Dark Matter

Mirror Matter

Neutron - mirror
neutron
oscillation

Conclusions

Existence of invisible (dark) matter in the galaxies and in the Universe was hypothesized long time ago ... *(e.g. Zwicky applied Virial to Coma cluster and noted the deficit of mass ...)*

• Jan Oort 1932 • Fritz Zwicky 1933 • Vera Rubin 1970

That time, in principle, this dark matter could be more conservatively interpreted as invisible baryonic matter in the form of dim stars
... Zwicky also hypothesized, after discovery of the neutron, existence of neutron stars

Dark matter is everywhere in the Universe ...

Summary

Fisica
Astroparticellare

Dark Matter

Mirror Matter

Neutron - mirror
neutron
oscillation

Conclusions

Evidence for the existence of an dark matter in the Universe comes from several independent observations at different length scales ...
and now we are certain that that dark matter is not baryonic !
... but unfortunately we do not know who is dark matter !

Experimental Hints:

Summary

Fisica
Astroparticellare

Dark Matter

Mirror Matter

Neutron - mirror
neutron
oscillation

Conclusions

In the Standard Model $SU(3) \times SU(2) \times U(1)$ we do not have a candidate particle for dark matter ... *massive neutrino (~ 20 eV) was a natural “standard” candidate of dark matter (HDM) forming cosmological structures (Zeldovich’s Pancakes) – but it was excluded by astrophysical observations in 80’s – and later on by the neutrino physics itself*

In about the same period the BBN limits excluded dark matter in the form of invisible baryons (dim stars, etc.)

In 80’s a new *Strada Maestra* was opened – *SUSY*
– well-motivated theoretical concept promising to be a highway for solving a vast amount of fundamental problems, brought to a natural *almost “Standard”* candidate for dark matter – LSP or WIMP

** Another interesting candidate, Axion, emerged from Peccei-Quinn anomalous global $U(1)$ for solving strong CP problem: dark matter as a condensate of very light scalar bosons, $m \sim 10^{-4}$ eV*

Zurab Berezhiani

Summary

Fisica
Astroparticellare

Dark Matter

Mirror Matter

Neutron - mirror
neutron
oscillation

Conclusions

WIMP/LSP with mass $M_\chi \sim 100$ GeV – perfect candidate for CDM

$$\Omega_D h^2 \simeq \frac{0.02 x_f}{g_f^{1/2}} \left(\frac{1 \text{ pb}}{v \sigma_{\text{ann}}} \right) \quad v \sigma_{\text{ann}} \sim 1 \text{ pb} \rightarrow \Omega_D h^2 \sim 0.1$$

$$\text{WIMP Miracle: } v \sigma_{\text{ann}} \sim \frac{\pi \alpha^2}{M_S^2} \sim \left(\frac{100 \text{ GeV}}{M_\chi} \right)^2 \times 10^{-36} \text{ cm}^2$$

But for elastic scattering
 $X + N \rightarrow X + N$ one expects
 $\sigma_{\text{scat}} \sim \sigma_{\text{ann}}$
which is important for direct detection

However ... no evidence at
LHC and no evidence from
DM direct search + many
problems to natural SUSY

Dark Side of the Universe

Dark Matter

Mirror Matter

Neutron - mirror
neutron
oscillation

Conclusions

Today's Universe: flat $\Omega_{\text{tot}} \approx 1$ (*inflation*) and multi-component:

- $\Omega_B \simeq 0.05$ observable matter: **electron, proton, neutron**
- $\Omega_D \simeq 0.25$ dark matter: **WIMP? axion? sterile ν ? ...**
- $\Omega_\Lambda \simeq 0.70$ dark energy: **Λ -term? Quintessence?**

Matter – dark energy coincidence: $\Omega_M/\Omega_\Lambda \simeq 0.45$, ($\Omega_M = \Omega_D + \Omega_B$)
 $\rho_\Lambda \sim \text{Const.}$, $\rho_M \sim a^{-3}$; why $\rho_M/\rho_\Lambda \sim 1$ – just Today?

Anthropic explanation: if not *Today*, then *Yesterday* or *Tomorrow*.

Baryon and dark matter Fine Tuning: $\Omega_B/\Omega_D \simeq 0.2$
 $\rho_B \sim a^{-3}$, $\rho_D \sim a^{-3}$: why $\rho_B/\rho_D \sim 1$ - Yesterday Today & Tomorrow?

– How Baryogenesis could know about Dark Matter? popular models for primordial Baryogenesis (**GUT-B, Lepto-B, Affleck-Dine B, EW B ...**) have no relation to popular DM candidates (**Wimp, Wimpzilla, sterile ν , axion, gravitino ...**)

– Anthropic? Another Fine Tuning in Particle Physics and Cosmology?

Visible vs. Dark matter: $\Omega_D/\Omega_B \sim 1$?

Visible matter from Baryogenesis

B ($B - L$) & CP violation, Out-of-Equilibrium

$$\rho_B = n_B m_B, \quad m_B \simeq 1 \text{ GeV}, \quad \eta = n_B/n_\gamma \sim 10^{-9}$$

η is model dependent on several factors:

coupling constants and CP-phases, particle degrees of freedom, mass scales and out-of-equilibrium conditions, etc.

• Sakharov 1967

Dark matter: $\rho_D = n_X m_X$, but $m_X = ?$, $n_X = ?$

n_X is model dependent: DM particle mass and interaction strength (production and annihilation cross sections), freezing conditions, etc.

- Axion • $m_a \sim 10^{-5} \text{ eV}$ $n_a \sim 10^4 n_\gamma$ - CDM
- Neutrinos • $m_\nu \sim 10^{-1} \text{ eV}$ $n_\nu \sim n_\gamma$ - HDM (✗)
- Sterile ν' • $m_{\nu'} \sim 10 \text{ keV}$ $n_{\nu'} \sim 10^{-3} n_\nu$ - WDM
- Mirror baryons • $m_{B'} \simeq 1 \text{ GeV}$ $n_{B'} \sim n_B$ - ???
- WIMP • $m_X \sim 1 \text{ TeV}$ $n_X \sim 10^{-3} n_B$ - CDM
- WimpZilla • $m_X \sim 10^{14} \text{ GeV}$ $n_X \sim 10^{-14} n_B$ - CDM

Dark Matter

Mirror Matter

Neutron - mirror
neutron
oscillation

Conclusions

For observable particles *very complex physics !!*

Gauge $G = SU(3) \times SU(2) \times U(1)$ (+ SUSY ? GUT ? RH neutrinos ?)

photon, electron, nucleons (quarks), neutrinos, gluons, $W^\pm - Z$, Higgs ...

long range EM forces, confinement scale Λ_{QCD} , weak scale M_W

... matter vs. antimatter (B-conservation, C/CP ... Sakharov)

... existence of nuclei, atoms, molecules life.... Homo Sapiens !

What if dark matter comes from extra gauge sector ... which is as *complex* as the observable one?

Parallel gauge sector: – $G' = SU(3)' \times SU(2)' \times U(1)'$?

photon', electron', nucleons' (quarks'), $W' - Z'$, gluons' ?

... long range EM forces, confinement at Λ'_{QCD} , weak scale M'_W ?

... asymmetric dark matter (B'-conservation, C/CP ... Sakharov') ?

... existence of dark nuclei, atoms, molecules ... life ... twin Homo Sapiens?

Dark gauge sector ... similar to our particle sector? ... or exactly the same?

.... two (or more) parallel branes in extra dimensions? $E_8 \times E'_8$?

..... let us imagine !

“Imagination is more important than knowledge...” A. Einstein

Ordinary and Mirror Worlds

$$G \times G'$$

Regular world

Mirror world

- Two identical gauge factors, e.g. $SU(5) \times SU(5)'$, with identical field contents and Lagrangians: $\mathcal{L}_{\text{tot}} = \mathcal{L} + \mathcal{L}' + \mathcal{L}_{\text{mix}}$
- Exact parity $G \rightarrow G'$: Mirror matter is dark (for us), but its particle physics we know – **no new parameters!**
- Naturally in string theory: O & M matters localized on two parallel branes and gravity propagating in bulk: e.g. $E_8 \times E_8$

Mirror vs. ordinary matter

Windows to Dark
World (or
Anti-world ?)

Zurab Berezhiani

Summary

Fisica
Astroparticellare

Dark Matter

Mirror Matter

Neutron - mirror
neutron
oscillation

Conclusions

Particle physics will is described by a symmetric Lagrangian:

$$\mathcal{L}_{tot} = \mathcal{L} + \mathcal{L}' + \mathcal{L}_{mix}$$

- Invariant under two identical gauge groups: $G \times G'$
- Identical field contents
- Mirror Parity $P(G \leftrightarrow G')$ (no new parameters in \mathcal{L}')

Gravity *is not* the only common force between two sectors!

Other interactions are possible \mathcal{L}_{mix}

- Mirror Matter is a natural candidate for dark matter.
- If after Inflation $T' < T/2$ or so \rightarrow consistent with BBN

Mirror Particle Physics

Windows to Dark
World (or
Anti-world ?)

Zurab Berezhiani

Summary

Fisica
Astroparticellare

Dark Matter

Mirror Matter

Neutron - mirror
neutron
oscillation

Conclusions

For Ordinary particles we have the **Standard Model**:

- Gauge Symmetry: $G = SU(3) \times SU(2) \times U(1)$
- Particles: quarks, leptons, photon, gluons, W^\pm , Z , Higgs.
- Interactions: long-range EM forces, Strong interaction confinement (Λ_{QCD}), Weak scale M_W

In the Mirror Sector we have the same:

- Gauge Symmetry: $G' = SU(3)' \times SU(2)' \times U(1)'$
- Particles: quarks', leptons', photon', gluons', W' , Z' , Higgs'.
- Interactions: long-range EM forces, Strong interaction confinement (Λ'_{QCD}), Weak scale M'_W

$\mathcal{L}_{\text{mix}} \longrightarrow$ possible interactions (also $B - L$ violating as $\frac{1}{M} LHL'H'$)
as Lepton + Higgs \rightarrow Lepton' + Higgs' scattering: $\Delta L = 1$, $\Delta L' = 1$

O-M particle mixing (only for neutral particles)

$\nu - \nu'$ mixing, photon-photon' kinetic mixing, etc.

Mirror Matter Detection Modes

Windows to Dark
World (or
Anti-world ?)

Zurab Berezhiani

Summary

Fisica
Astroparticellare

Dark Matter

Mirror Matter

Neutron - mirror
neutron
oscillation

Conclusions

A candidate for self-interacting DM with mass $M_X \sim \text{few GeV}$

The lightest baryon' is stable (B-conservation) !

Asymmetric Dark Matter: Baryon' asymmetry of the Universe
(excess of baryons over antibaryons)

due to $B - L$ and CP violating processes out-of-equilibrium

E.g. $LH \rightarrow L'H'$ – Leptogenesis via scattering in Early Universe
or $UDD \rightarrow U'D'D'$ and cross reactions - Baryogenesis at low
scale

Neutral DM particles (mirror neutrinos, neutron, hydrogen atom)
can mix our neutral particles (ordinary neutrinos, neutron and
hydrogen atom)

Neutron – mirror neutron oscillation

Windows to Dark
World (or
Anti-world ?)

Zurab Berezhiani

Summary

Fisica
Astroparticellare

Dark Matter

Mirror Matter

Neutron - mirror
neutron
oscillation

Conclusions

The Mass Mixing $\epsilon(\bar{n}n' + \bar{n}'n)$ comes from a B and B' violating six-fermions effective operator: $\frac{1}{M^5}(udd)(u'd'd')$

M is the scale of new physics beyond EW scale.

$$m_n = m_{n'} \longrightarrow \tau_{nn'} \sim \epsilon^{-1} \sim (M/10\text{TeV})^5 \times 1\text{s}$$

All the experimental limits on this transition become invalid in the presence of a mirror magnetic field:

$$H = \begin{pmatrix} \mu_n \mathbf{B} \sigma & \epsilon + \mu_{nn'} (\mathbf{B} + \mathbf{B}') \sigma \\ \epsilon + \mu_{nn'} (\mathbf{B} + \mathbf{B}') \sigma & \mu_n \mathbf{B}' \sigma \end{pmatrix}$$

The probability of n-n' transition depends on the relative orientation of magnetic and mirror-magnetic fields. The latter can exist if mirror matter is captured by the Earth

Experimental Strategy

Zurab Berezhiani

Summary

Fisica
Astroparticellare

Dark Matter

Mirror Matter

Neutron - mirror
neutron
oscillation

Conclusions

We need to store neutron and to measure if the amount of the survived ones depends on the magnetic field applied.

- Fill the Trap with the UCN
- Close the valve
- Wait for T_S (75s, 150s, ...)
- Open the valve
- Count the survived Neutrons

Repeat this for different orientation and values of Magnetic field.

$$N_B(T_S) = N(0) \exp \left[- (\Gamma + R + \bar{P}_B \nu) T_S \right]$$

$$\frac{N_{B1}(T_S)}{N_{B2}(T_S)} = \exp \left[(\bar{P}_{B2} - \bar{P}_{B1}) \nu T_S \right]$$

So if we find that:

$$A(B, T_S) = \frac{N_B(T_S) - N_{-B}(T_S)}{N_B(T_S) + N_{-B}(T_S)} \neq 0 \quad E(B, b, T_S) = \frac{N_B(T_S)}{N_b(T_S)} - 1 \neq 0$$

A and E are expected to depend on magnetic field
