New Physics predictions

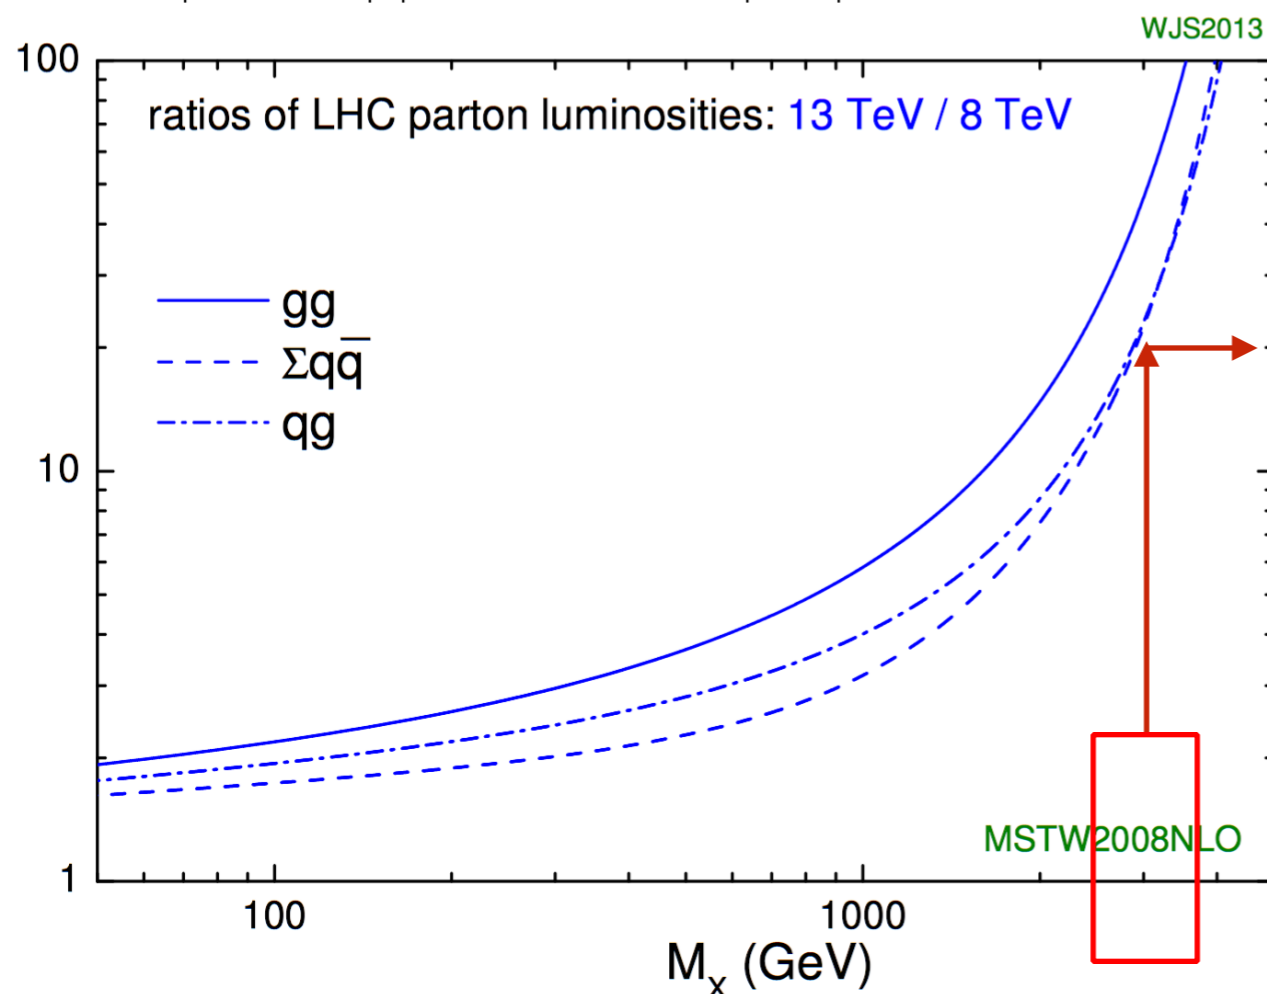

- The **Standard Model is a successful theory** full of experimental supports
- Confirmed also by the recent discovery of a **Higgs boson** with a mass of 125 GeV by ATLAS and CMS
- Some notable omissions of the SM: hierarchy problem, lack of a dark matter candidate, absence of gravity...
- Many **theories Beyond SM** developed
- **Common signature of many new Physics BSM is a new massive particle**
 - **Extra dimensions models:** solution of the hierarchy problem lowering the effective Planck scale by “diluting” gravity in additional dimensions
 - predict excitations of the gravitational field (spin-2 gravitons) separated by a characteristic mass scale
 - **GUT and Sequential Standard Model (SSM)**
 - predict new heavy gauge bosons.

Introduction

13 TeV data:

- unique chance to test new mass ranges
- for new bosons of $M=3$ TeV, same sensitivity of 8 TeV Run reached with $\sim 1\text{fb}^{-1}$

<http://www.hep.ph.ic.ac.uk/~wstirlin/plots/plots.html>

OUTLINE:

1. Search for new charged gauge bosons decaying in lepton + MET
2. Search for new neutral gauge bosons decaying in a lepton pair
3. Search for extra dimensional (RS models) models in di-photon

Very clean experimental signatures!

Strategy:

- Search for a localized excess in the di-photon/di-lepton/lepton+MET mass compatible with the production of a new resonance

Challenges:

- High signal efficiency while effectively removing reducible background
- Detector response at very high energy
- Reconstruction and identification specific for high-energy objects

$W' \rightarrow e/\mu + MET$

13 TeV

CMS EXO-15-006

Heavy gauge boson W' decaying into lepton+MET

Experimental signature:

- high-energy e ($p_T > 130$ GeV) + E_T^{miss}
- high-energy μ ($p_T > 53$ GeV) + E_T^{miss}

Strategy:

- lepton selection optimized for high-energy
- balanced decay for background suppression $0.4 < p_T/E_T^{miss} < 1.5$,
- $\Delta\Phi > 0.8\pi$ (back-to-back configuration)
- **lepton veto**: no other **electrons** (**muons**) with **$p_T > 35$ GeV** (**25 GeV**)
- W' (3 TeV) $A \cdot \epsilon$: 75% for both channels

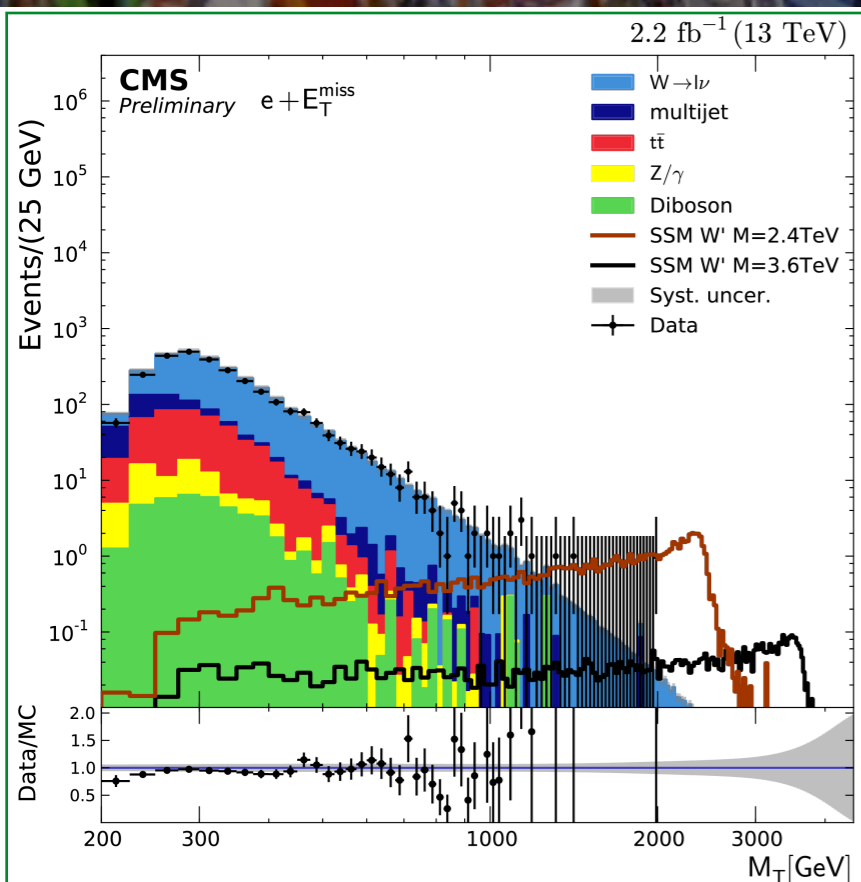

Background:

- main **irreducible** $W \rightarrow l\nu$; **reducible** $t\bar{t}$, Z/γ^* , dibosons (estimated from MC)
- **multijet** background for electron channel estimated from data

Highest mass events: at $M_T = 2$ TeV (electron channel) **1.3 TeV** (muon channel)

More details: talk A. Escalante

Good agreement between data and MC

$W' \rightarrow e/\mu + MET$

13 TeV

CMS EXO-15-006

2.2 fb⁻¹ (13 TeV)

Limits on the production cross section*BR for $M_T > 1$ TeV
(where Run-II data are more sensitive)

W'_{SSM} of masses less than 4.4 TeV are excluded

(tighter limits than Run1: W' excluded with a mass less than 3.28 TeV)

$W' \rightarrow \tau + MET$

8 TeV

CMS EXO-12-011

Heavy gauge boson W' decaying into hadronic tau + MET

Experimental signature:

- τ_h ($p_T > 100$ GeV) + $E_T^{miss} (> 140$ GeV)

Strategy:

- hadronic tau reconstruction optimized for high-energy
- balanced decay for background suppression $0.7 < p_T/E_T^{miss} < 1.5$,
- $\Delta\Phi > 2.4$ (back-to-back configuration)
- lepton veto: no other loose-ID and isolated leptons
- W' (3 TeV) $A \cdot \epsilon$: 42% * 16%

Background:

- main **irreducible** $W \rightarrow \tau_h \nu$; **reducible** $W \rightarrow e/\mu + \nu$, t production, Z/γ^* , dibosons (estimated from MC)
- QCD jet** background estimated from data

The W'_{SSM} is excluded for masses $0.3 < M_{W'} < 2.7$ TeV.

Limits on the W' as a function of the coupling parameter $\cot\theta_E$ for the Non Universal Gauge Interaction Model

Good agreement between data and MC

$Z' \rightarrow ee/\mu\mu$ (1/3)

13 TeV

CMS EXO-15-005

Heavy gauge boson (Z') decaying into a lepton pair

Experimental signature:

- high-energy electron pair ($p_T > 35 \text{ GeV}$)
- high-energy muon pair ($p_T > 53 \text{ GeV}$)

Strategy:

- specific high-energy lepton ID
- $Z' \rightarrow ee$
 - **2 categories:** Barrel-Barrel (**BB**) and Barrel-Endcap (**BE**)
 - $A^* \epsilon$ (1 TeV) = $75 \pm 8\%$ / $70 \pm 10\%$
 - mass resolution (1 TeV) = 1.4% / 1.8%
- $Z' \rightarrow \mu\mu$
 - $A^* \epsilon$ (1 TeV) = $89 \pm^{+11}_{-14}\%$
 - mass resolution (1 TeV) = 4%

Background:

- main **irreducible** Z/γ^* , **reducible** $t\bar{t}$, tW , dibosons (estimated from MC)
- **multijet** background $< 3\%$ (1%) of the total background for **dielectrons** (**dimuons**) $> 500 \text{ GeV}$ (estimated from data)
- MC background normalised at the Z peak

Good agreement between data and MC

$Z' \rightarrow ee/\mu\mu$ (2/3)

13 TeV

CMS EXO-15-005

2.6 fb⁻¹ (13 TeV, ee) + 2.8 fb⁻¹ (13 TeV, μμ)

Limits at 95% C.L. on the ratio of Z' cross section to Z/γ* cross section assuming a narrow resonance

- background model from simulation
- signal pdf: convolution of BW (input of 0%, 0.6% (Z'_ψ) or 3% (Z'_{SSM})) with a Gaussian

$Z' \rightarrow ee/\mu\mu$ (3/3)

13 TeV

CMS EXO-15-005

The limit exclude a Z'_{SSM} with a mass less than 3.15 TeV and Z'_{ψ} with a mass less than 2.6 TeV.

(8 TeV limits of 2.90 TeV (Z'_{SSM}) and 2.57 TeV (Z'_{ψ}) surpassed)

CMS Experiment at the LHC, CERN

Data recorded: 2015-Oct-30 19:23:54.631552 GMT

Run / Event / LS: 260424 / 211873064 / 115

13 TeV

CMS DP -2015/039

Highest mass events:

2.4 TeV for the muon channel

2.9 TeV in the electron channel (local **p-value** to observe at least one event in the range $m(ee) > 2.8$ TeV is **3.6%**)

CMS Experiment at the LHC, CERN

Data recorded: 2015-Aug-22 02:13:48.861952 GMT

Run / Event / LS: 254833 / 1268846022 / 846

$Z' \rightarrow \tau\tau$

8 TeV

CMS EXO-12-046

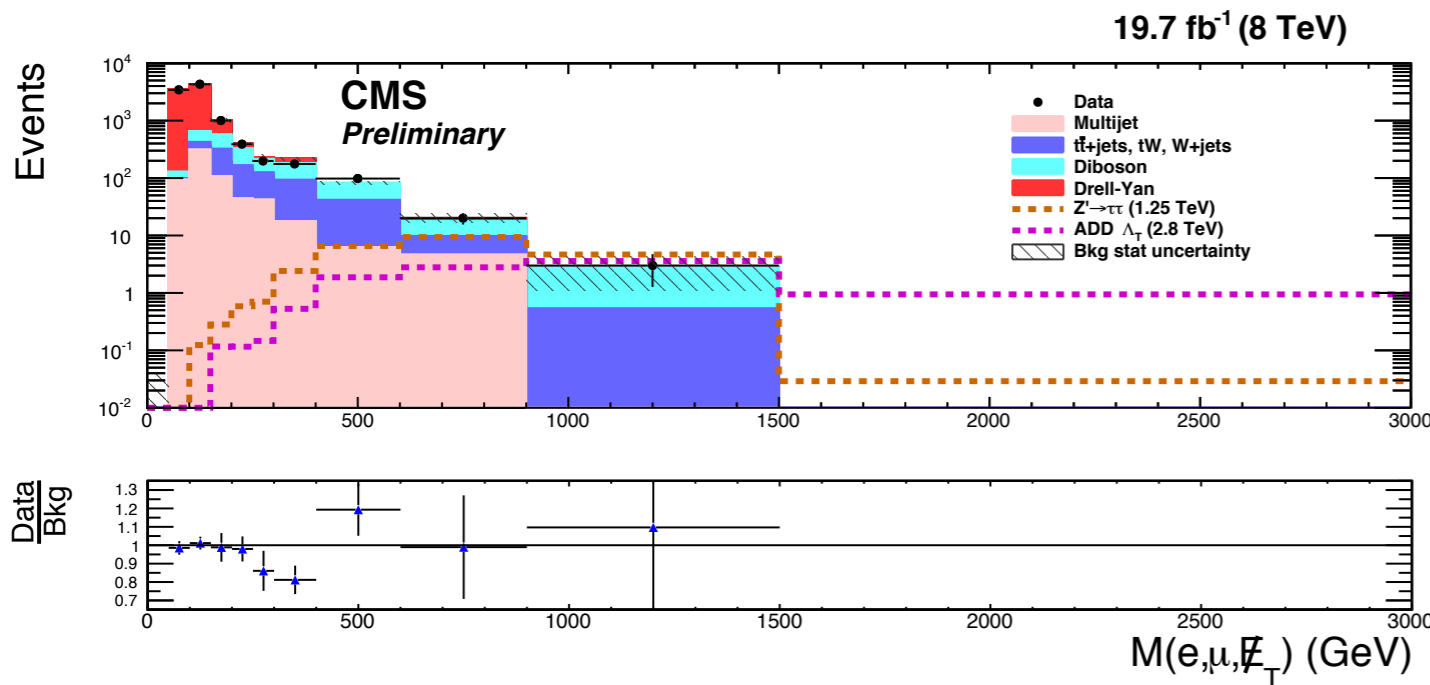

Heavy gauge boson (Z') decaying into a tau pair ($e\mu$ final state)

Experimental signature:

- electron ($E_t > 20$ GeV $|\eta| < 2.5$) + muon ($p_t > 20$ GeV $|\eta| < 2.1$)

Strategy:

- back-to-back (e, μ) ($\cos\Delta\Phi(e, \mu) < -0.95$)
- missing transverse momentum direction originating from tau decays
- no b-tagged jets
- $A^* \epsilon(1.25 \text{ TeV}) = 41 \pm 1\%$

Good agreement between data and MC

Background:

- main Z/γ^* at low mass, WW at high mass, **reducible**, tW , dibosons (estimated from MC)
- $t\bar{t}$ and **multijet** background (estimated from data)

The limit exclude a Z'_{SSM} with a mass less than 1.3 TeV and Z'_{ψ} with a mass less than 810 GeV.

Di-photon (1/3)

13 TeV

CMS EXO-15-004

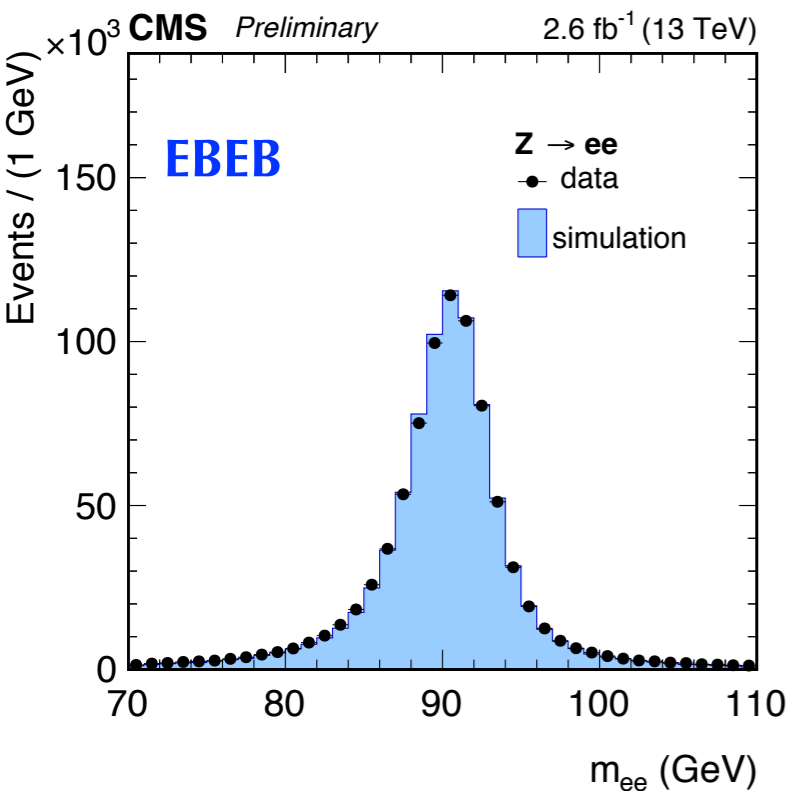

Search for RS graviton with 3 assumptions on coupling constant $\tilde{\kappa} = \kappa/m_{\text{Pl}}$: $\tilde{\kappa} = 0.01$ (narrow), $0.1, 0.2$ (wide)

Experimental signature: pair of photons ($p_T > 75$ GeV; $l_{\text{ch}} < 5$ GeV (in 0.3 cone around the photon direction))

Strategy:

- **2 categories:** (Barrel-Barrel) **EBEB** and (Barrel-Endcap) **EBEE**
- control region $m_{\gamma\gamma} > 230$ (**320**) GeV
- signal region $m_{\gamma\gamma} > 500$ GeV

- dedicated **photon ID** ($\epsilon = \sim 90\%$ per photon; ~ 10 (**20**)% of reducible background in the signal region)
- energy scale and resolution calibration using data-driven inputs ($Z \rightarrow ee$ events)

Di-photon (2/3)

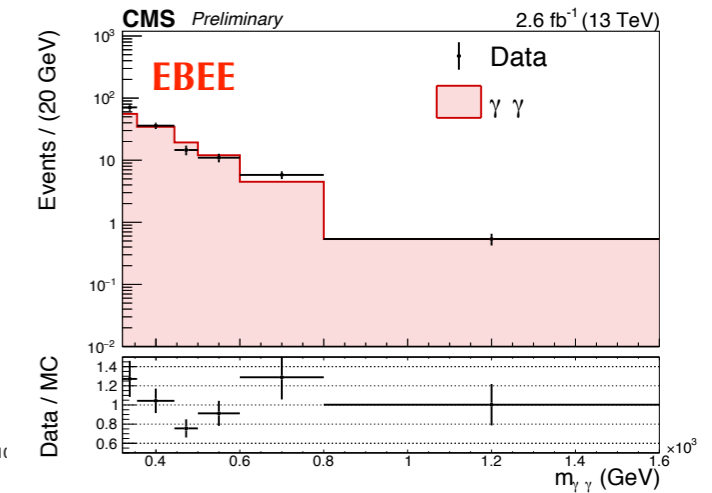

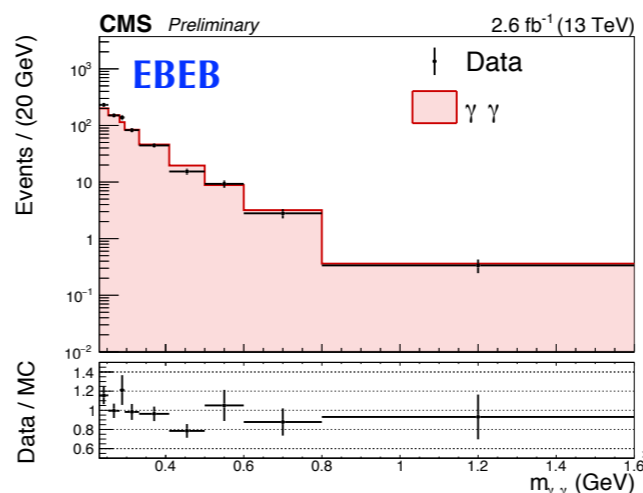

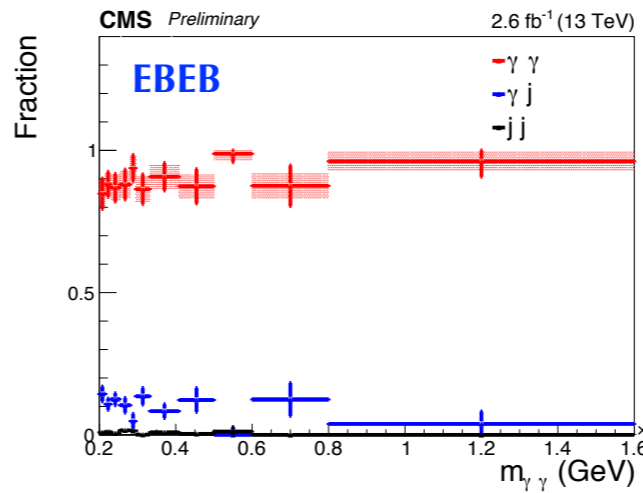

13 TeV

CMS EXO-15-004

Background:

- main **irreducible $\gamma\gamma$** direct production, **reducible γ -j** and **j-j**
- good agreement between data-driven estimation and estimations from MC
- **background model from parametric fit in data**

$$f(m_{\gamma\gamma}) = m_{\gamma\gamma}^{a+b \cdot \log(m_{\gamma\gamma})}$$

Di-photon (3/3)

13 TeV

$\tilde{\kappa} = 0.01$ (Narrow width)

$\tilde{\kappa} = 0.1$

$\tilde{\kappa} = 0.2$ (Wide width)

- RS graviton of mass below **1.3 TeV, 3.1, 3.8 TeV** excluded for $\tilde{\kappa} = 0.01, 0.1, \text{ and } 0.2$
- **Local p-value (760 GeV) $\sim 2.6\sigma$** (narrow width, excess of events in the BB)
- **Global p-value $\sim 1.2\sigma$**

CMS EXO-15-004

CMS Experiment at the LHC, CERN
Data recorded: 2015-Nov-02 21:34:00.662277 GMT
Run / Event / LS: 260627 / 854678036 / 477

13 TeV

Di-photon event with $m(\gamma\gamma) = 745 \text{ GeV}$

Di-photon 13 TeV + 8 TeV

CMS EXO-15-004

8 TeV + 13 TeV combination for narrow width model:

- ratio of the signal production cross section 8 TeV/13 TeV= 0.24 at 750 GeV
- exclusion limits obtained with the combined analysis improved by 20-30 % for $m_{\gamma\gamma} < 1.5$ TeV
- **Local p-value (750 GeV) $\sim 3\sigma$**
- **Global p-value $\sim 1.7\sigma$**

Conclusion

- CMS analyzed 13 TeV data searching for evidence of:
 - Heavy gauge bosons (W') in a muon/electron + MET
 - Heavy gauge bosons (Z') in a muon/electron pair
 - RS Graviton in a photon pair
 - 13TeV + 8 TeV results: largest excess has a local significance of $\sim 3\sigma$ (narrow resonance at $m_G = 750\text{GeV}$) and a global significance of 1.7σ
- No sign of new physics beyond the SM have been found (yet)
- Run-II analyses allowed to establish NEW tighter limits on BSM processes
