

# Experimental Results on Lifetimes, Width and Mass Differences from the Tevatron

Daniela Bauer  
for the CDF and DØ collaborations

**Imperial College**  
London

# Overview

- Introduction

CDF and DØ detectors

- The  $B_s$  system

$\Delta\Gamma$

$\Delta m_s$

flavour specific lifetime

- Lifetimes

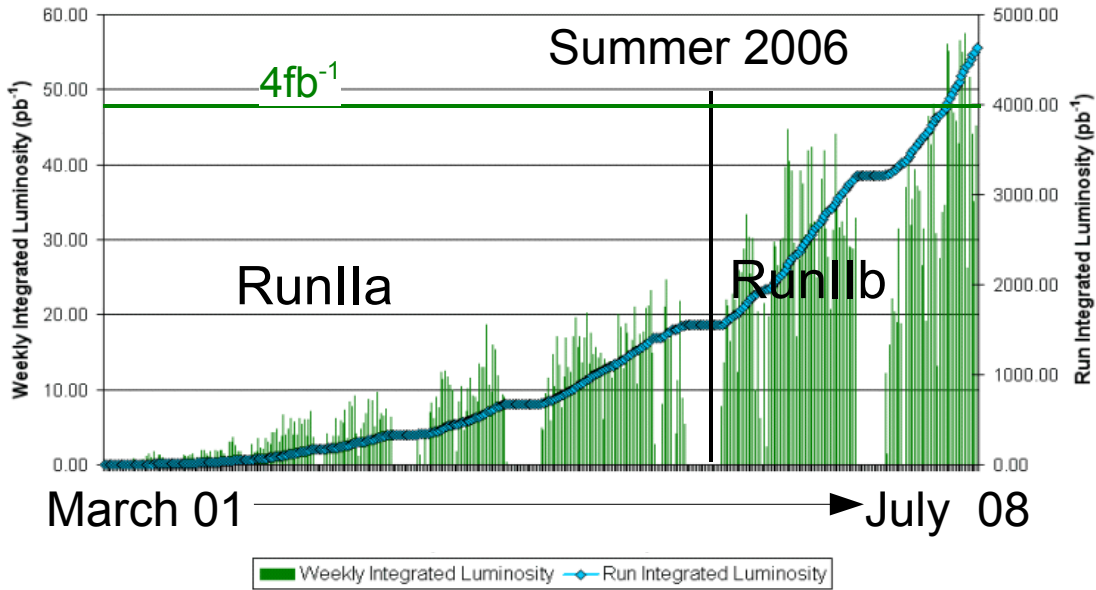

$\Lambda_b, B_c$

- Conclusions

# The Tevatron Collider at Fermilab

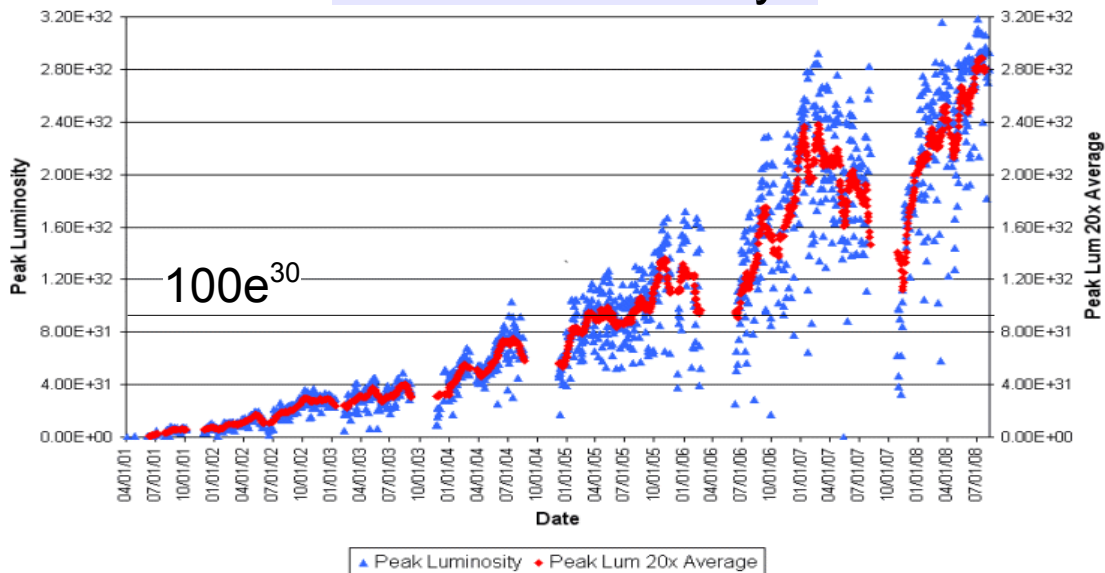

Run I 1992-1995  
 $E_{CM} = 1.8 \text{ TeV}$   
 $125 \text{ pb}^{-1}$

## Integrated Luminosity

**Run II**  
 $E_{CM} = 1.96 \text{ TeV}$   
 $4 \text{ fb}^{-1}$

## Peak luminosity

# The CDF detector

## *b*-physics:

- excellent momentum resolution and vertexing:
  - Silicon, Layer 00
  - large radius drift chamber
- $dE/dx$ : particle id
- Triggered muon coverage:  $|\eta| < 1$
- Triggers: dimuons, lepton + displaced track, *two displaced tracks*.

# The DØ Detector

## *b*-physics:

- Tracking: small radius, but coverage up to  $|\eta| < 2$
- Layer 0
- Triggered muon coverage up to  $|\eta| < 2$
- Triggers: dimuons, single muons, (track displacement at second trigger level)

# The $B_s^0$ System

# B<sub>s</sub> Mixing

Two flavour eigenstates:

$$\bar{B}_s^0 = |b \bar{s}\rangle$$

$$B_s^0 = |\bar{b} s\rangle$$

Mass eigenstates are an admixture of  $B_s^0$  flavour eigenstates:

$$\left| B_s^H \right\rangle = p \left| B_s^0 \right\rangle - q \left| \bar{B}_s^0 \right\rangle \quad \left| B_s^L \right\rangle = p \left| B_s^0 \right\rangle + q \left| \bar{B}_s^0 \right\rangle \quad \frac{q}{p} = \frac{V_{tb}^* V_{ts}}{V_{tb} V_{ts}^*}$$

Assuming no CP violation: mass eigenstate = CP eigenstate

$\Gamma_L \sim$  CP even (short lived),  $\Gamma_H \sim$  CP odd (long lived)

# $B_s$ Mixing

Time evolution of the eigenstates is described by

$$i \frac{d}{dt} \begin{pmatrix} B_s^0(t) \\ \bar{B}_s^0(t) \end{pmatrix} = \underbrace{\begin{bmatrix} M_0 & M_{12} \\ M_{12}^* & M_0 \end{bmatrix}}_{\text{mass matrix}} - \frac{i}{2} \underbrace{\begin{bmatrix} \Gamma_0 & \Gamma_{12} \\ \Gamma_{12}^* & \Gamma_0 \end{bmatrix}}_{\text{decay matrix}} \begin{pmatrix} B_s^0(t) \\ \bar{B}_s^0(t) \end{pmatrix}$$

Experimental observables describing the system:

$$\Delta m_s = m_H - m_L \sim 2|m_{12}|$$

Oscillations between  $B_s^0$  and  $\bar{B}_s^0$

$$\Delta \Gamma = \Gamma_L - \Gamma_H \sim 2 |\Gamma_{12}| \cos(\Phi_s)$$

Lifetime/width difference

$$\Phi_s = \arg(-M_{12}/\Gamma_{12})$$

CP phase ( $\rightarrow$  tomorrows session)

# Measuring $\Delta m_s$

$$\text{Prob}_{\text{osc}}^{\text{non-osc}}(x) \sim 1 \pm (1 - 2\eta) A \cos(\Delta m_s Kx/c)$$

true visible decay length

purity of flavour tag

Amplitude

- jet charge tagging:  
sign of  $b$ -quark  $\sim$  sign of momentum  
weighted sum of particles charges in jet
- lepton tagging:  
from semileptonic  $b$ -decays  
( $b \leftrightarrow l^-$ ,  $b\bar{b} \leftrightarrow l^+$ )
- same side tagging:  
charge of 'nearby' track correlated  
with  $b$ -quark flavour  
( $b \leftrightarrow K^-/\pi^+$ ,  $b\bar{b} \leftrightarrow K^+/\pi^-$ )

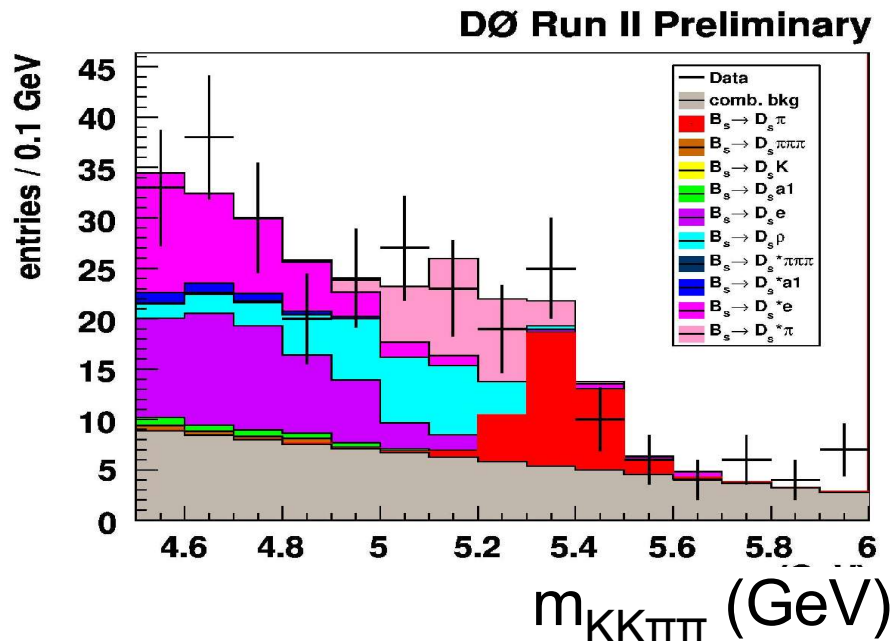

# $\Delta m_s$ at DØ

First two-sided limit  $17 < \Delta m_s < 21 \text{ ps}^{-1}$  at 90% CL ( $1 \text{ fb}^{-1}$ )

PRL 97, 021802 (2006)

## Updated measurement in 2008 ( $2.4 \text{ fb}^{-1}$ )

- Individual amplitude vs probe  $\Delta m_s$  for each channel
- RunIIa and RunIIb considered separately (Layer 0)
- Event-by-event scale factor to correct for impact parameter resolution
- Improved modeling of trigger effects & missing particles correction
- Hadronic modes included

## Data Sample

$B_s \rightarrow D_s \mu \nu X, D_s \rightarrow \Phi \pi$	44000
$B_s \rightarrow D_s \mu \nu X, D_s \rightarrow K^0 K$	18000
$B_s \rightarrow D_s \mu \nu X, D_s \rightarrow K_S K$	600
$B_s \rightarrow D_s^{(*)} e \nu X, D_s \rightarrow \Phi \pi$	1600
$B_s \rightarrow D_s \pi, D_s \rightarrow \Phi \pi$	200
<b>Total</b>	<b>64400</b>

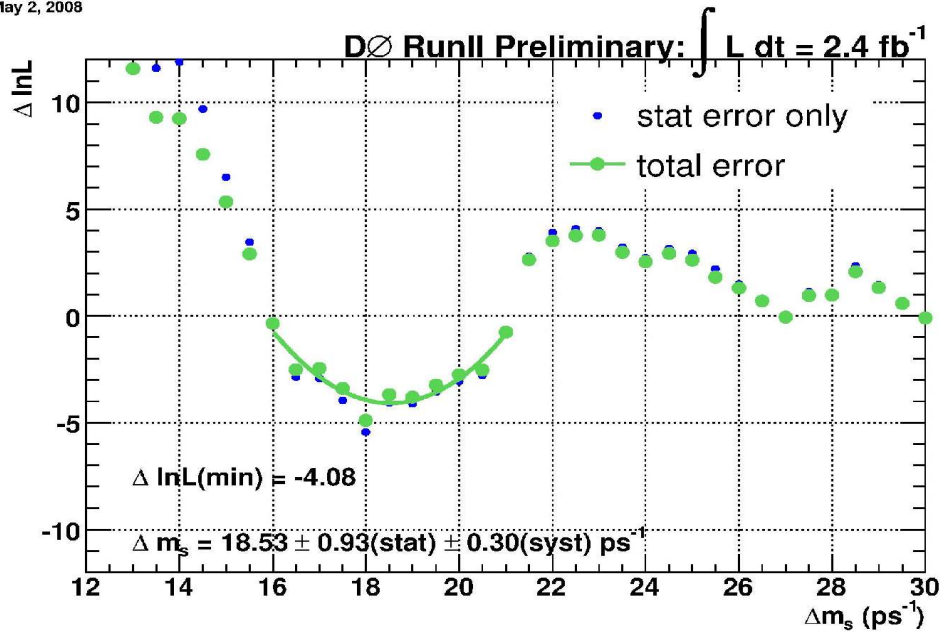

# $\Delta m_s$ at DØ

March 5, 2008

May 2, 2008

$$\Delta m_s = 18.53 \pm 0.93 (\text{stat}) \pm 0.30 (\text{sys}) \text{ ps}^{-1}$$

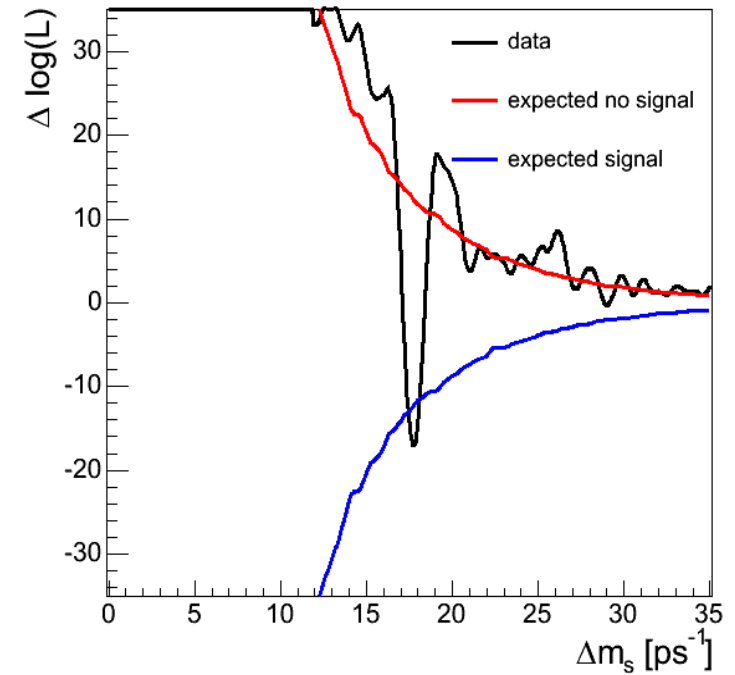

2.9  $\sigma$  significance (3.0  $\sigma$  statistical only)

# $\Delta m_s$ at CDF

2000 fully reconstructed decays  
3100 partially reconstructed decays

Phys. Rev. Lett. 97, 242003 (2006)

$$\Delta m_s = 17.77 \pm 0.10 \text{ (stat)} \pm 0.07 \text{ (syst)} \text{ ps}^{-1}$$

(5.4 $\sigma$  significance)

# Measuring $\Delta\Gamma$ in the decay $B_s \rightarrow J/\psi \Phi$

Pseudo-scalar  $\rightarrow$  Vector Vector

Different angular distributions for CP even and odd components

Simultaneous fit to mass, lifetime and angular distributions

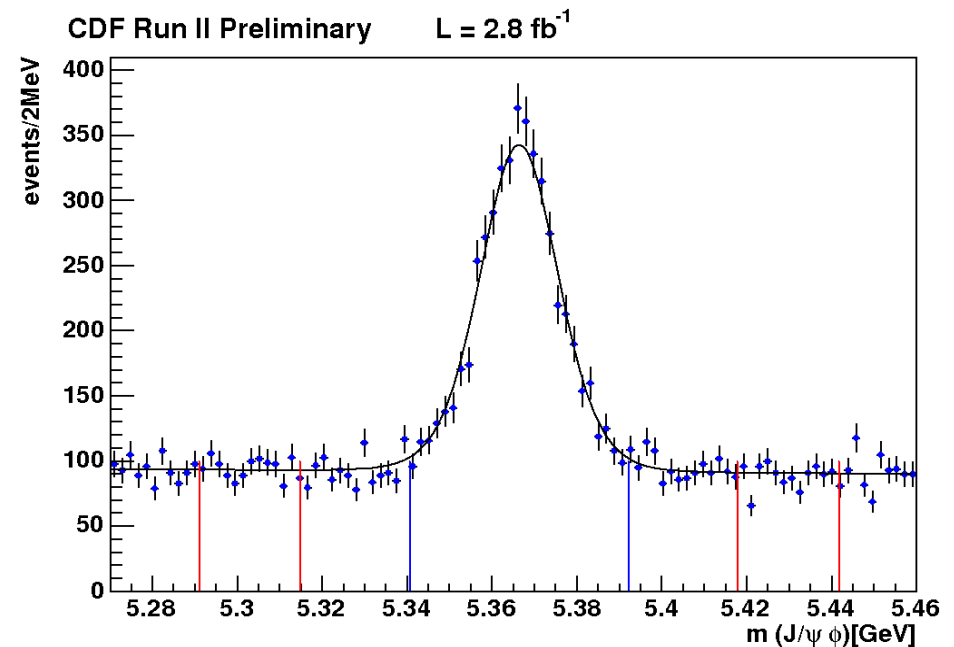

In  $J/\psi$  restframe:

$K^+K^-$  plane defines  $(x,y)$  plane

$K^+$  defines  $+y$  direction

$\Theta, \Psi$  polar and azimuthal angles of

$\Phi$  in  $\Phi$  restframe:  $\text{angle}(K^+, -J/\psi)$

# Measuring $\Delta\Gamma$ in the decay $B_s \rightarrow J/\psi \Phi$

Both experiments have now analysed  $2.8 \text{ fb}^{-1}$ .

Results below are for  $\Phi_s = \Phi_s^{\text{SM}}$

arXiv:0802.2255[hep-ex]

CDF Run II Preliminary  $2.8 \text{ fb}^{-1}$

$$\Delta\Gamma = 0.14 \pm 0.07 \pm 0.02 \text{ ps}^{-1}$$

$$\tau_s = 1.53 \pm 0.05 \pm 0.01 \text{ ps}$$

-- CP even (light)  
 -- CP odd (heavy)

$$\Delta\Gamma = 0.02 \pm 0.05 \pm 0.01 \text{ ps}^{-1}$$

$$\tau_s = 1.53 \pm 0.04 \pm 0.01 \text{ ps}$$

## A different approach to $\Delta\Gamma$

- $B_s \rightarrow D_s^{(*)} D_s^{(*)}$  ( $\sim$  CP even)

Neglecting small CP odd component:  $\Delta\Gamma/\Gamma = 2 BR(B_s \rightarrow D_s^{(*)} D_s^{(*)})$

CDF:  $BR(B_s \rightarrow D_s D_s)$  measured relative to  $B^0 \rightarrow D_s D^-$

0.36 fb<sup>-1</sup>:  $\Delta\Gamma/\Gamma \geq 2 BR(B_s \rightarrow D_s D_s) > 0.012$  at 95 % CL

DØ:  $BR(B_s \rightarrow D_s^{(*)} D_s^{(*)})$  measured relative to  $B_s \rightarrow D_s^{(*)} \mu\nu$

2.8 fb<sup>-1</sup>:  $\Delta\Gamma/\Gamma = 0.088 \pm 0.030$  (stat)  $\pm 0.036$  (sys)

- $B_s \rightarrow K^+ K^-$  (CP even)

CDF: Displaced track trigger and good mass resolution

Assuming flavour specific  $c\tau(B_s) = 1.454 \pm 0.040$  ps

$\Delta\Gamma/\Gamma = -0.08 \pm 0.23$  (stat)  $\pm 0.03$  (sys) using 0.36 fb<sup>-1</sup>

Update to  $> 2\text{fb}^{-1}$  in progress.

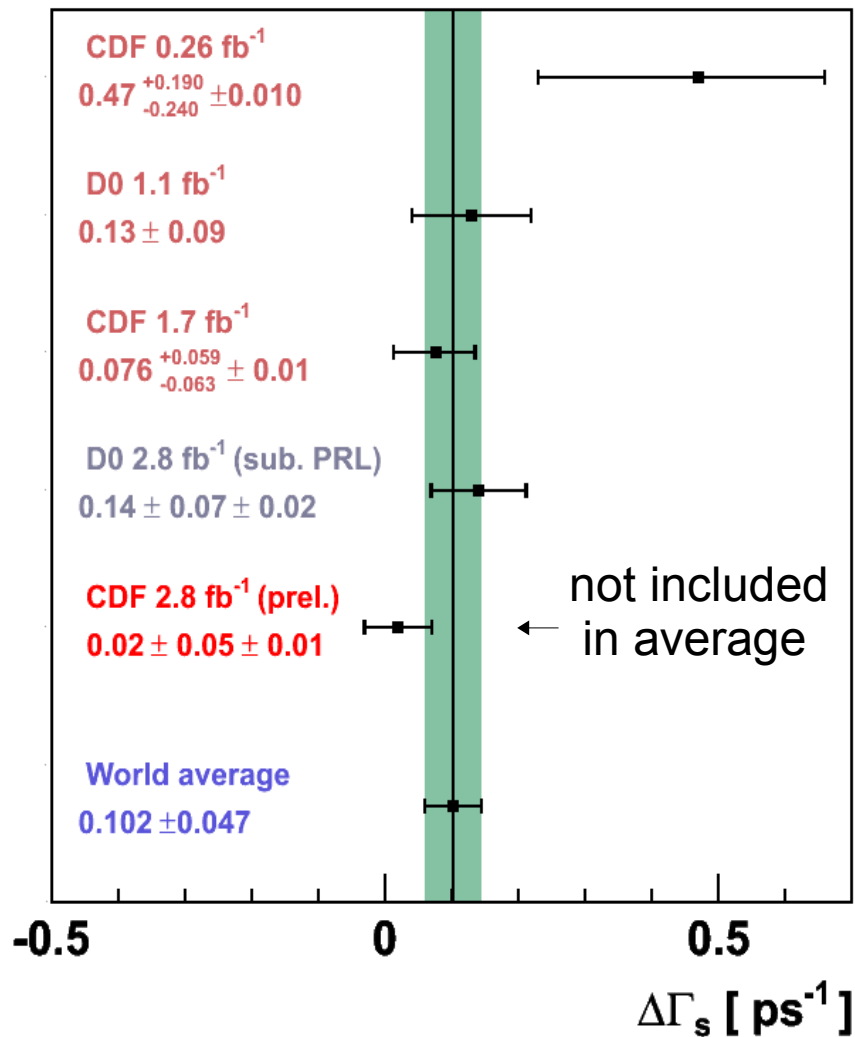

# $\Delta\Gamma_s$ Summary

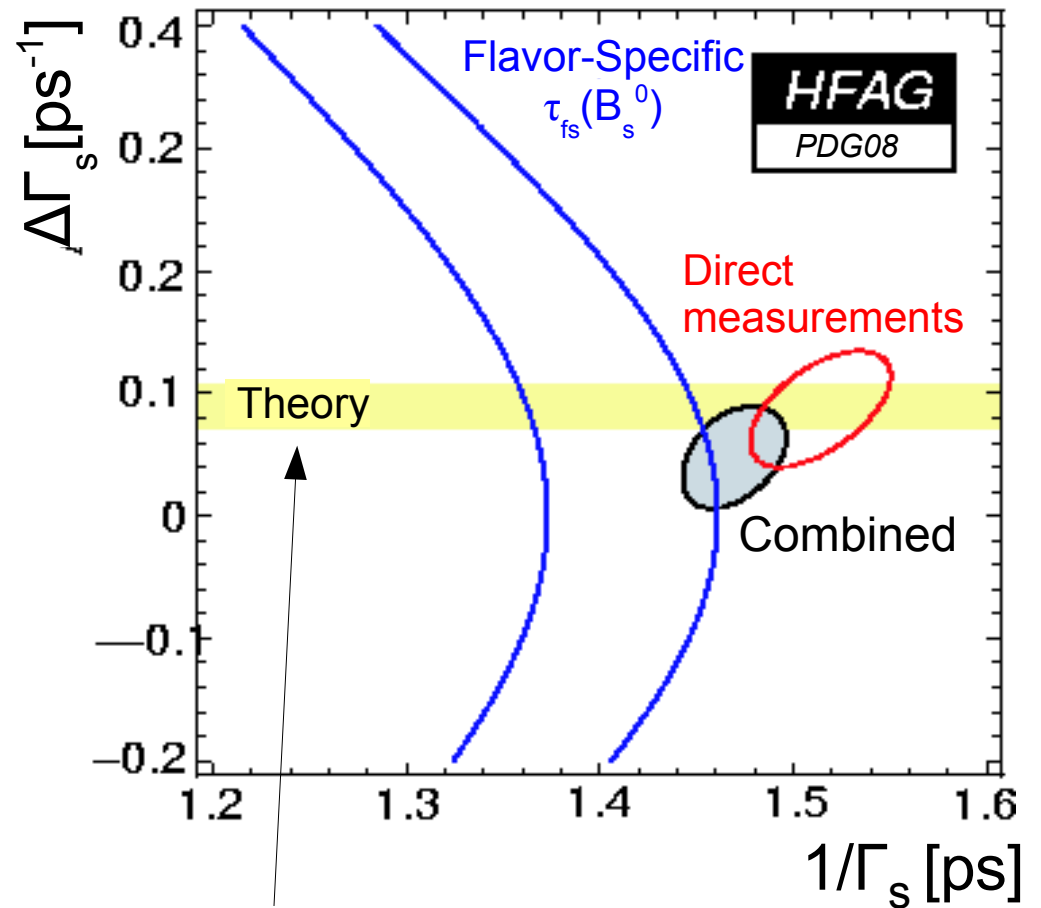

$$\Gamma_s = (\Gamma_L + \Gamma_H)/2 = 1/\tau_s$$

## $\Delta\Gamma_s$ Measurements

Contours of  $\Delta(\log L) = 0.5$

JHEP 06(2007) 072:  $\Delta\Gamma_s = 0.088 \pm 0.017$  ps<sup>-1</sup>

# $B_s^0$ lifetimes

$\Delta\Gamma \neq 0 \rightarrow$  specific measurements

- **Flavour specific lifetime**

Equal mix of  $B_s^H$  and  $B_s^L$  at  $t = 0$   
e.g. semileptonic decays

- **$CP$  specific lifetime**

Assumed to be either  $CP$  even or odd

$B_s \rightarrow D_s^+ D_s^-$  assumed to be  $CP$  even  $\rightarrow$  measures  $\Gamma_L$

- **Mixed  $CP$  states**

$B_s \rightarrow J/\psi \Phi$

# $B_s^0$ flavour specific lifetime

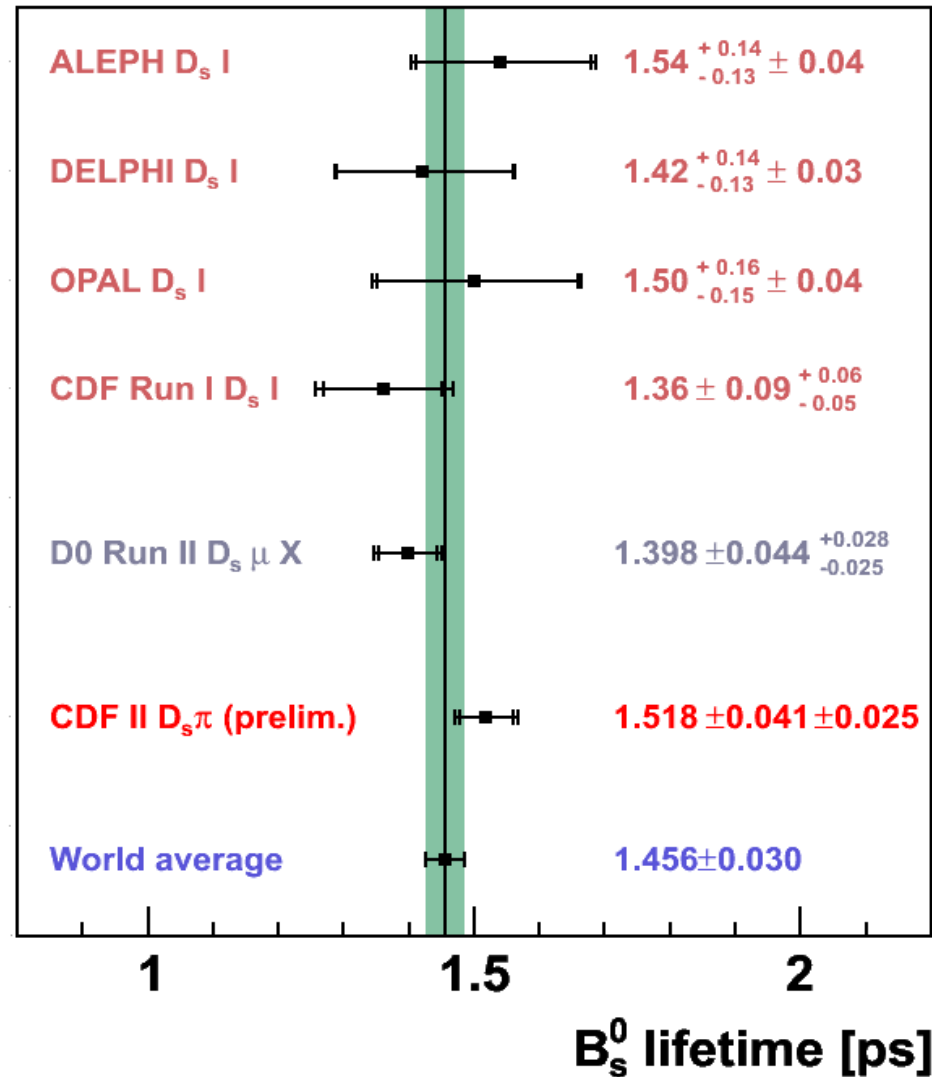

DØ:  $1.398 \pm 0.044^{+0.028}_{-0.025}$  ps  
 semilep, 0.4 fb  
 PRL 97, 241801 (2006)

CDF (new in 2008):  
 $1.518 \pm 0.041 \pm 0.025$   
 $B_s \rightarrow D_s (\Phi\pi) \pi X$

## $B_s^0$ Flavour Specific Lifetime

# B Hadron Lifetimes

$$\Gamma = \frac{G_F^2 m_b^5}{192 \pi^3} |V_{cb}|^2 \cdot \left[ A_0 + A_2 \left( \frac{\Lambda_{\text{QCD}}}{m_b} \right)^2 + A_3 \left( \frac{\Lambda_{\text{QCD}}}{m_b} \right)^3 \right]$$

## Spectator model

*b* hadron lifetimes are equal

## Pauli Interference

prolongs lifetimes (+3%  $\Lambda_b$ )

## Weak Annihilation and Exchange

reduces lifetime (-7%  $\Lambda_b$ )

# B Hadron Lifetimes

- The  $B^+$  and  $B^0$  lifetimes are precisely measured at  $B$ -factories.
- Tevatron gives access to  $B_s$ ,  $B_c$  and  $\Lambda_b$ .

Expected:  $\tau(B^+) \geq \tau(B^0) \approx \tau(B_s^0) > \tau(\Lambda_b) \gg \tau(B_c)$

Theoretical prediction for lifetime ratios:

$$\tau(B^+)/\tau(B^0) = 1.06 \pm 0.02$$

$$\tau(B_s)/\tau(B^0) = 1.00 \pm 0.01$$

$$\tau(\Lambda_b)/\tau(B^0) = 0.88 \pm 0.05$$

# The $B_c$ meson: A double heavy bound state

$B_c$  meson decays via weak decays of  $b$  or  $c$  quark or via weak annihilation  
→ considerably shorter lifetimes than light  $B$  mesons.

$B_c$  lifetime is measured in semileptonic decays ( $B_c \rightarrow J/\psi l \nu$ )  
(large branching fraction wrt hadronic channel)

$B_c$  mass measured in hadronic decays ( $B_c \rightarrow J/\psi \pi$ ), lifetime is used to reject background

# $B_c$ lifetime in semileptonic decays

measured variables:

$$\vec{d}_{xy} = \vec{x}_{\text{primary\_vertex}} - \vec{x}_{\text{secondary\_vertex}}$$

$$\vec{p}_T(J/\psi, l)$$

transverse decay length  $L_{xy} = (\vec{d}_{xy} * \vec{p}_T) / p_T^2 * m$

$$c\tau_{B_c} = m L_{xy} / p_T(B_c)$$

$B_c$  momentum cannot be fully reconstructed

→ correction factor (K) derived from Monte Carlo

pseudo(CDF)/visible(DØ) proper decay length

$$c\tau_{B_c} / K = m L_{xy}(J/\psi l) / p_T(J/\psi l)$$

# $B_c$ lifetime in semileptonic decays

$$c\tau_\mu = 179.1^{+32.6}_{-27.2} \text{ (stat) } \mu\text{m}$$

$$c\tau_e = 121.7^{+18.0}_{-16.3} \text{ (stat) } \mu\text{m}$$

Combined lifetime from  
likelihood scan of  $B_c$  lifetimes  
( $-2\text{Log}(L_e)-2\text{Log}(L_\mu)$ )

$$\tau(B_c) = 0.475^{+0.053}_{-0.049} \text{ (stat) } \pm 0.018 \text{ (sys) ps}$$

# $B_c$ lifetime in semileptonic decays

- Tri-muon invariant mass used to characterize each of the components contributing to  $J/\psi \mu$  sample.
- Use mass only fits to demonstrate signal, then simultaneous fit to mass and lifetime.

$$\tau(B_c) = 0.448^{+0.038}_{-0.036} \text{ (stat)} \pm 0.032 \text{ (sys) ps}$$

# $B_c$ Overview

Theoretical predictions\*: 0.48 – 0.55 ps

\*V.V. Kiselev airXiv:hep-ph/0308214

# $\Lambda_b$ lifetime

$\Lambda_b$  (udb)  
 $\Lambda_c$  (udc)  
 $\Lambda$  (uds)

DØ:  $\Lambda_b \rightarrow \Lambda_c \mu \nu X$   $1.3 \text{ fb}^{-1}$  (4437 decays)  $\tau(\Lambda_b) = 1.290^{+0.119}_{-0.110} \text{ (stat)}^{+0.087}_{-0.091} \text{ (sys)} \text{ ps}$   
 $\Lambda_b \rightarrow \Lambda J/\psi$   $1.2 \text{ fb}^{-1}$  (171 decays)  $\tau(\Lambda_b) = 1.218^{+0.130}_{-0.115} \text{ (stat)} \pm 0.042 \text{ (sys)} \text{ ps}$

CDF:  $\Lambda_b \rightarrow \Lambda J/\psi$   $1.0 \text{ fb}^{-1}$  (557 decays)  $\tau(\Lambda_b) = 1.580 \pm 0.077 \text{ (stat)} \pm 0.012 \text{ (sys)} \text{ ps}$   
 $\Lambda_b \rightarrow \Lambda_c \pi$   $1.0 \text{ fb}^{-1}$  (2904 decays)  $\tau(\Lambda_b) = 1.410 \pm 0.046 \text{ (stat)} \pm 0.029 \text{ (sys)} \text{ ps}$

# $\Lambda_b$ lifetime

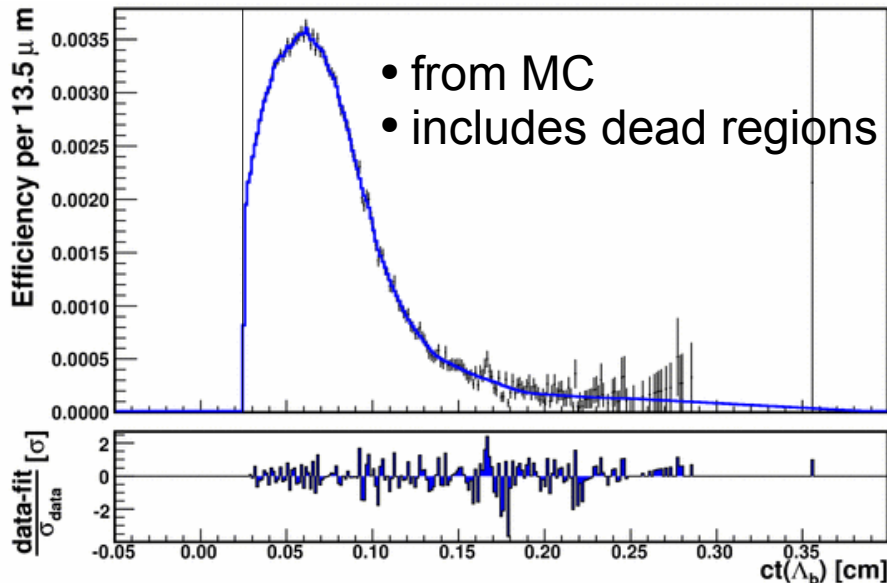

Most recent update:

CDF:  $\Lambda_b \rightarrow \Lambda_c (\rightarrow p K \pi) \pi$  using a displaced track trigger

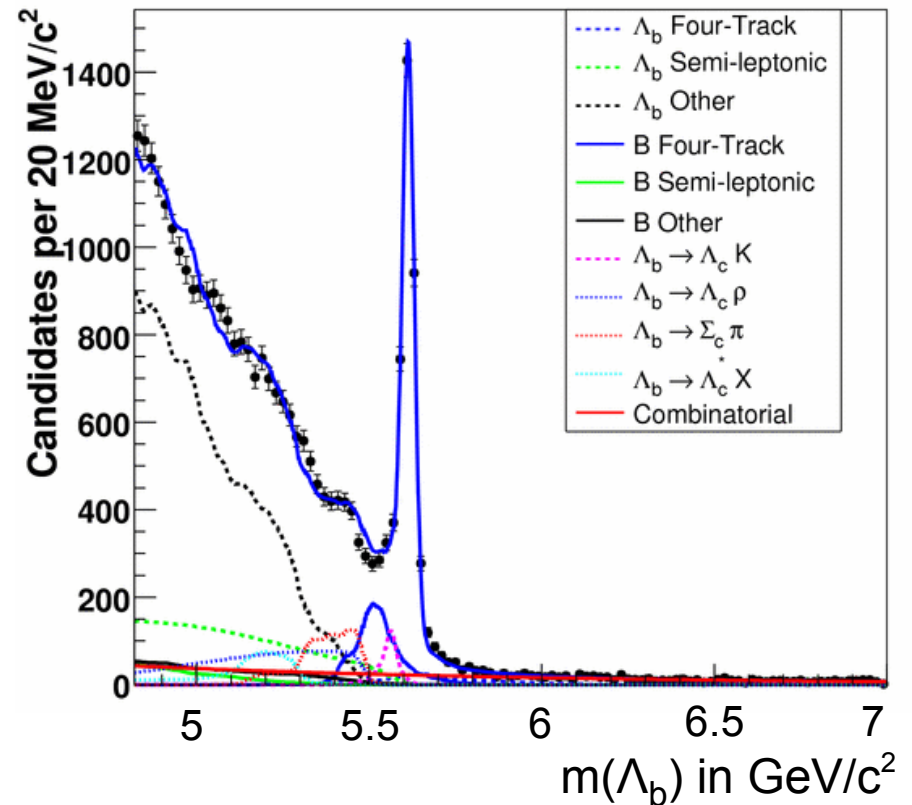

- Two step fit: mass, lifetime for signal region only
- Trigger efficiency from MC
- Using current world average for  $B^0$  lifetime:  $\tau(\Lambda_b)/\tau(B^0) = 0.922 \pm 0.039$

## Efficiency Two Track Trigger

0.025 cm

CDF II Preliminary,  $L = 1.1 \text{ fb}^{-1}$

# $\Lambda_b$ lifetime 2008

## $\Lambda_b$ Lifetime 2008

# Conclusions

Reviewed **recent** Tevatron measurements of the  $B_s$  system and  $b$ -hadron lifetimes.

The Tevatron experiments continue to produce precision heavy flavour measurements that are complementary to and competitive with the  $b$ -factories.

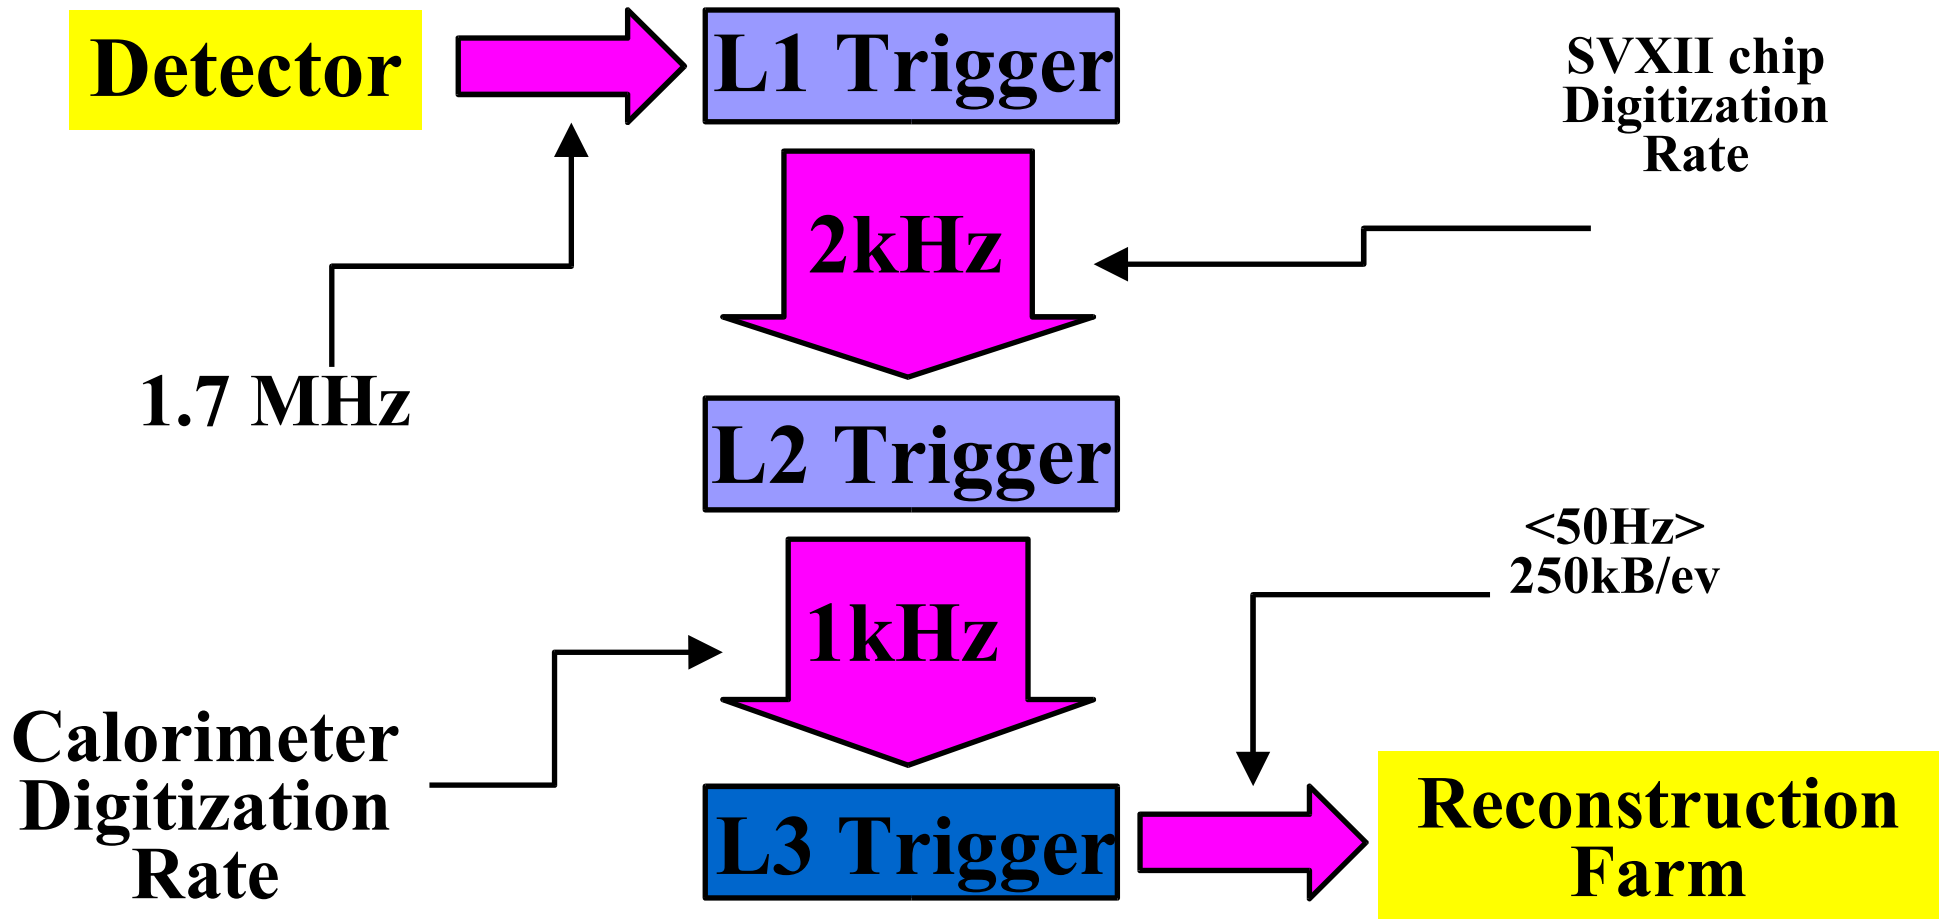

With ongoing data taking and a doubling of the data set further improvements to be expected before the LHC takes over.

**Backup slides**

# $B_c$ mass

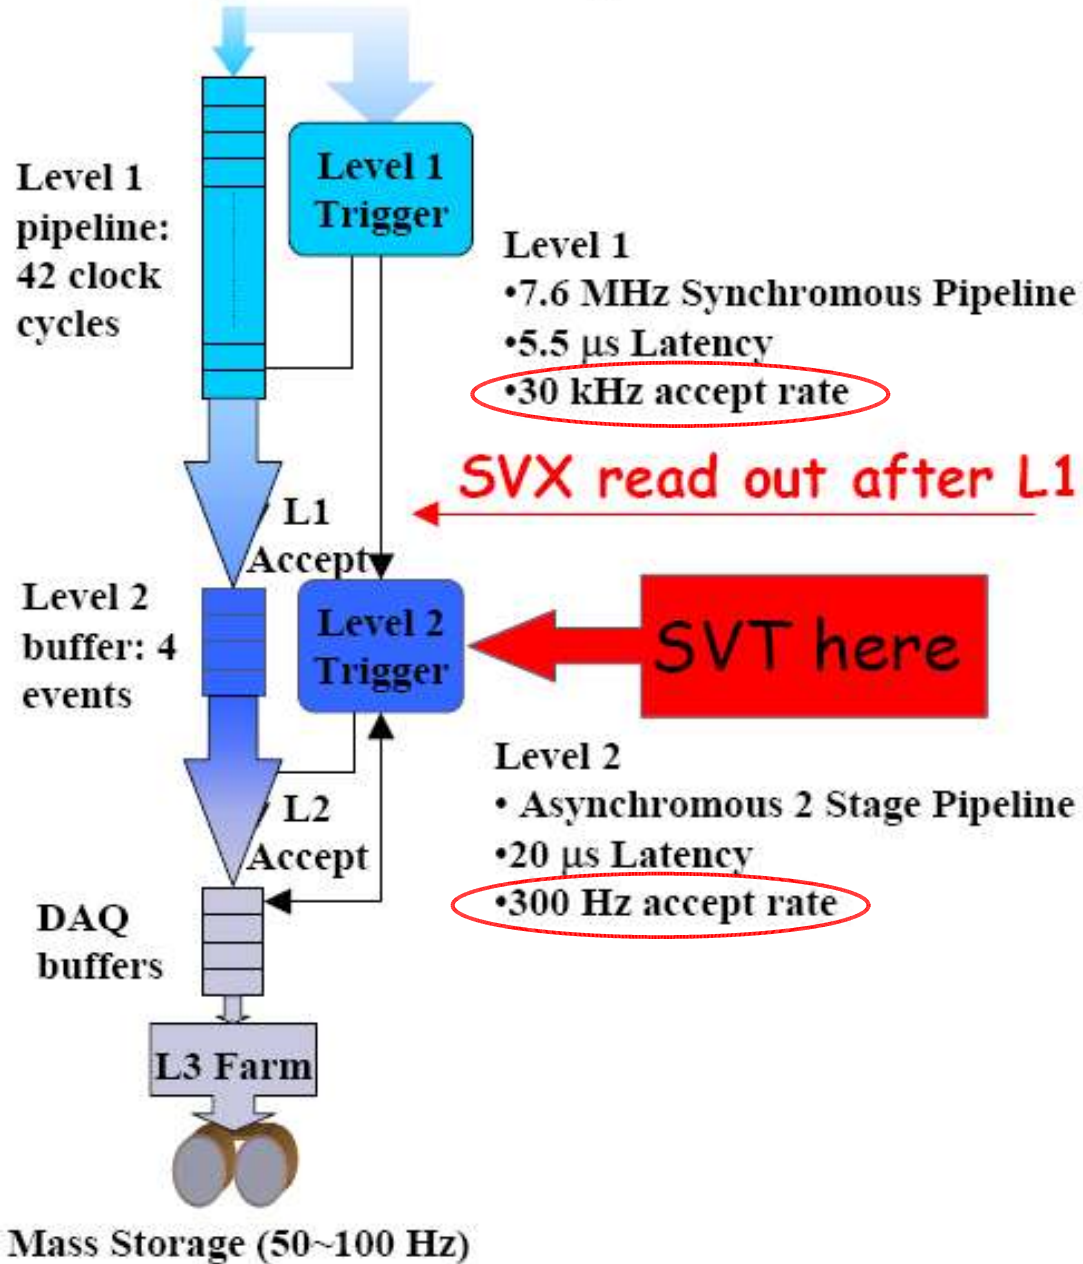

# DØ Trigger System

# CDF Trigger System

Raw data, 7.6 MHz Crossing rate

# Muon system

## Main features:

- 3 layers of drift tubes.
- 3 layers of scintillators: triggering, improved resolution in wire direction, rejection of cosmic
- Toroid magnet (1.8 T) after the first layer: local  $p_T$  measurement (trigger).
- Toroid and solenoid polarities reversed on regular basis.
- Track matched muons up to  $|\eta| < 2.2$

# Silicon Track Trigger

- L1 CTT tracks are used to define roads into the SMT.
- SMT hits are clustered in these roads.
- Track is refit within the road.

→ Improved  $p_T$  measurement wrt L1.  
→ Impact parameter measurement.

## Under-used by *b*-physics in RunIIa:

- Impact parameter bias difficult to model/analyze.
- (Planned) late commissioning: Triggers already well established with sufficient rate reduction.
- No displaced track only trigger due to L1 bandwidth limitations.

RunIIb: *b*-physics and Higgs group are the main users of the STT.

# Trigger System: Level 3

- Software based.
- Goal: To perform a (partial) reconstruction of the event.

## Tools of the trade:

- ★ muons
- ★ electrons
- ★ tracking
- ★ taus
- ★ jets
- ★ missing  $E_T$
- ★ primary & secondary vertexing
- ★ isolation (muons, electrons)
- ★ impact parameter (tracks, muons)
- ★ invariant mass

... and almost any combination thereof
