

Update on background estimation and future planning

Riccardo Cenci
University of Maryland

Background Simulation Meeting

Jun 28th, 2012

New Productions

- 2012 official productions (**thicker tungsten shielding**):
 - **2photons** (~100k evts, 372us) solenoidal field limited in z, ± 40 cm
 - **RadBhabha** (~10k evts, 37us)
 - **Touschek**: (~87k evts HER, ~198k LER, weighted evts)
 - **Beamgas** (~284k evts HER, ~282k evts LER, weighted evts)
- 2012, additional productions:
 - **RadBhabha** (~10k evts, 37us) old tungsten shielding
 - **RadBhabha** (~10k evts, 37us) CSI, only for EMC studies

New entry

Rate comparison, updated

SVT

- Hopefully we definitively fixed the problem with failed jobs
- 2photons with new L0 geometry: 30-50% decrease on L0, slightly higher for outer layers

Summary on bkg levels

- SVT:
 - New geometry shows a significant reduction for L0 rates but bkg is still too high for frontend electronics. Under evaluation impact on offline performance with x5 safety factor, first impression is that it should be ok
- DCH:
 - Increased shielding lowered the radiative BhaBha contribution, rate are within tolerance with the present configuration
 - Current internal inner radius of chamber is 237mm, but the first layer starts at 246-252 mm. Increasing this radius could increase the rate in the inner layers. New layer configurations provided by Giuseppe (first layer starts at an even greater radius) can be tested, but for a more reliable result we need to set the chamber inner radius closer to the first layer
- ETD:
 - New detailed map of radiation level for requested locations around the detector, all sources are included. Apart for SVT region, radiation levels look acceptable

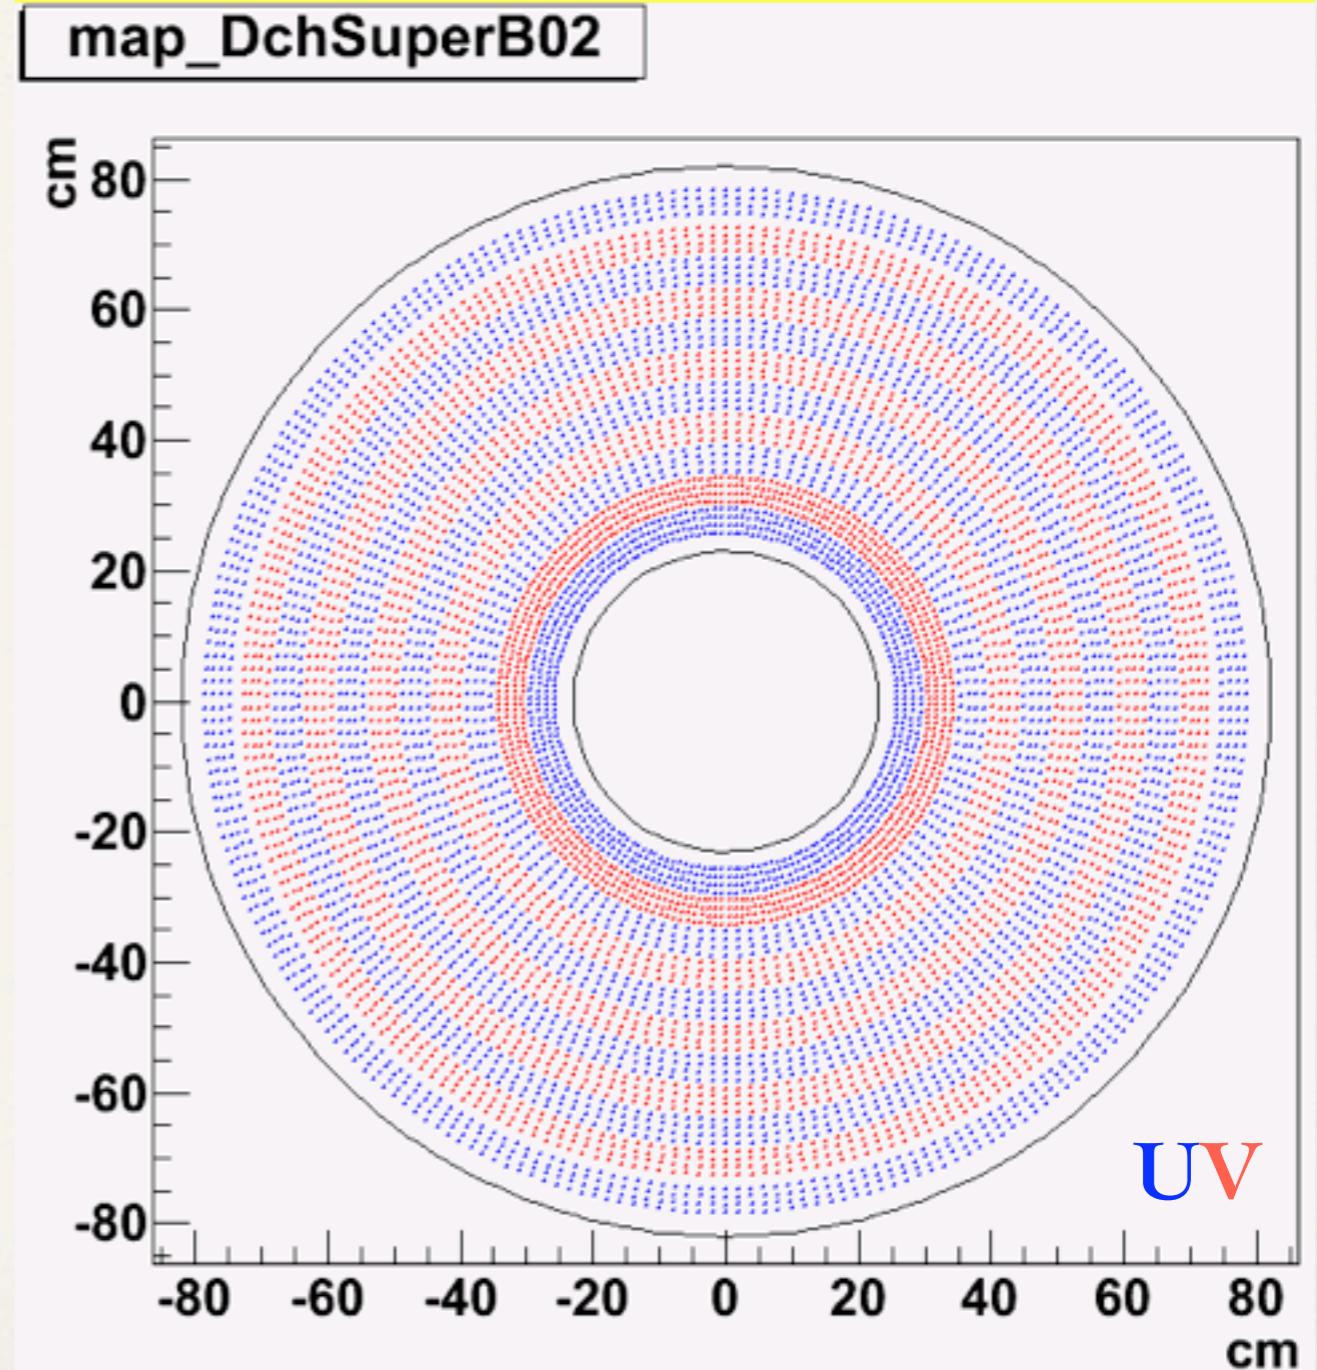

Radiation monitors location

- Used for private production, only 2photon
- Svt L0 striplets plus electronics by F. Bosi
 - Si[200um] (0.2 X0)
 - FanOut x 2, Si[40um]-Kapton [50um]-Si[40um] (0.21 X0)
- Materials can be easily changed, but total X0 is correct
- Carbon fiber support (only ribs over the active silicon), fanout tails, hydrids, FEE chips
- Radiation monitor need to be relocated
- Filippo spot some areas, maybe the shape would change a bit, but in principle should be easy to reinsert them
- I can do that (after discussing with RadMon people) or provide support

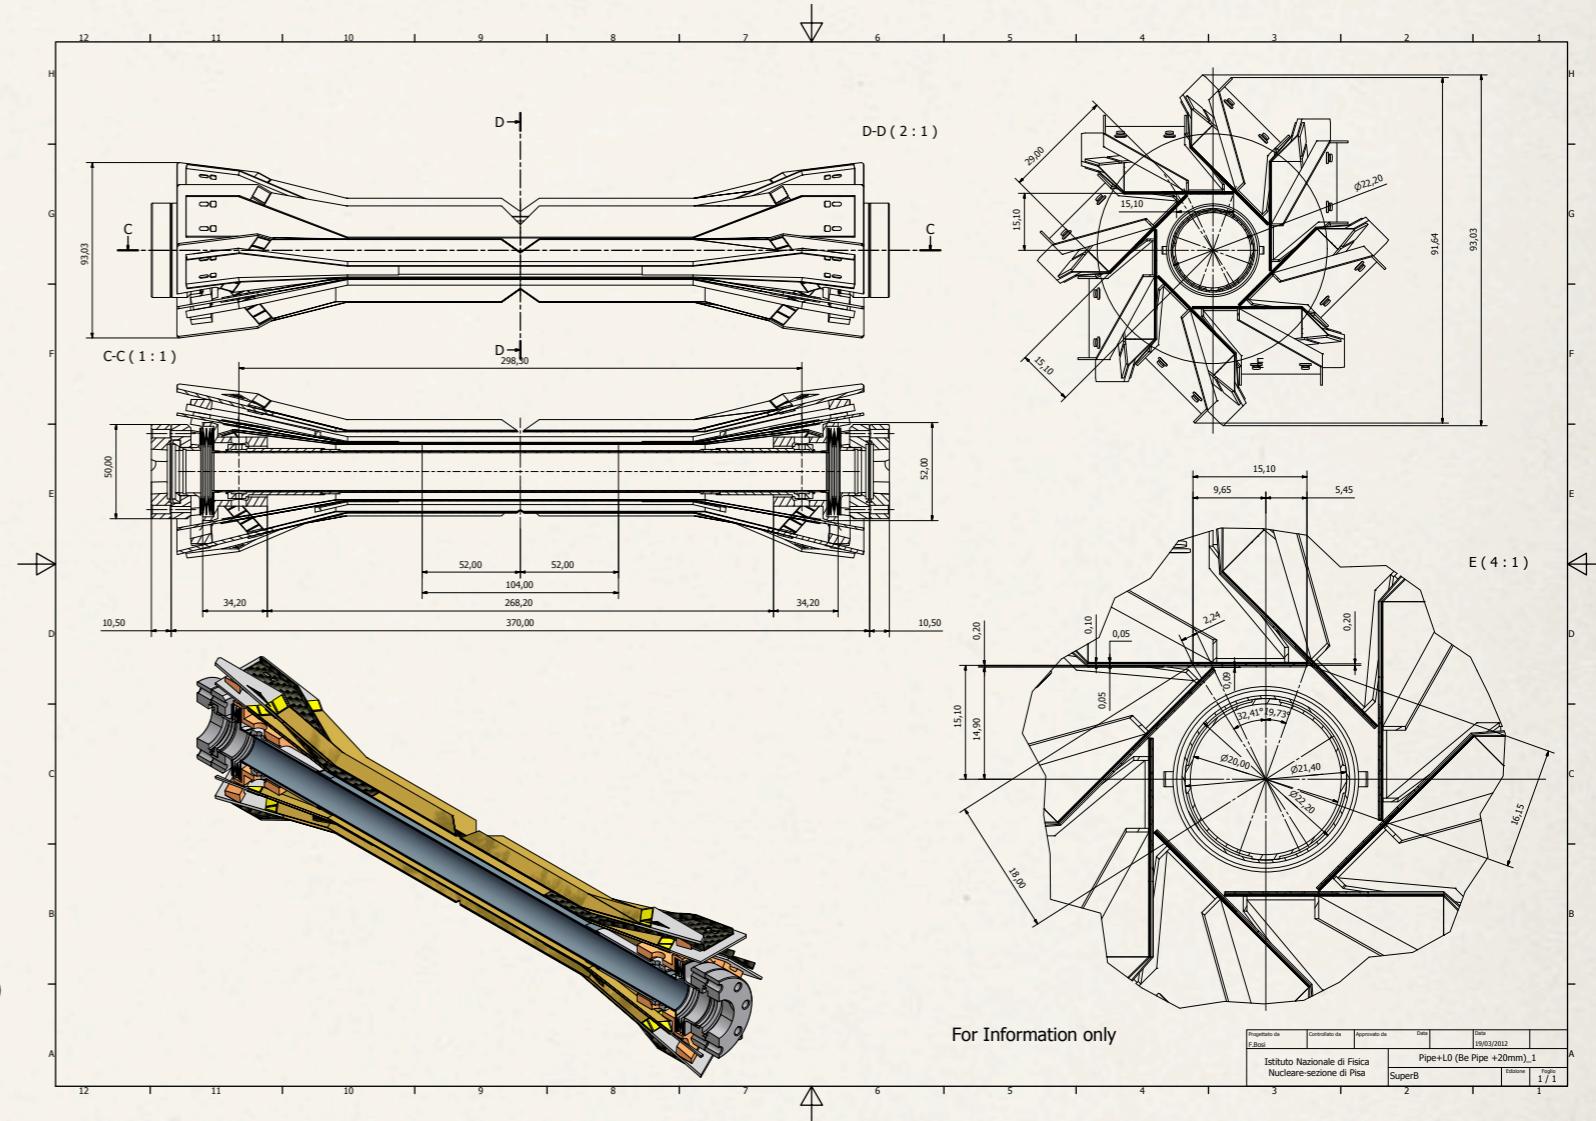

Dch configurations

- Inner wall of carbon fiber wall 236-237mm (discussion about thinning down the wall to .5mm)
- Old configurations:
 - **Axial01** version (1st layer 246mm)
 - AA-AAAAAAAA-AA
 - **SuperB01** version (1st layer 246mm)
 - AA-UVUVUVUV-A
 - **SuperB02** version (1st layer 252mm)
 - UVUVUVUVUV-U, fully axial
 - 8 inner layers, cell size ~1cm, then 2cm
 - 1cm empty space before last 4 layers
- New configurations (by Giuseppe):
 - 1st layer @ 264mm

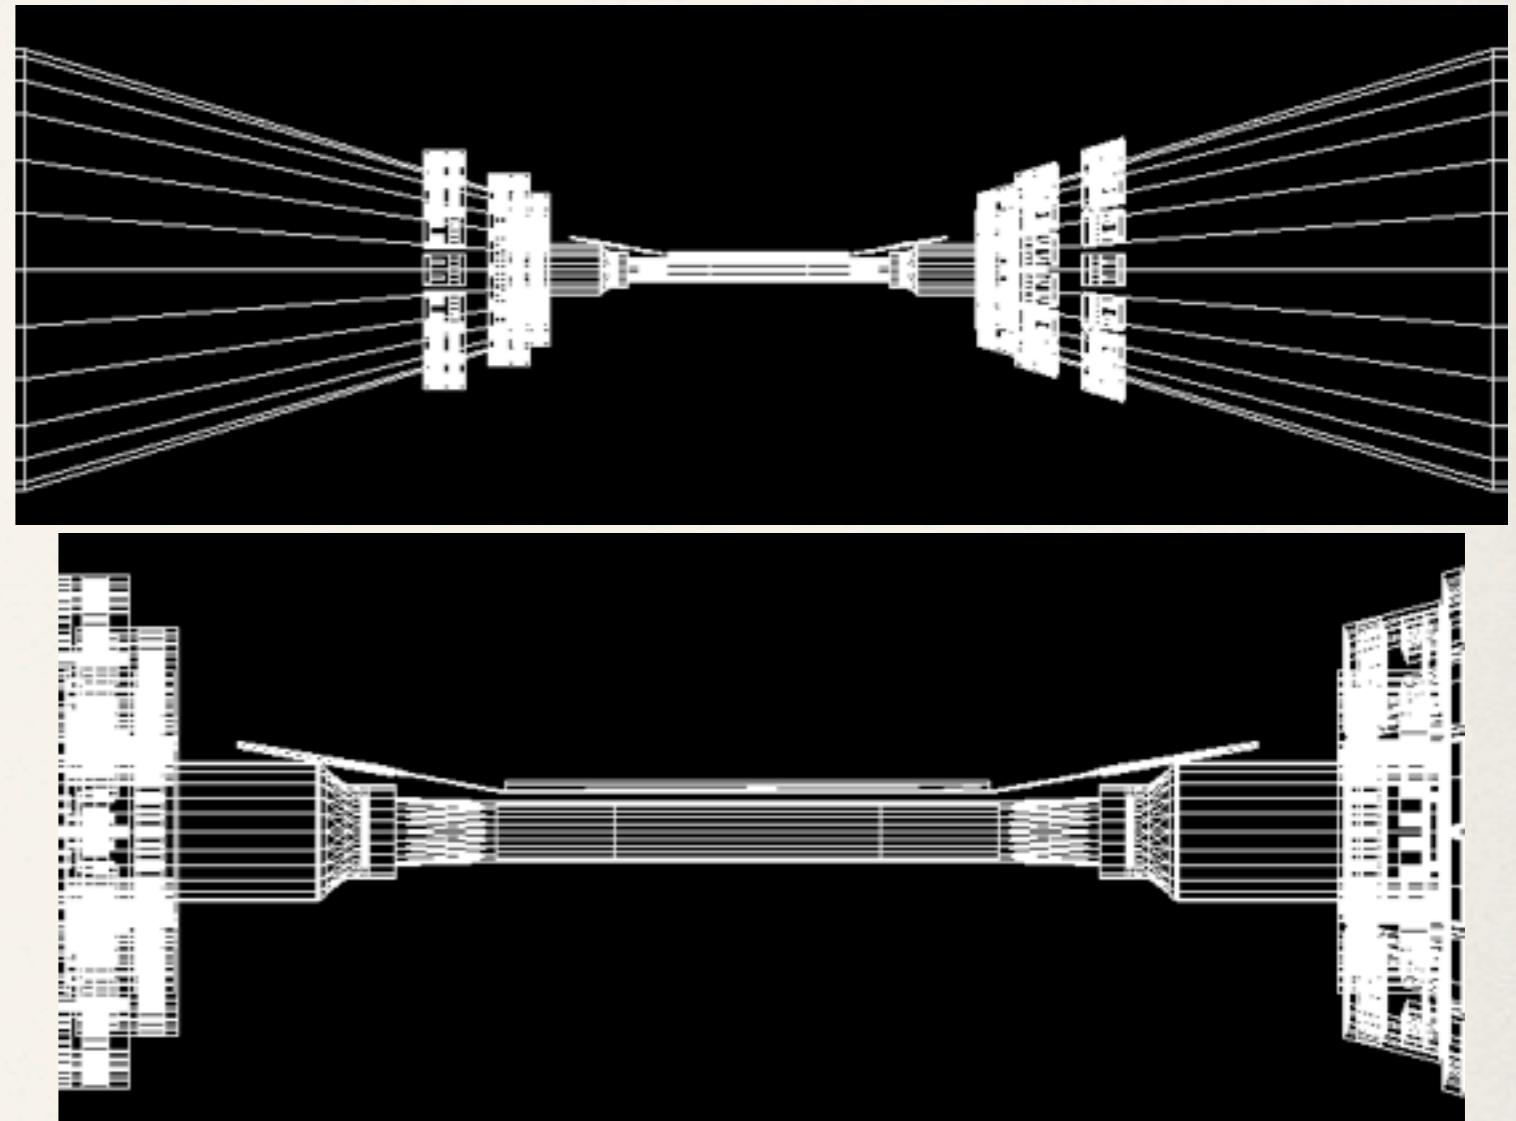

Future plans

- Not to be used for the next production
- Svt L0 geometry: a new design is ready for L0 with striplets.
 - Longer beampipe, split pipes are going to be shortened. No modification after that point
 - FEE boards for layers 1-2 to be relocated to make room for L0 boards
 - Svt geometry for outer layers: outer layers are the same as in Babar, but SuperB acceptance is wider. Need symmetric fwd/bwd modules

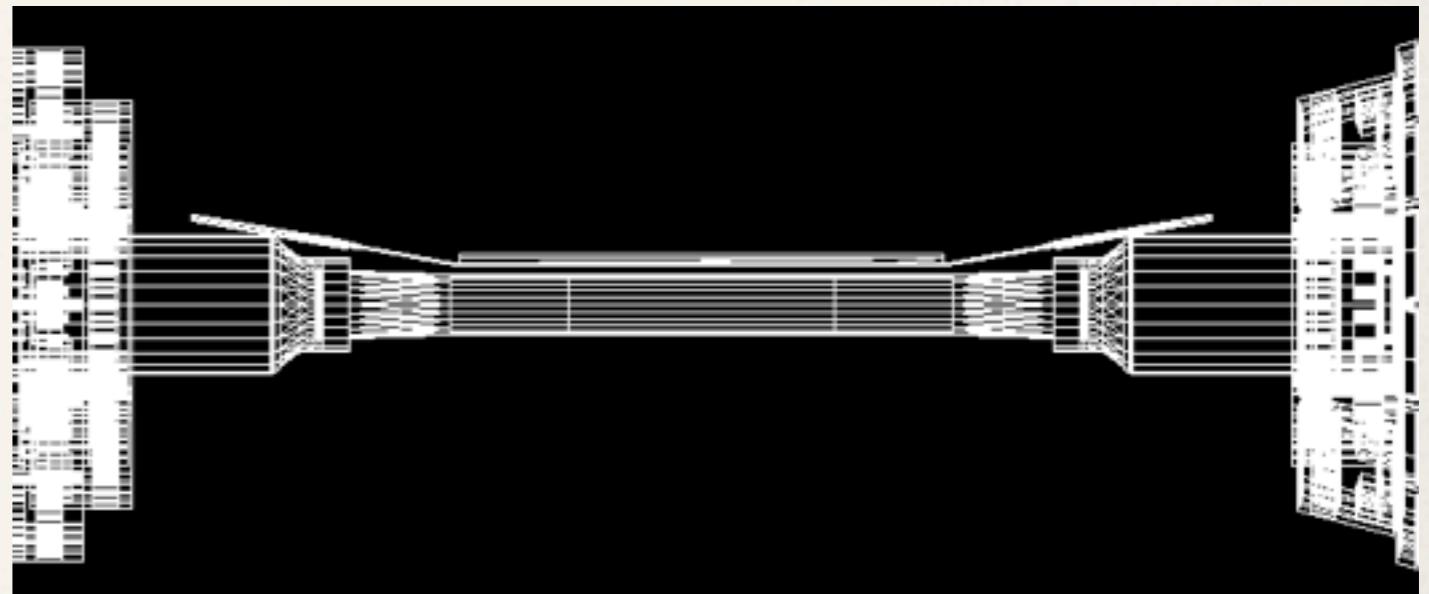

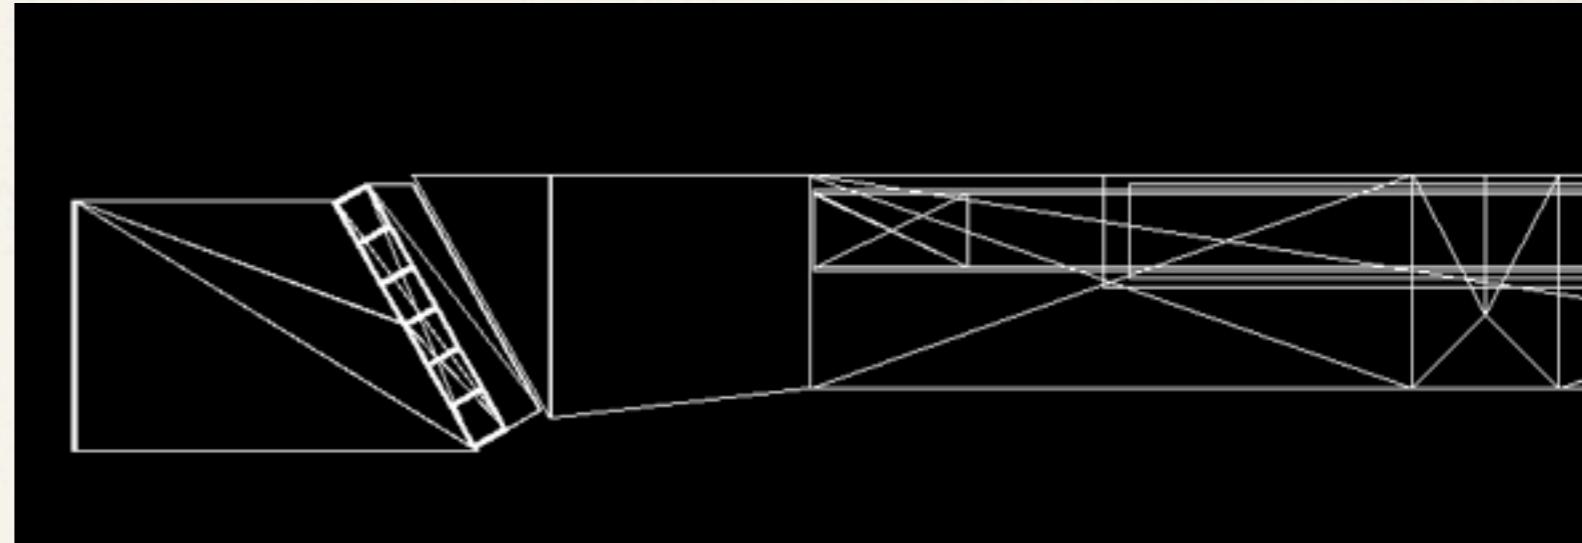

SVT striplets geometry

- Not to be used for the next production
- GDML version is **ready** and tested for overlaps
- Based on
Geometry_CIPE_V00-00-02
revision 359, tag for
V00-00-05
- Beampipe and final focus
modifications were easy
- Tungsten shielding is
completely symmetric wrt IP
- Relevant changes on how container volumes are implemented but no changes to the internal volumes of the final focus (apart for the beampipe and shortened split pipes)
- **IMPORTANT:** RadMon need to be re-inserted

SVT striplets geometry

- Not used for the May production
- Svt L0 striplets plus electronics by F. Bosi
 - Si[200um] (0.2 X0)
 - FanOut x 2, Si[40um]-Kapton [50um]-Si[40um] (0.21 X0)
- Materials can be easily changed, but total X0 is correct
- Carbon fiber support (only ribs over the active silicon), fanout tails, hybrids, FEE chips

- Missing parts for L0: carbon fiber supports over the hybrids, buttons
- Outer layers: some support parts have been removed due to overlaps, FEE moved out closer to the updated position but silicon is still like in Babar
- Matching cards: monitor volume moved to the correct position (according last drawings)

Simulated radiation level

- Request from ETD to have coherent map of radiation level for various locations of the detector
- Modeled after Atlas radiation tolerance criteria

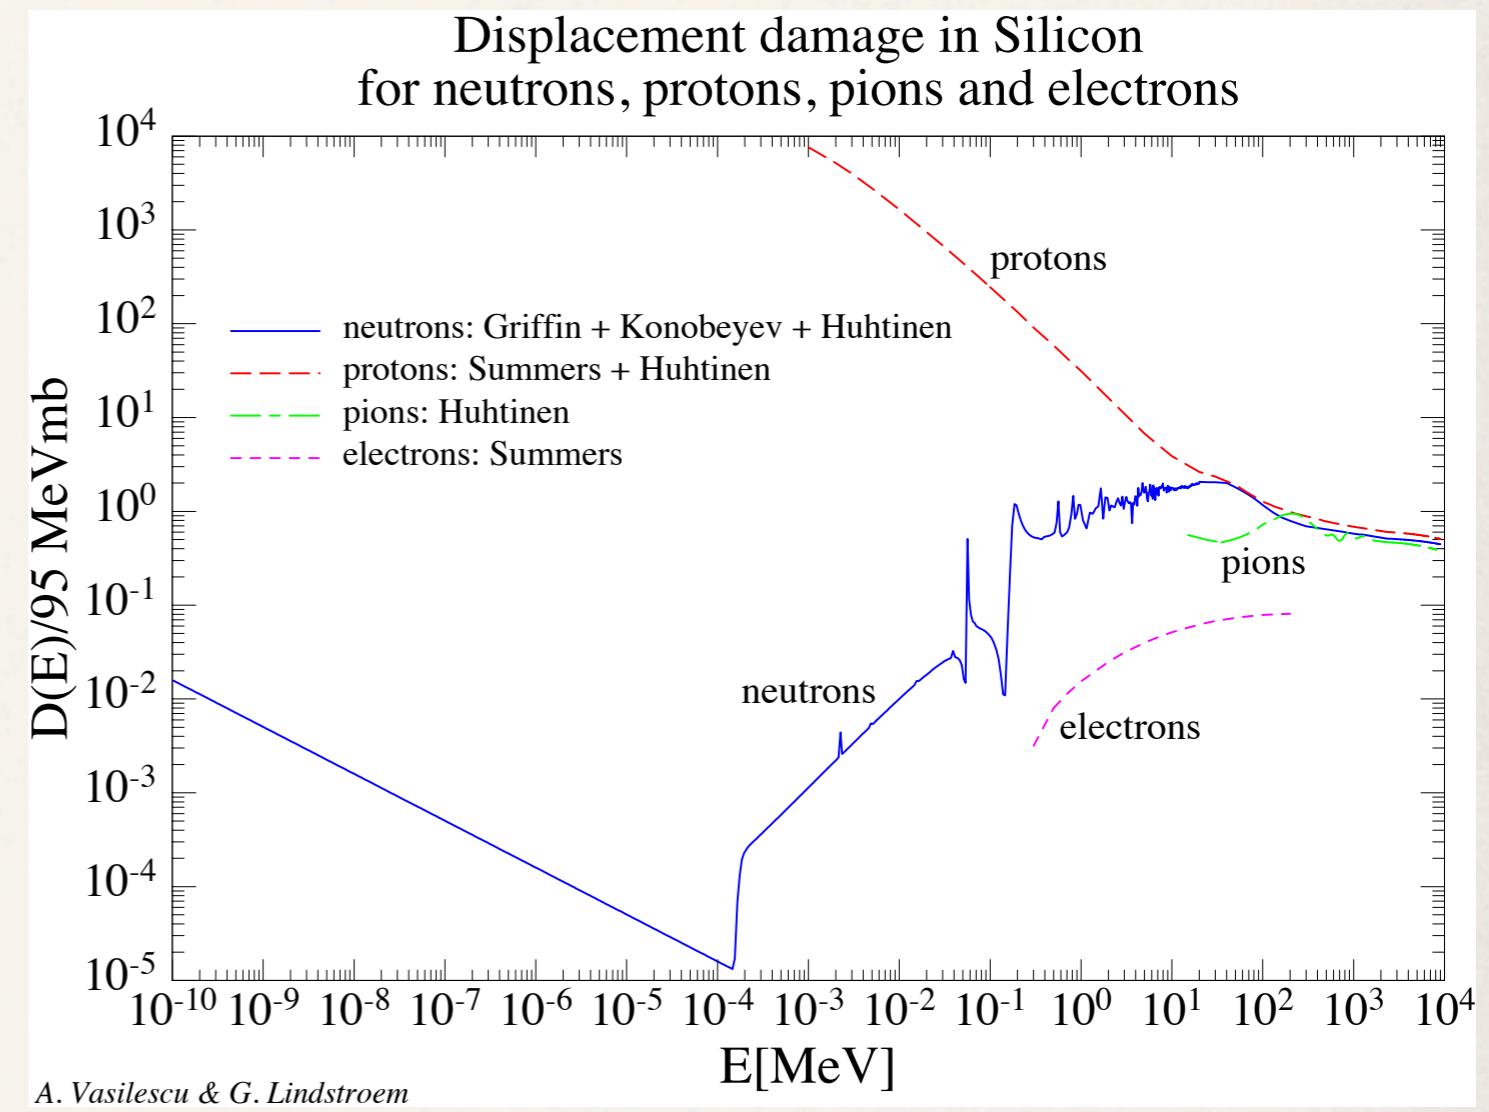

$\int f_i d\Omega$	$\int \frac{d\Omega}{4\pi} \phi_i$	$\int \frac{d\Omega}{4\pi} \phi_i^2$
SRL_{tid}	Particles producing <i>TID</i> (Total Ionising Dose). Example: photons.	Total Dose in 10 years: <i>Gray</i>
SRL_{niel}	Particles producing <i>NIEL</i> (Non-Ionising Energy Loss). Example: neutrons.	Total Fluence in 10 years: $1 \text{ MeV eq. neutron.cm}^{-2}$
SRL_{see}	Particles producing <i>SEE</i> (Single Event Effects). Example: heavy fragments.	Total Fluence in 10 years: $> 20 \text{ MeV hadron.cm}^{-2}$

From Atlas document

Table 1: Definition of the three types of simulated radiation levels

Simulated radiation level

- How quantities are computed:
 - **Dose (TID):**
 - total released energy in the sensitive volume divided by the weight
 - **Equivalent 1 MeV neutron flux (NIEL)**
 - each particle that cross the sensitive volume is weighted according the incident angle and using a conversion table (particle type and kinetic energy)
 - **Hadron Flux (SEE)**
 - flux of hadrons (proton, neutron, ions) with kinetic energy greater than 20 MeV

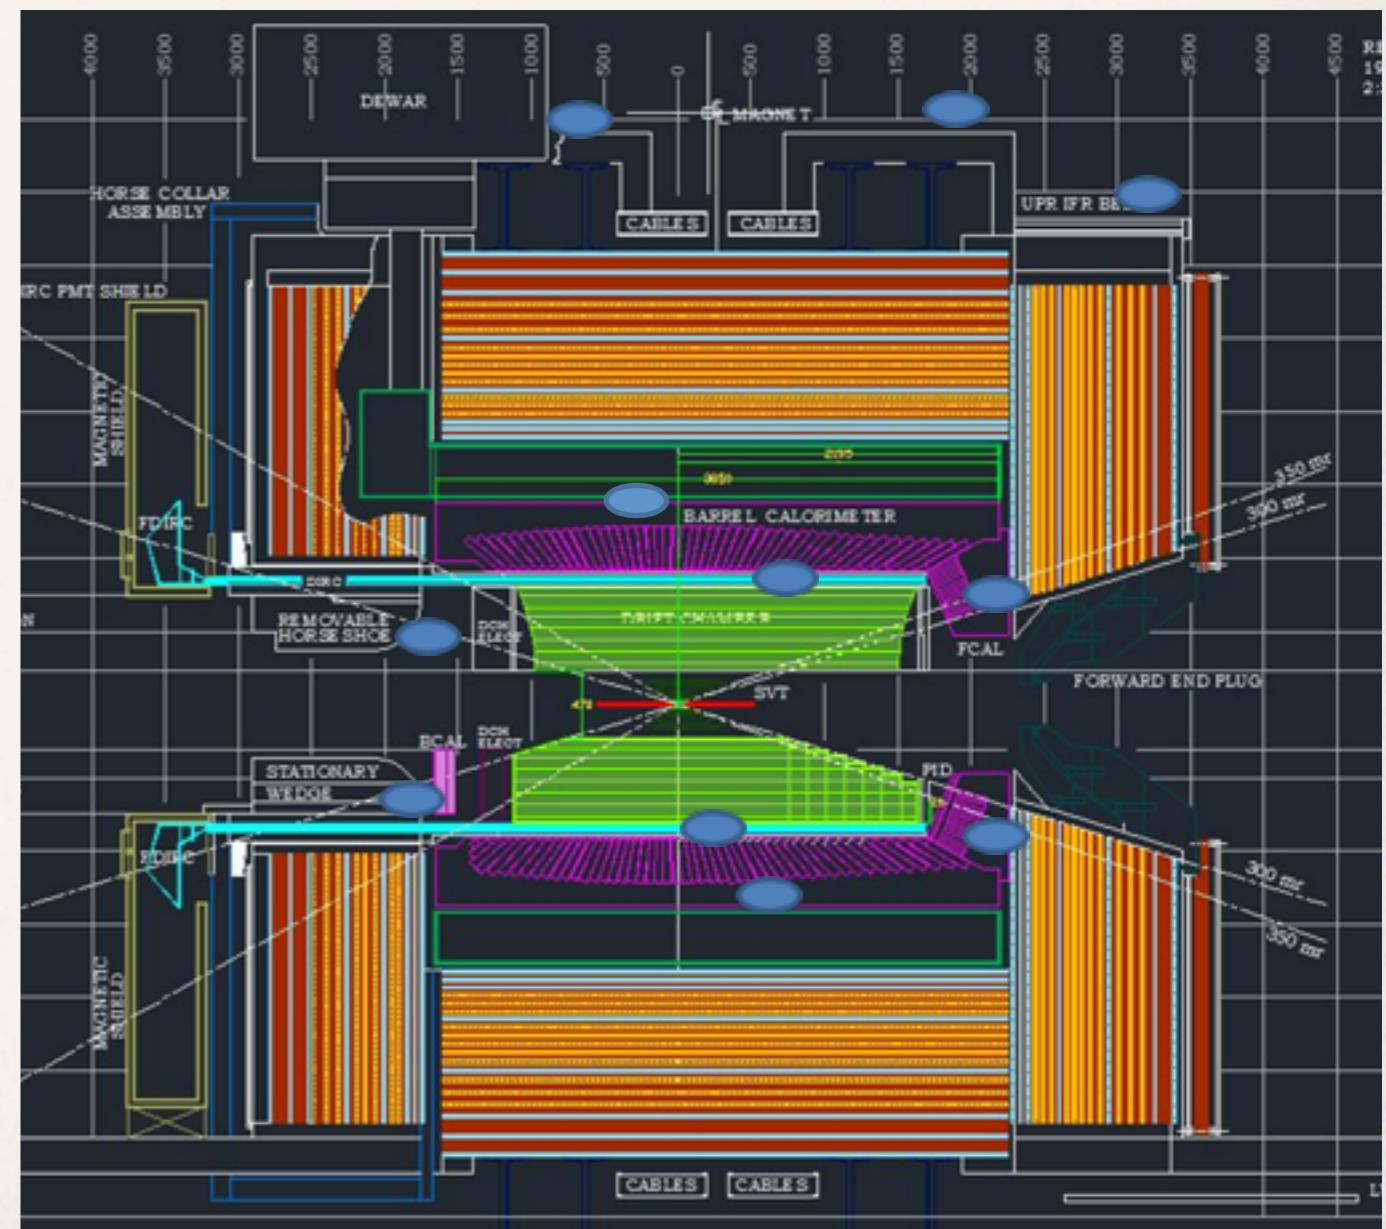

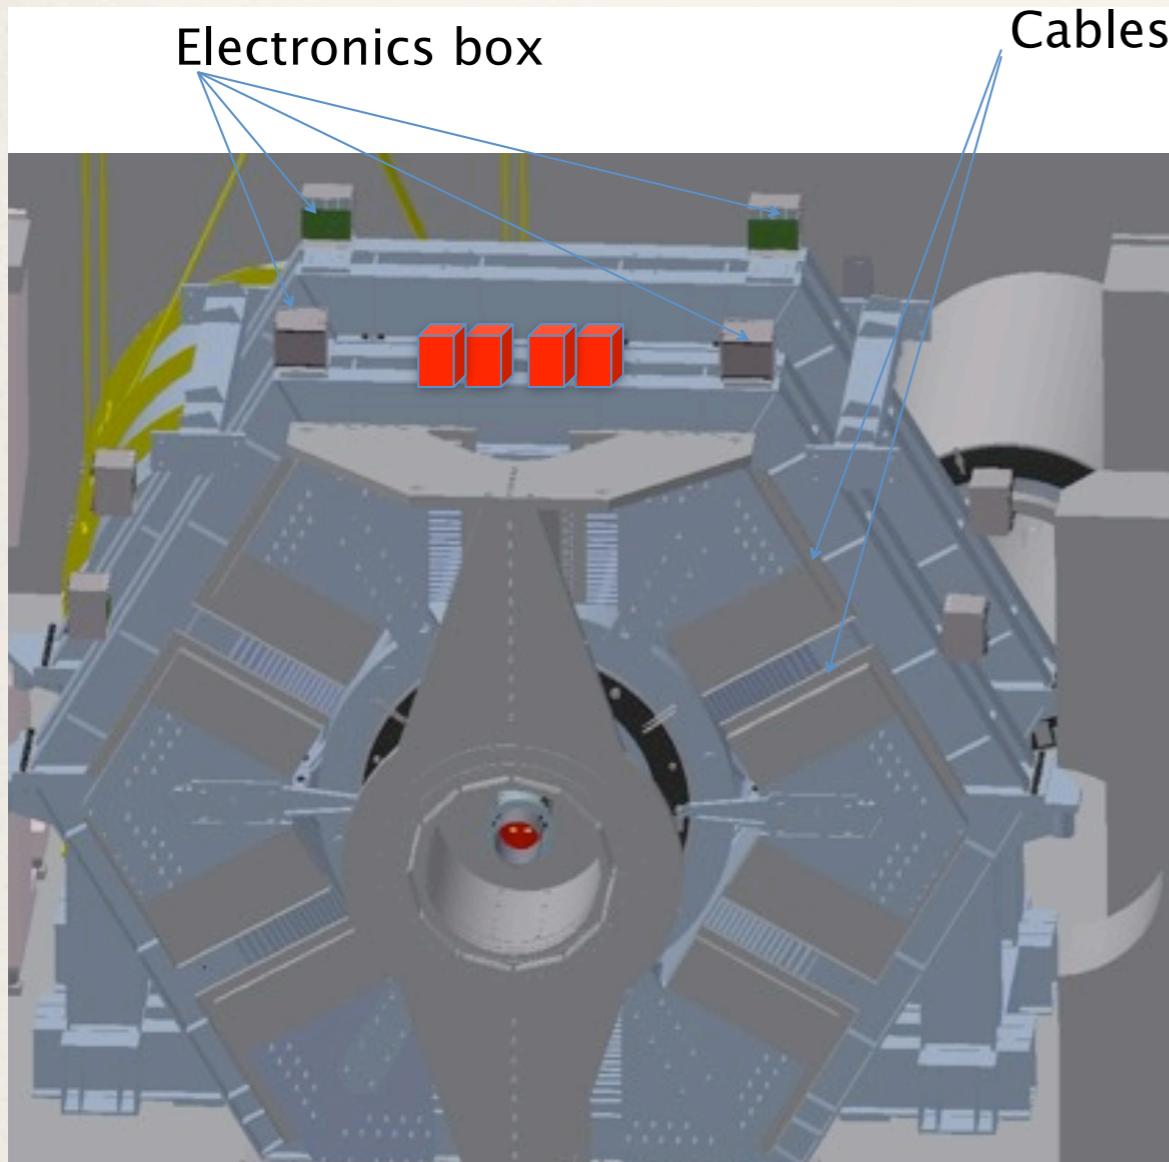

[Http://sesam.desy.de/members/gunnar/Si-dfuncs.html](http://sesam.desy.de/members/gunnar/Si-dfuncs.html)

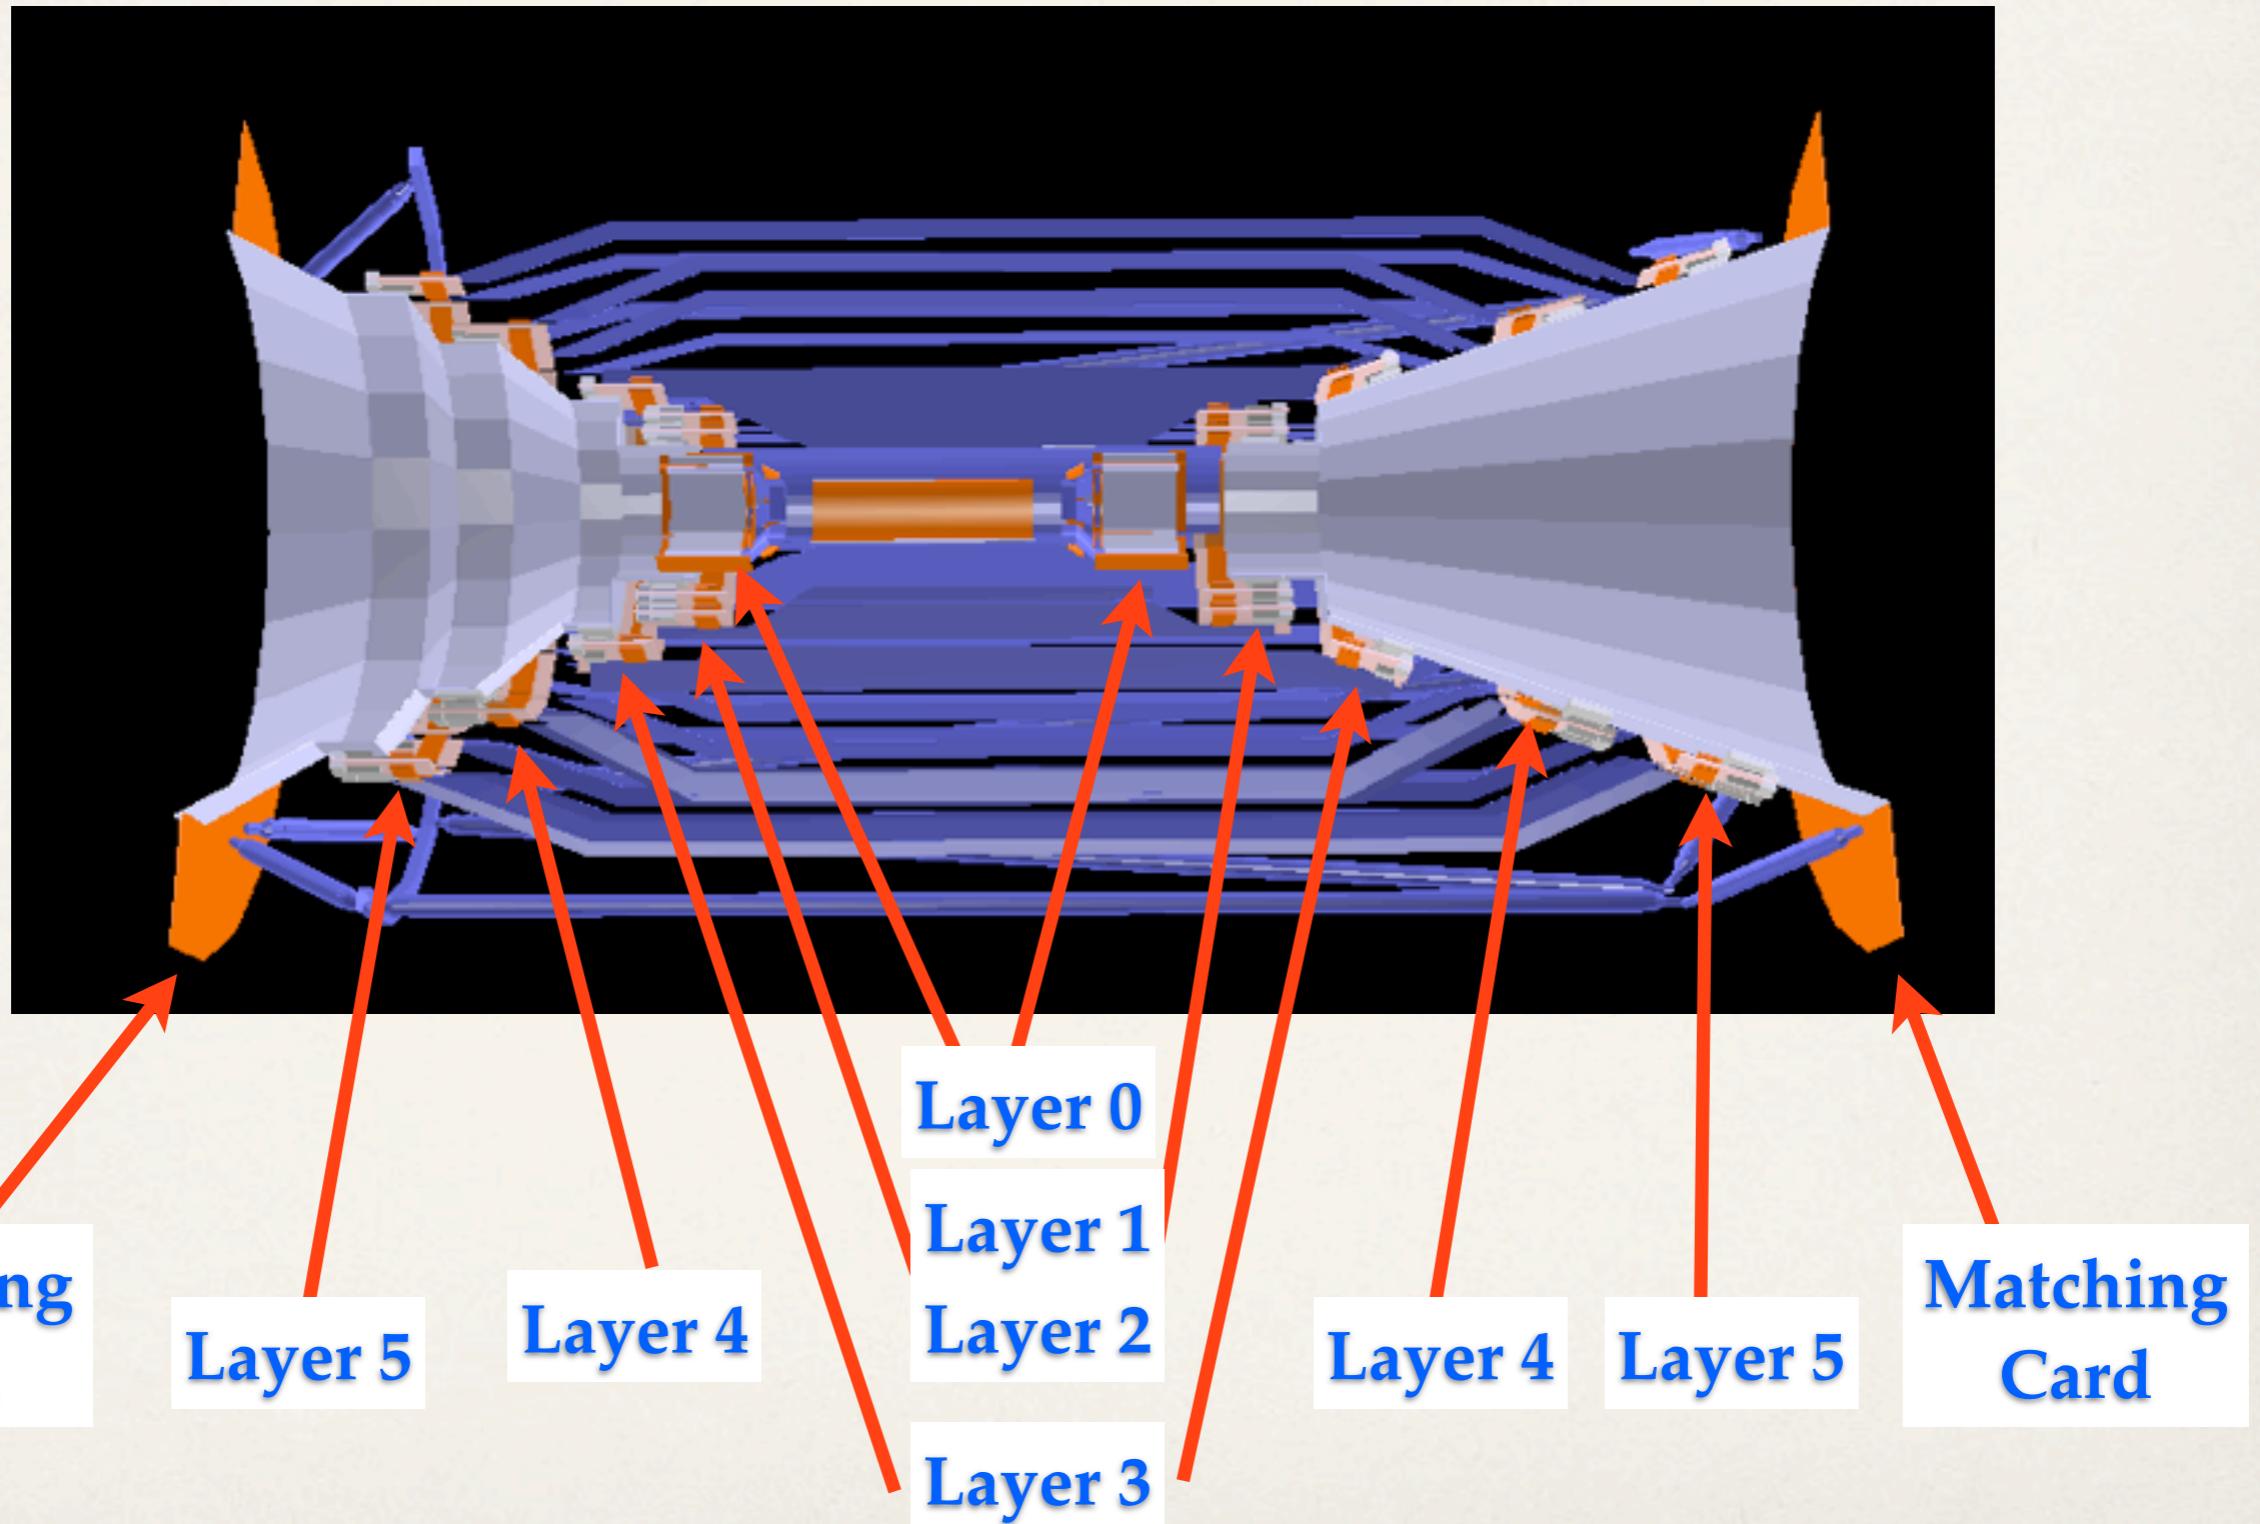

- For most of the locations the value is integrated over phi (measured over rings)

Simulated radiation level

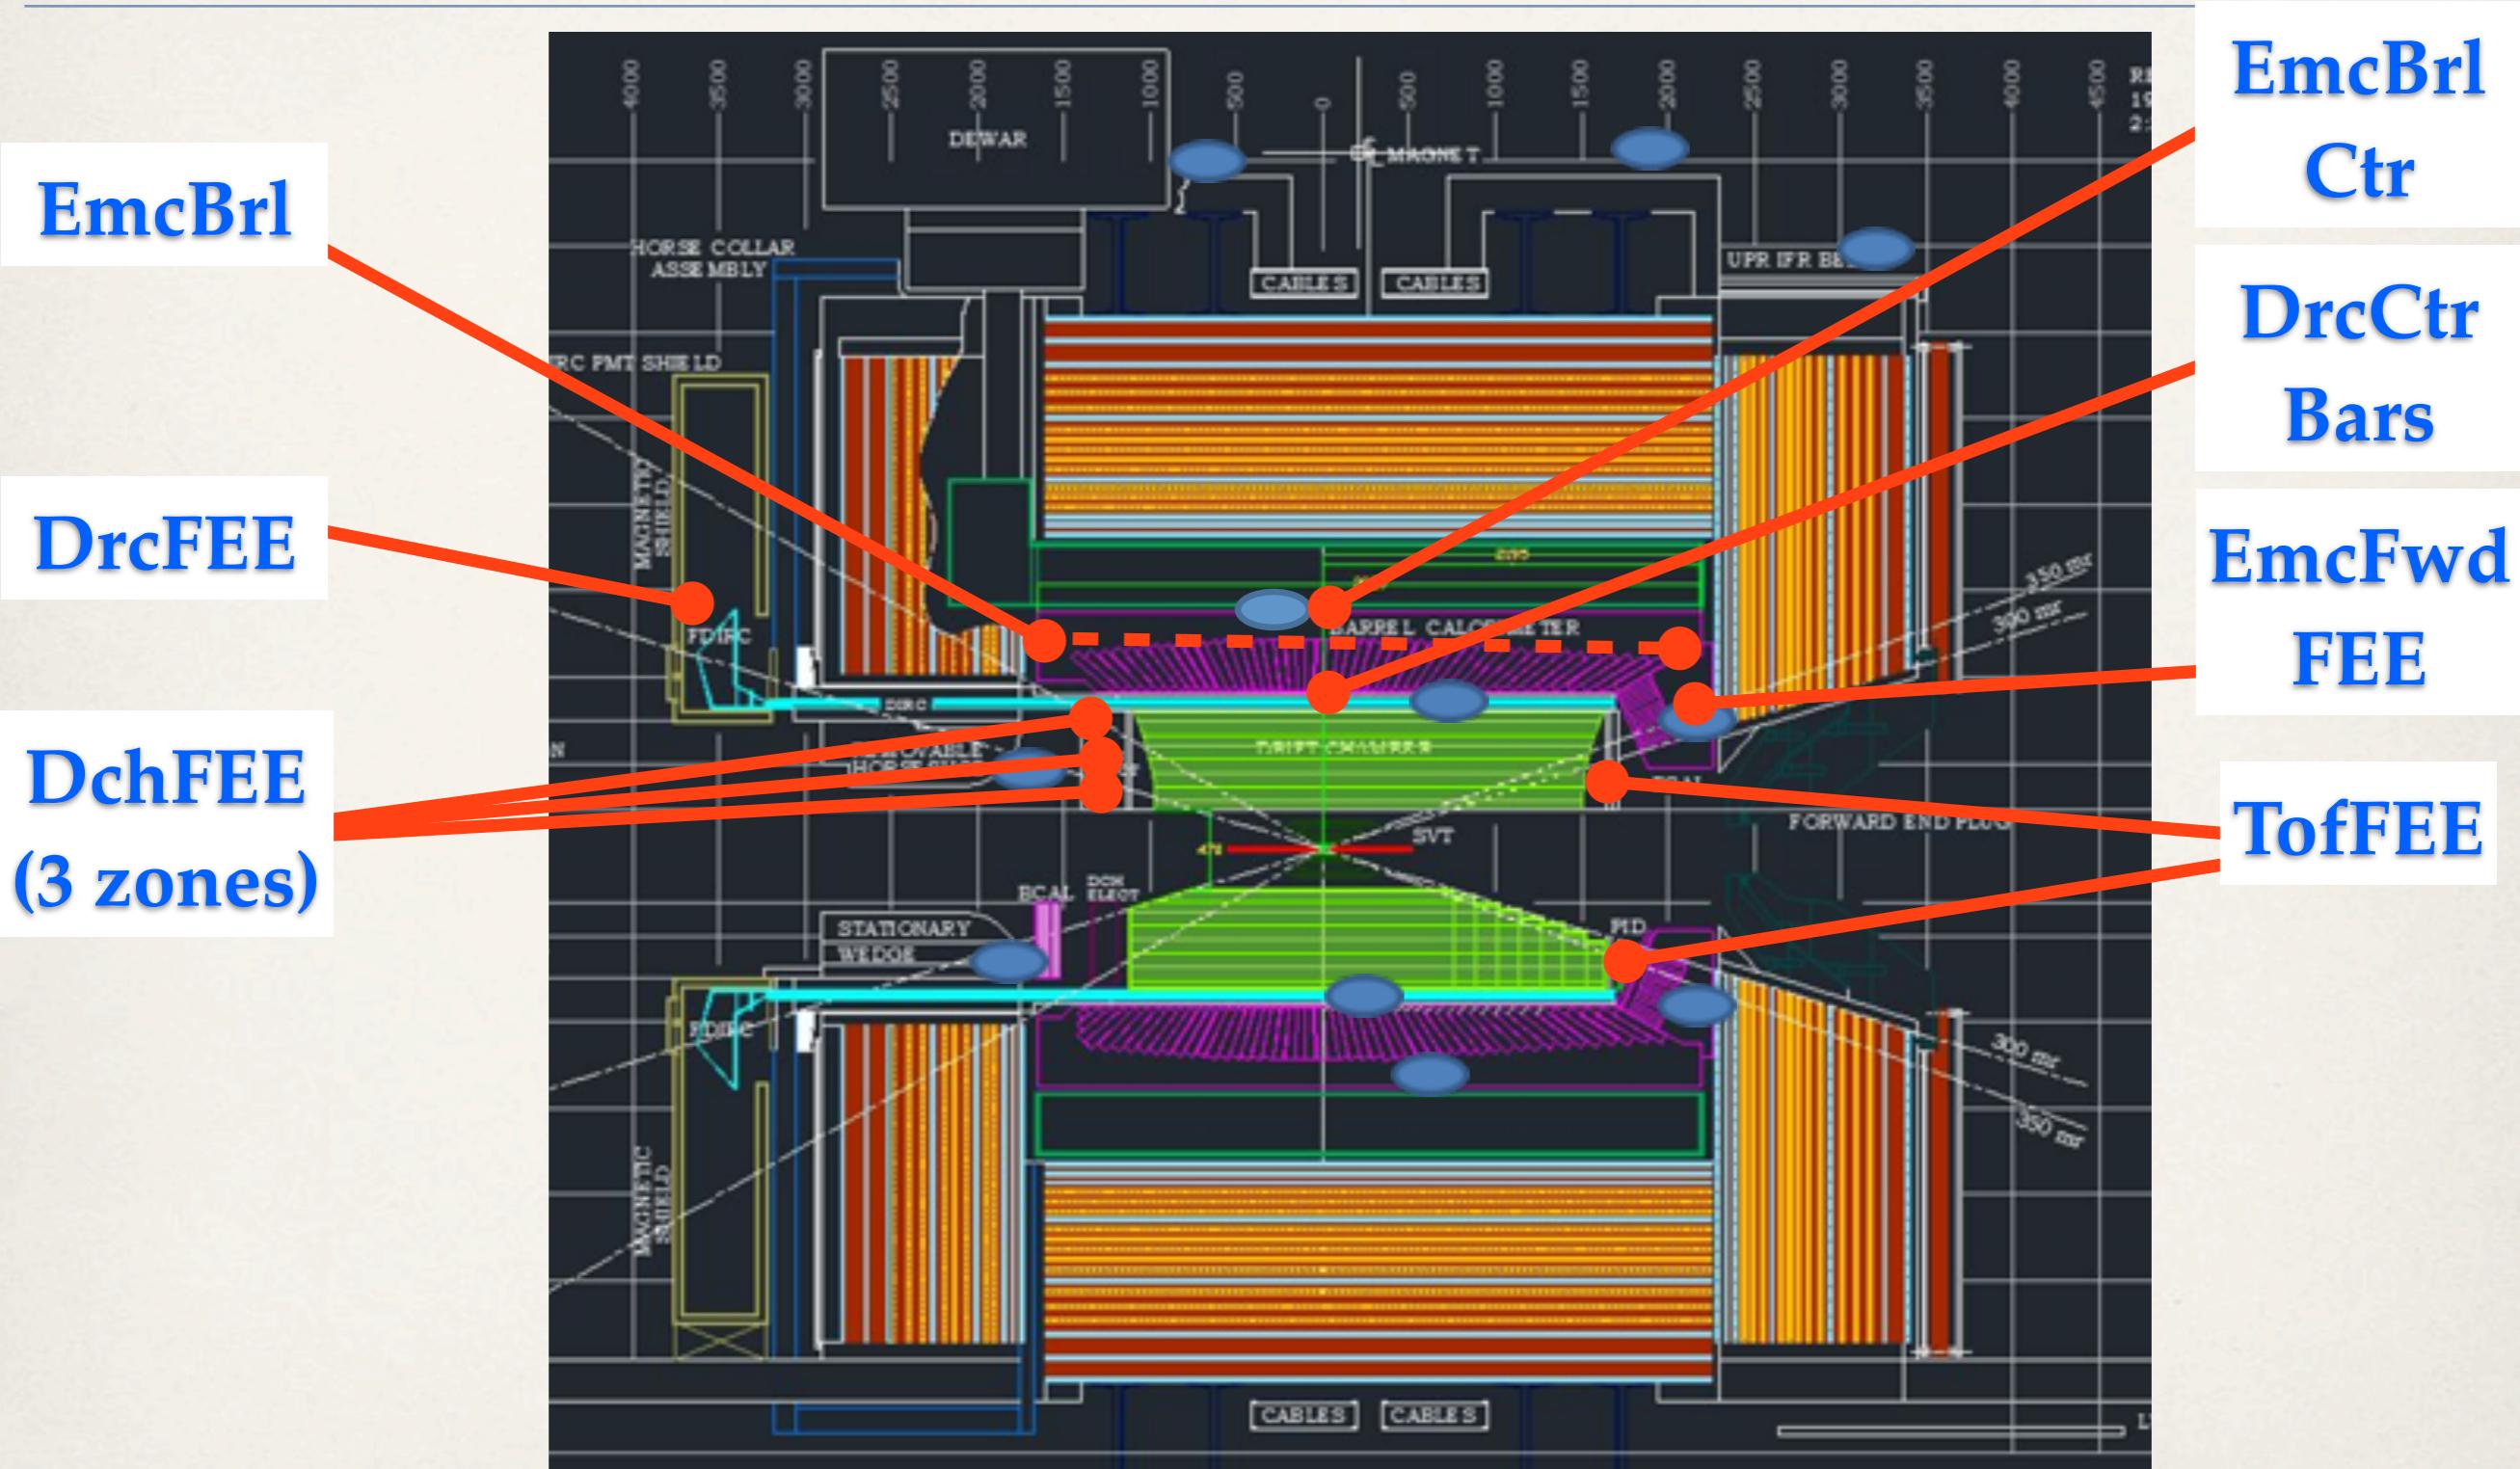

- Locations requested by ETD people

Simulated radiation level

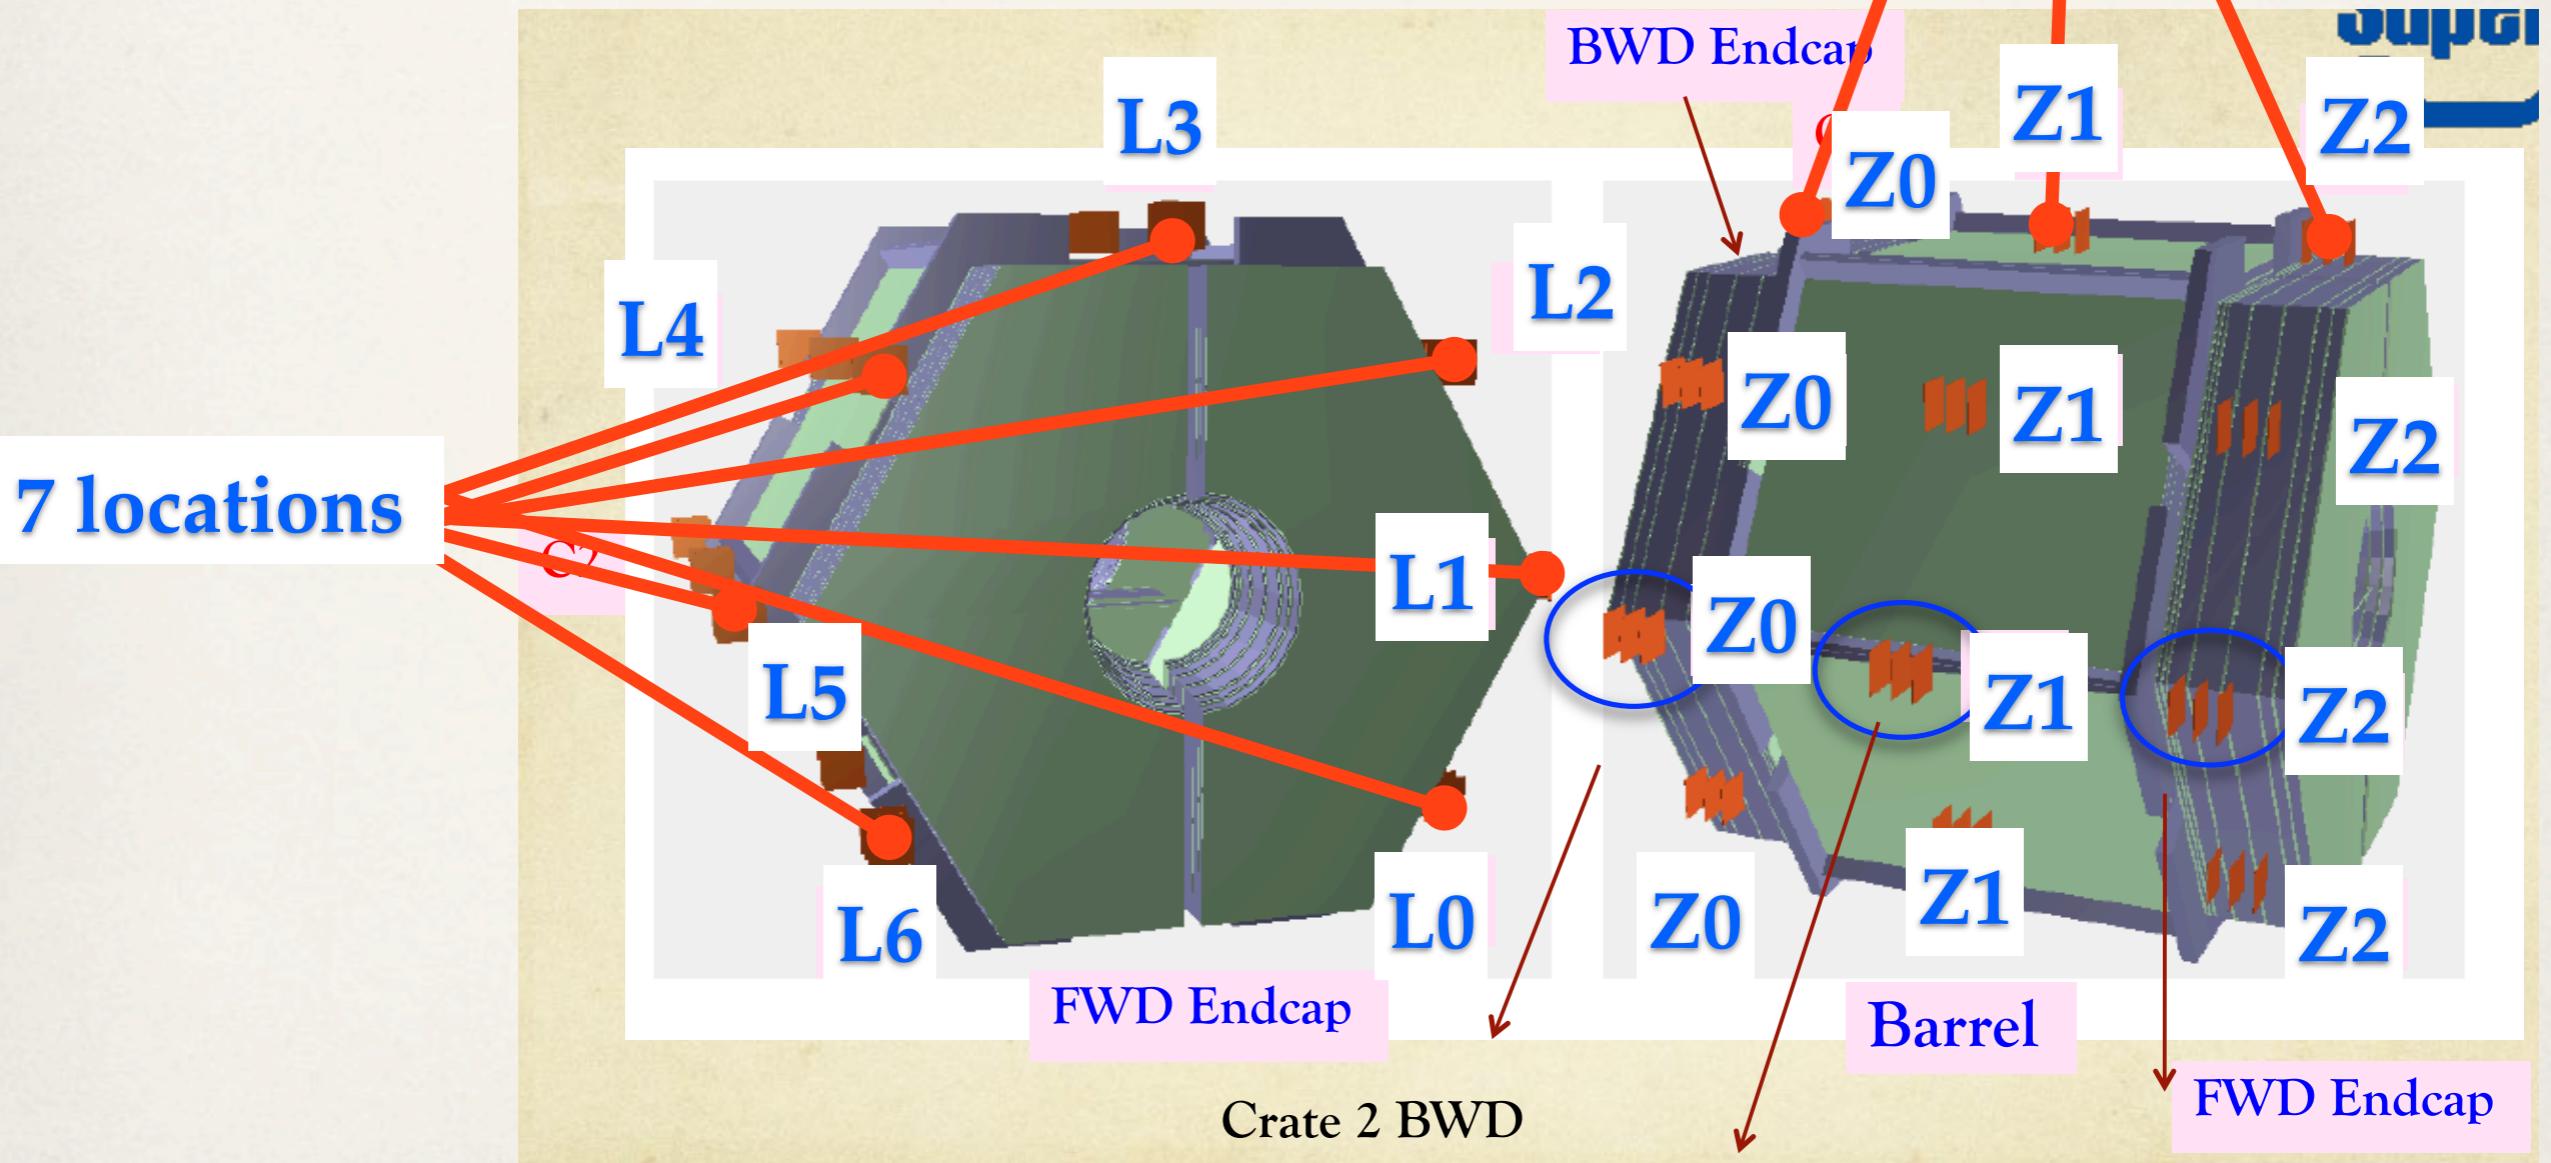

Simulated radiation level

Simulated radiation level

- IFR FEE: 21 locations
- Not integrated over Phi
