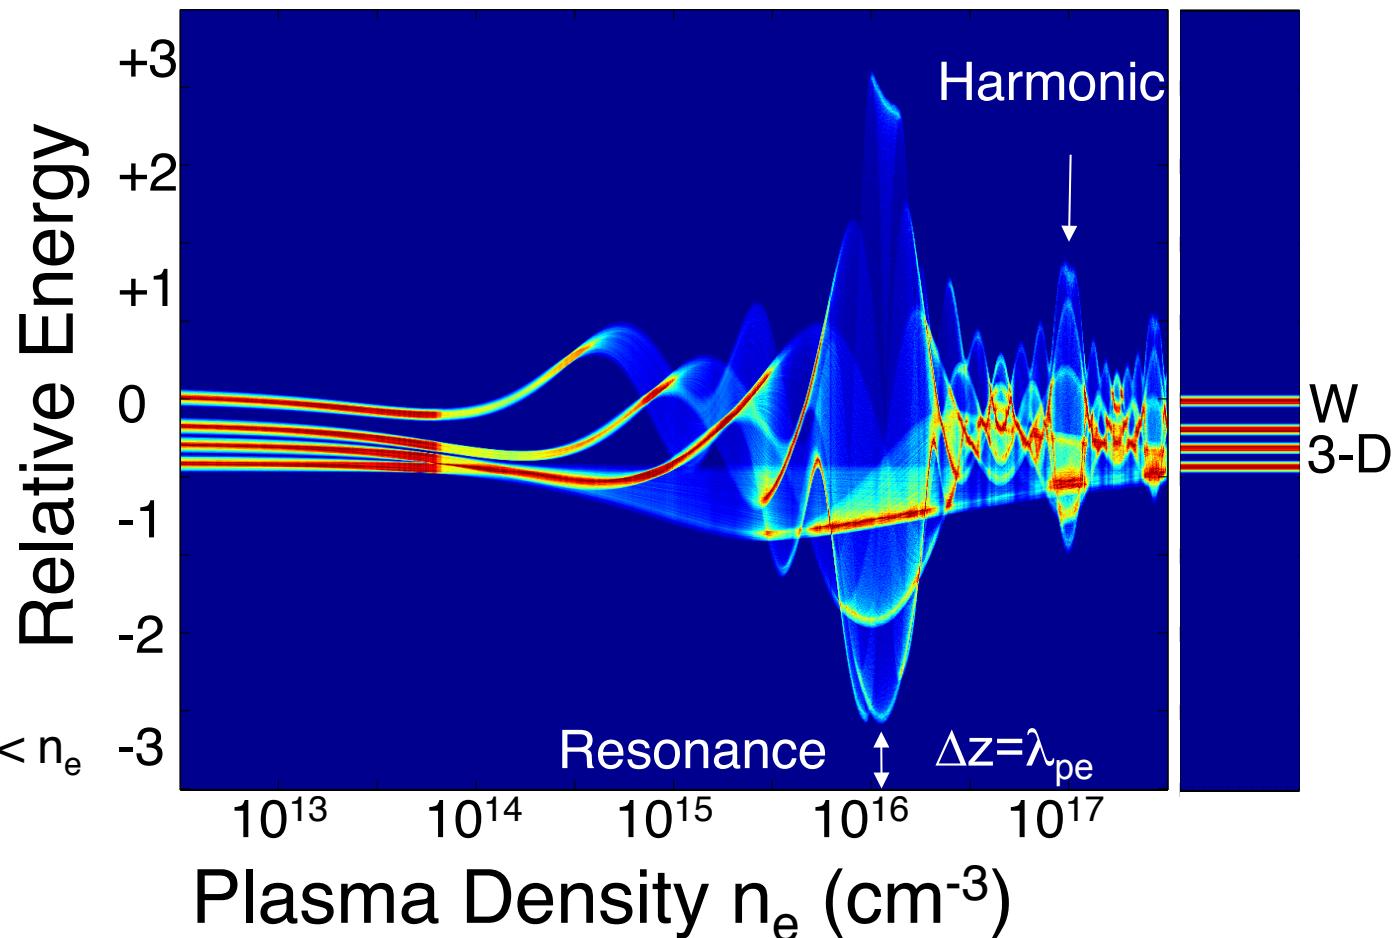

$$N_d = 3D + W$$

$$Q_b = 35 \text{ pC}$$

$$L_p = 2 \text{ cm}$$

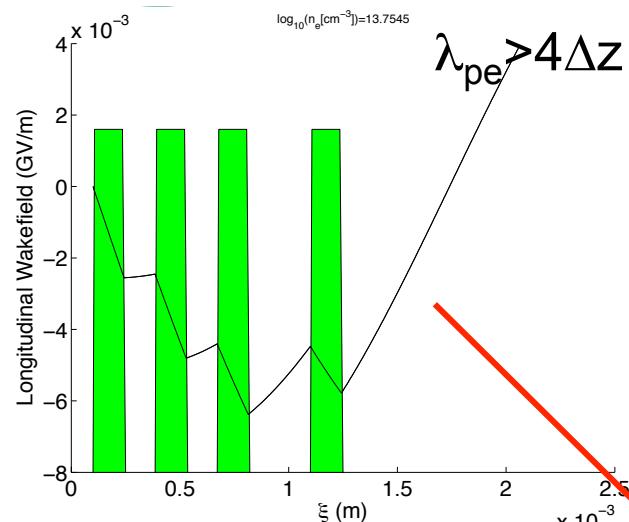

$$n_b \approx 4 \times 10^{13} \text{ cm}^{-3} \ll n_e$$

Linear Regime!

- Resonant excitation of wakefield is the main feature
- Chirp such that W enters with highest energy
- $n_{e, \text{res}} \approx 1.4 \times 10^{16} \text{ cm}^{-3}$

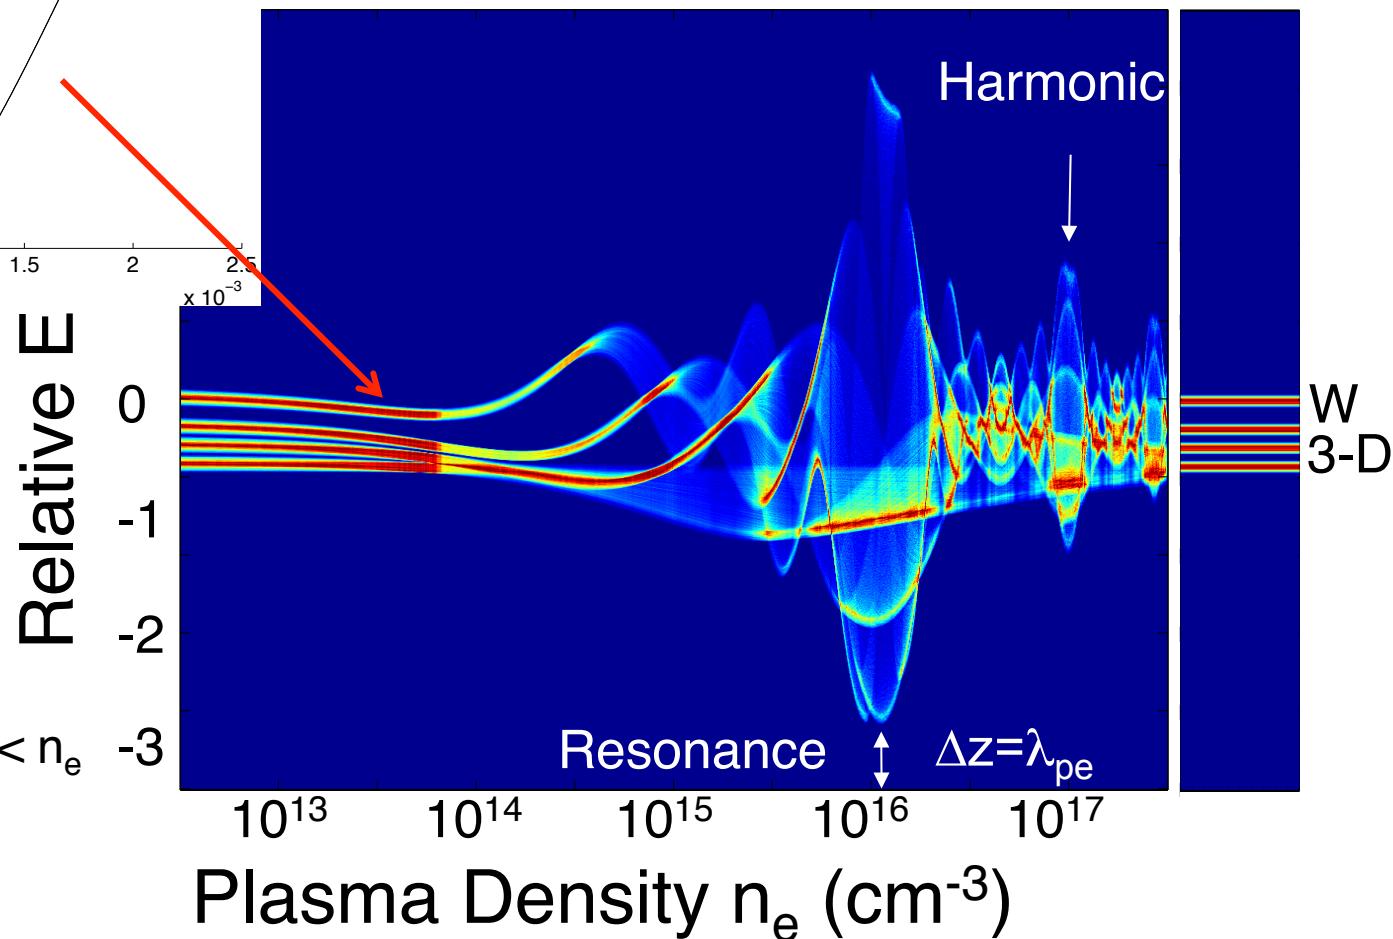

$\Delta z = 284 \mu\text{m}$ ,  
 $d = 142 \mu\text{m}$   
 $\Delta z' = 426 \mu\text{m}$   
 $Q_{\text{tot}} = 140 \text{ pC}$   
 $N_d = 3\text{D} + W$   
 $Q_b = 35 \text{ pC}$   
 $L_p = 2 \text{ cm}$   
 $n_b \approx 4 \times 10^{13} \text{ cm}^{-3} \ll n_e$

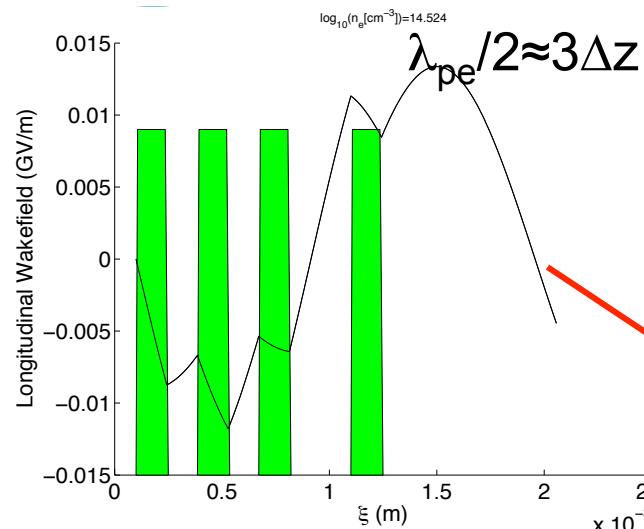

Linear Regime!

**ENERGY CHANGE**  
 culation (2D): microbunches with equal charge

- Energy gain,  $0.74 \text{ MeV}$  or  $\sim 37 \text{ MeV/m}$

$$\frac{3D+W}{-3D} = \frac{W}{W}$$

- Resonance clearly observed
- Large energy loss,  $\sim 1.95 \text{ MeV}$  or  $\sim 97 \text{ MeV/m}$  (over 2cm)
- Energy gain,  $0.74 \text{ MeV}$  or  $\sim 37 \text{ MeV/m}$

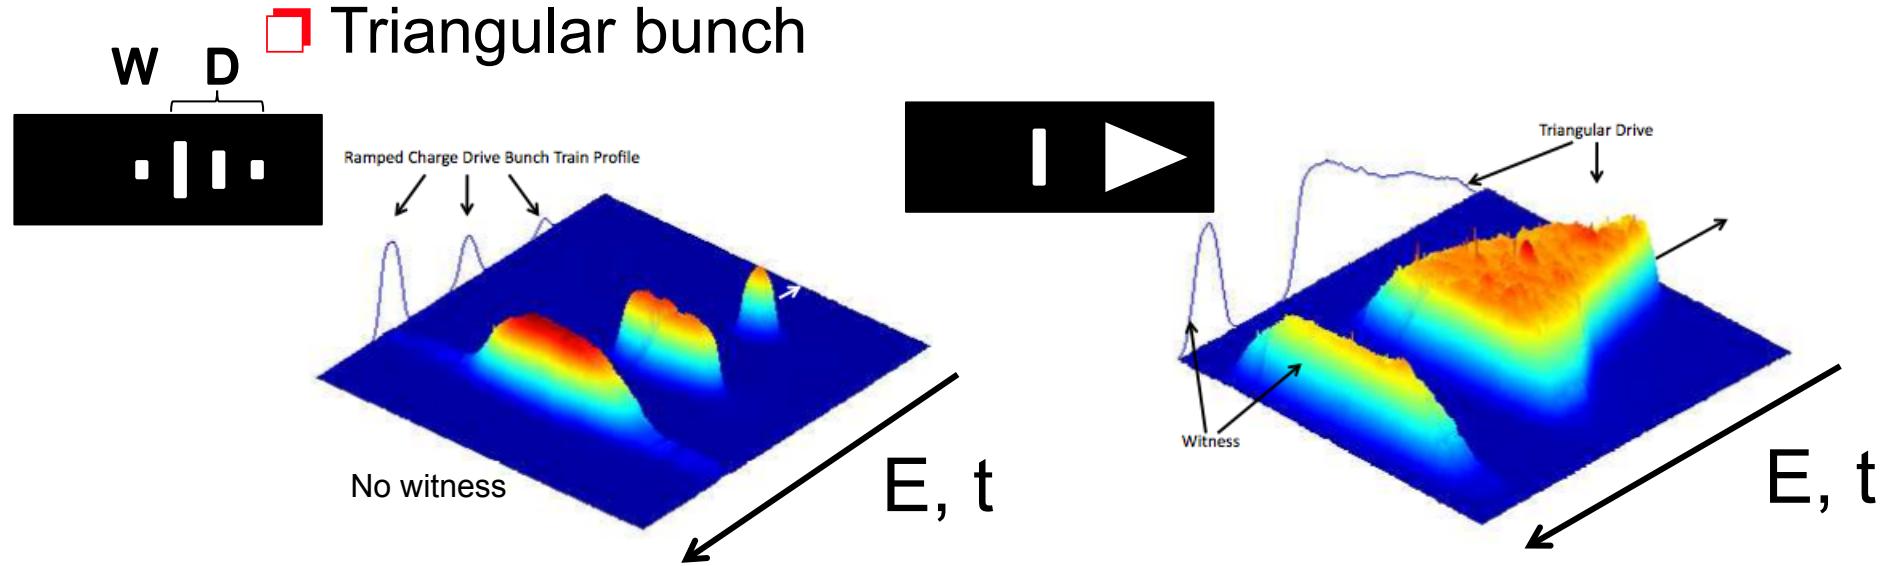

## OTHER Low ENERGY EXPERIMENTS

- ❑ Large transformer ratio PWFA

- ❑ Ramped bunch train

- ❑ Triangular bunch

- ❑ Application to dielectric loaded accelerator (DLA)
- ❑ Access to nonlinear regime with tight focusing
- ❑ Access to beam current filamentation instability with relevance to plasma physics, astrophysics, ICF

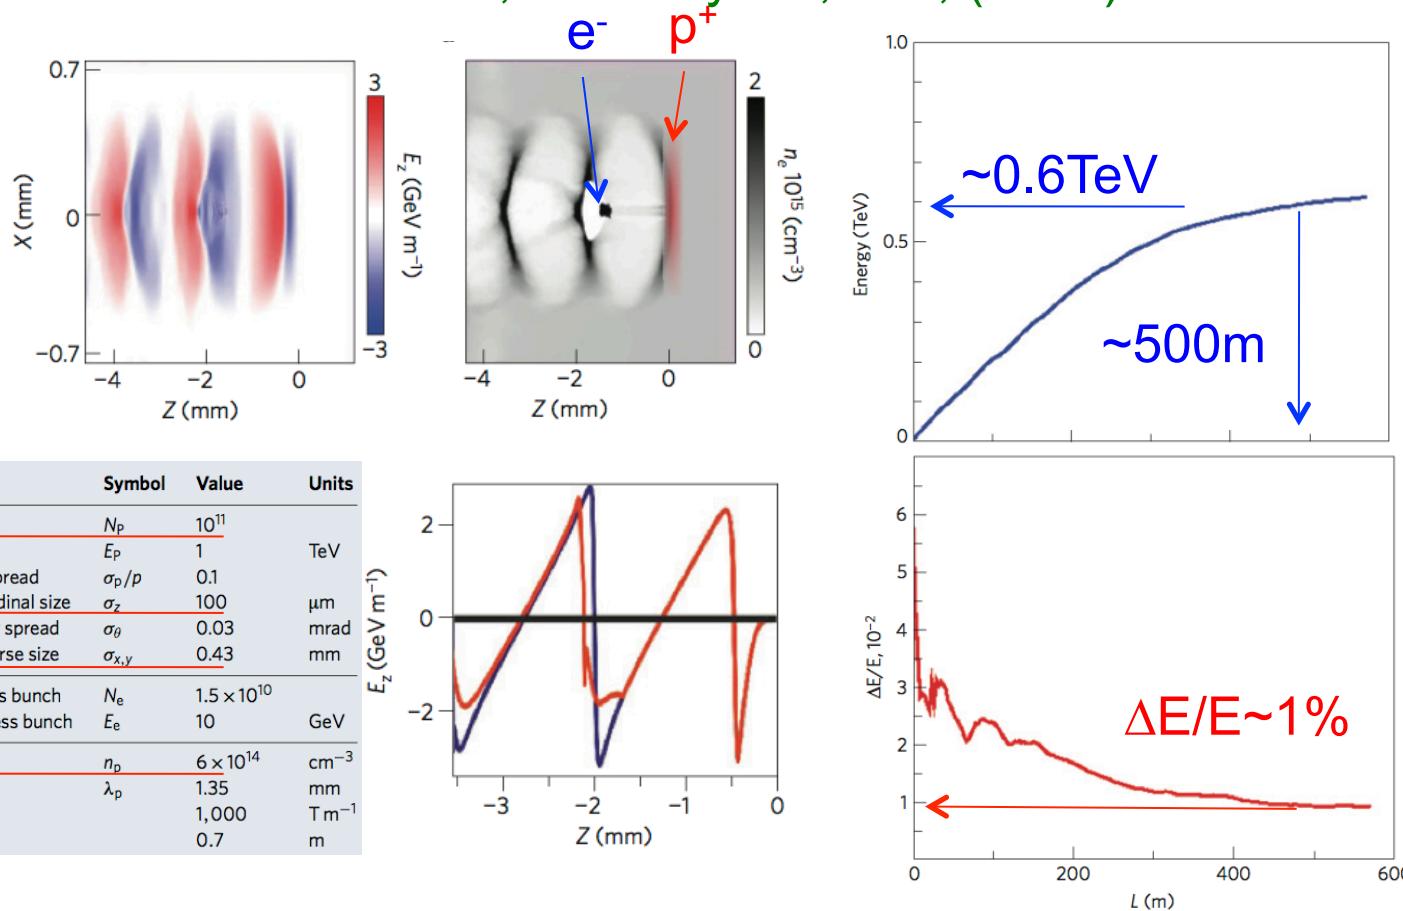

- ❑ A SPS, 450GeV bunch with  $10^{11} p^+$  caries 7.2kJ
- ❑ A LHC, 7TeV bunch with  $10^{11} p^+$  caries 11.2kJ
- ❑ An ILC, 0.5TeV bunch with  $2 \times 10^{10} e^-$  caries 1.6kJ
  
- ❑ A single SPS or LHC bunch could produce an ILC bunch in a single PWFA stage!
  
- ❑ These  $p^+$  are not very relativistic => dephasing
  
- ❑ Long plasmas may be required ( $\sim 100's\ m$ )
  
- ❑ Short ( $\sim 100\mu m$ ) bunches do not exist!

# PROTON-DRIVEN PWFA @ CERN

Caldwell, Nat. Phys. 5, 363, (2009)

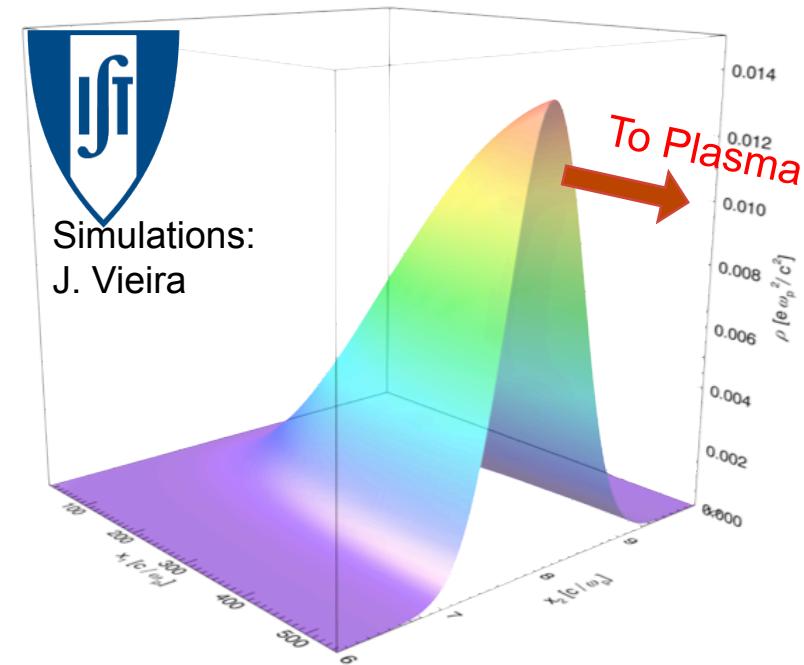

- ❑ Use “pancake”  $p^+$  bunch to drive non-linear wake (cylinder for  $e^-$  driver)
- ❑ Gradient  $\sim 1.5\text{GV/m}$ , efficiency  $\sim 10\%$
- ❑ ILC-like  $e^-$  bunch from a single  $p^+$ -driven PWFA

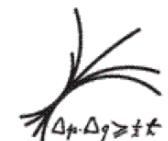

# PROTON-DRIVEN PWFA @ CERN

- Short p+ bunches not available  
=> self modulation of long ( $\sim 12\text{cm} \sim 100\lambda_{pe}$ ), 450GeV SPS bunch

Proton bunch	Electron bunch
<ul style="list-style-type: none"> <li>‣ <math>\sigma_{  } = 12 \text{ cm}</math></li> <li>‣ <math>\sigma_{\perp} = 200 \mu\text{m}</math></li> <li>‣ <math>n_b/n_0 = 0.00217</math> (linear PWFA)</li> <li>‣ <math>\gamma = 479.6</math></li> <li>‣ <math>N = 11.5 \times 10^{10}</math> (<math>30.0 \times 10^{10}</math>)</li> </ul>	<ul style="list-style-type: none"> <li>‣ <math>\sigma_{  } = 100 \text{ mm}</math></li> <li>‣ <math>\sigma_{\perp} = 200 \mu\text{m}</math></li> <li>‣ <math>n_b/n_0 = 1.32 \times 10^{-7}</math></li> <li>‣ <math>\gamma = 20</math> (10 MeV)</li> </ul>

- Simulations assume seeding of the instability (cut p+ bunch, short laser pulse, e- bunch, ...)

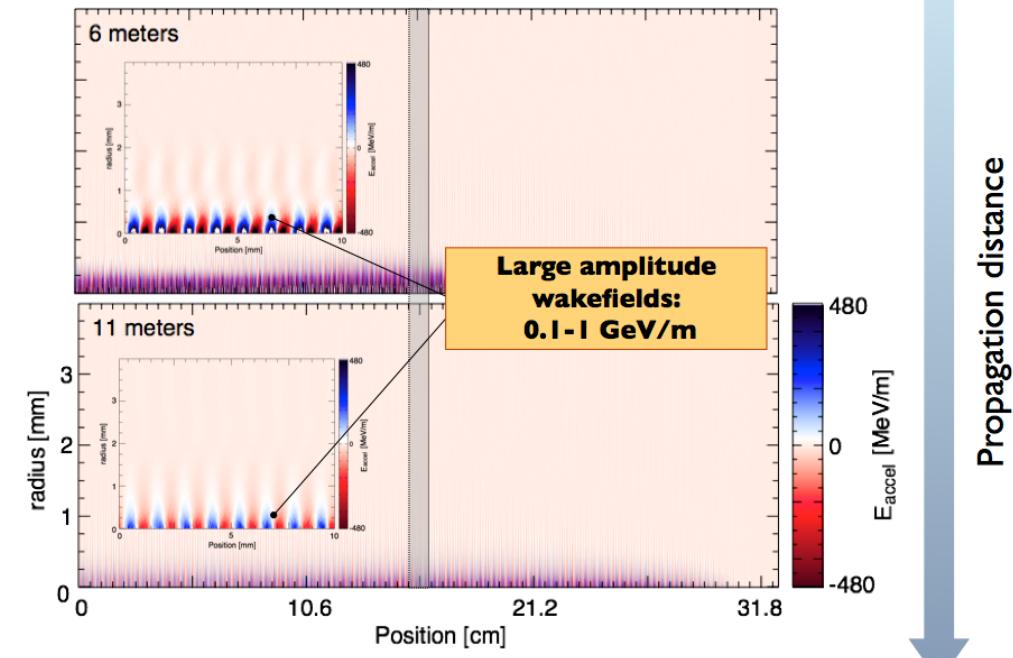

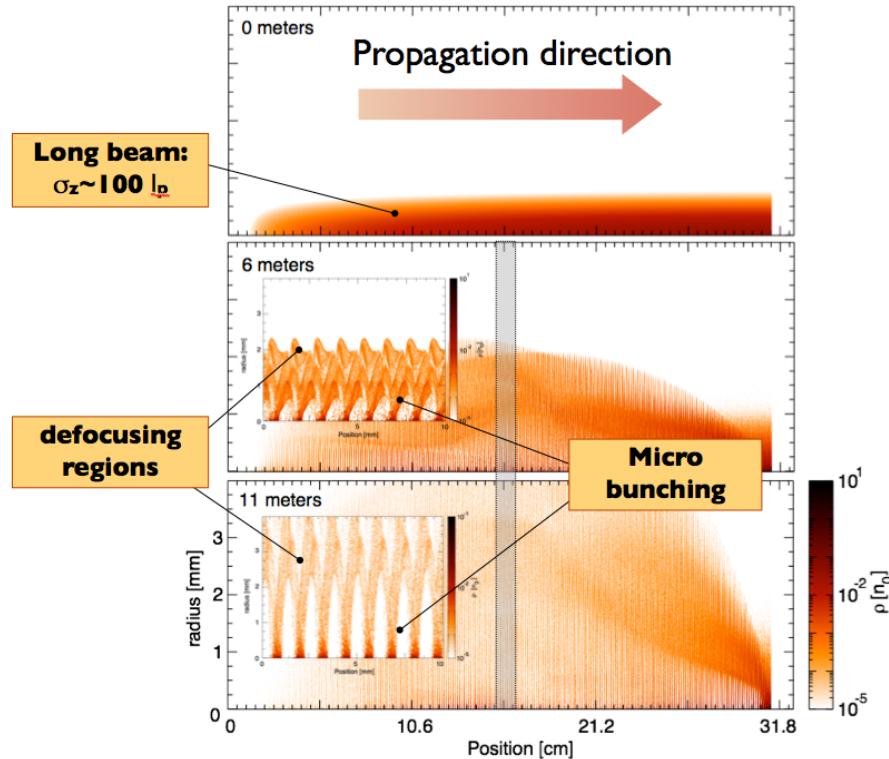

# PROTON-DRIVEN PWFA @ CERN

- Transverse two-stream instability

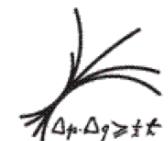

N. Kumar et al., Phys. Rev. Lett. 104, 255003 (2010).

=> self modulation of long (~12cm), 450GeV SPS bunch @ $\lambda_p$

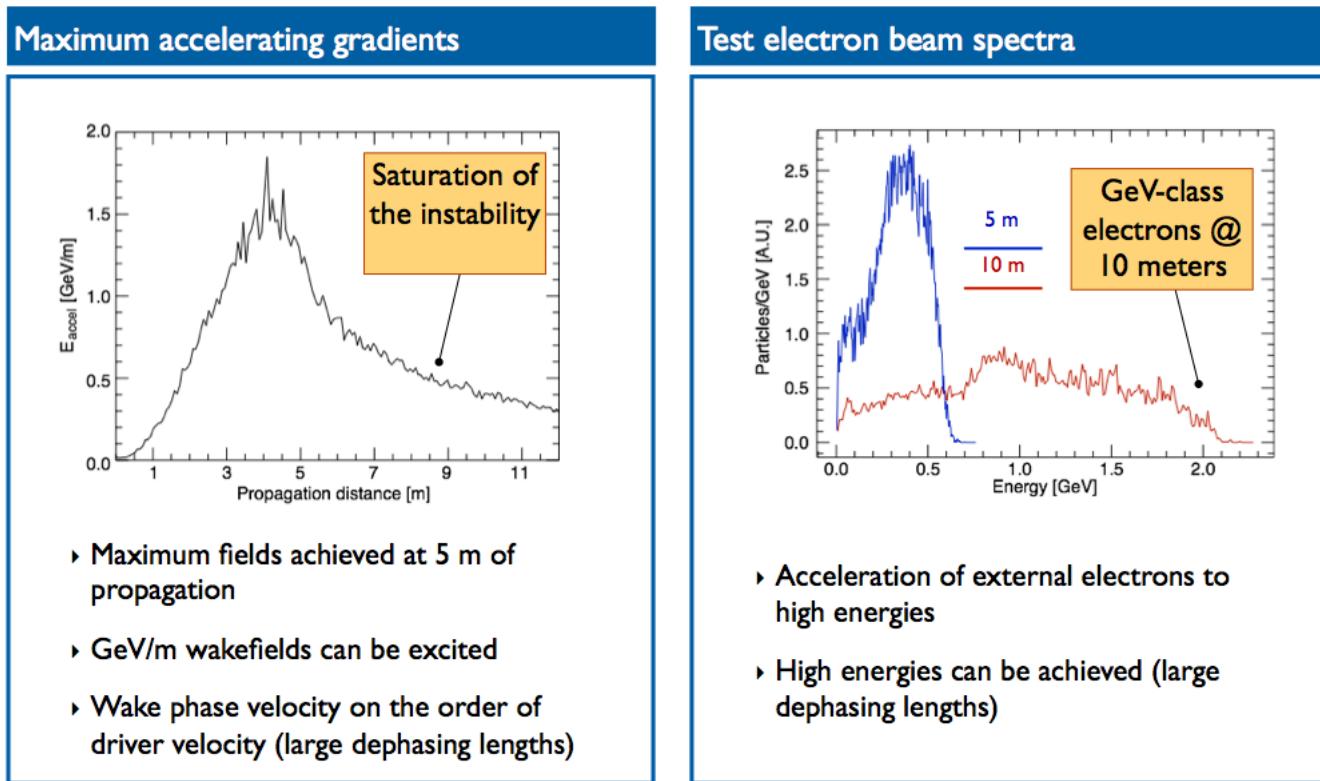

Simulations: J. Vieira

- Drives large amplitude (0.1-1GV/m) accelerating fields
- $E_z$  (acceleration) sampled by injecting (~10MeV)  $e^-$  bunch

# PROTON-DRIVEN PWFA @ CERN

- Self modulation of long (~12cm), 450GeV SPS bunch

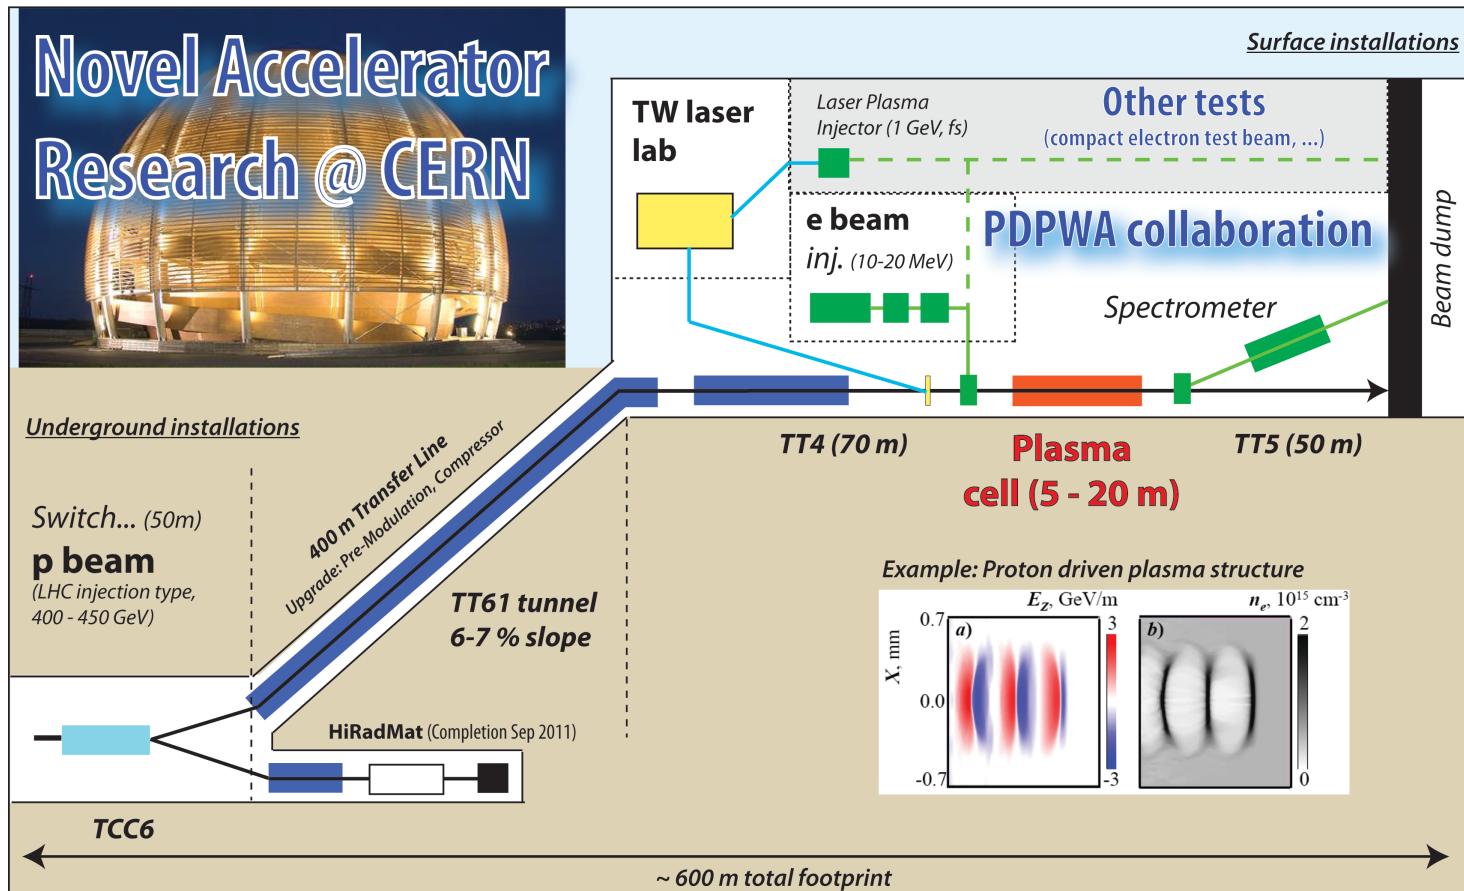

- Growth of instability /  $p^+$  density modulation /  $E_z$
- Injected  $e^-$  gain ~1GeV in 5-10m plasma
- Injected of short  $e^-$  bunch would produce narrow  $\Delta E/E$

Simulations: J. Vieira

# PROTON-DRIVEN PWFA @ CERN

- Letter of intent submitted to CERN for self-modulated  $p^+$ -driven PWFA experiments
- Experiments 2015-... for 1GeV in 1m
- Program for TeV class e- from  $p^+$ -driven PWFA, driven by MPP

## Summary and Conclusions

- ❑ PWFA made remarkable progress
  - ❑ 42GeV energy gain in 85cm of plasma
- ❑ Low energy experiments study PWFA physics
- ❑ PWFA is well understood
- ❑ Many more results: multi-GeV trapped  $e^-$ , emittance, ...
- ❑ FACET@SLAC will address PWFA collider issues
  - ❑ Acceleration of witness bunch ( $\Delta E/E_0 \sim 1\%$ )
  - ❑  $e^+$  ...
  - ❑ Single,  $e^-/e^+$ , +25 GeV PWFA stage
- ❑ Proton-driven PWFA to be proposed to CERN, PWFA at DESY and in Japan, about to start at INFN, DESY-Zeuthen, ...
- ❑ PWFA is a possible technology candidate for future more compact (cheaper) collider and light sources
- ❑ Watch for laser-driven plasma-based accelerators (LWFA)
