Angular distribution of coherent Cherenkov radiation from a tilted bunch passing through a slit in target

Friday, 30 September 2016 15:15 (15 minutes)

We considered coherent Cherenkov radiation (CChR) produced by a tilted bunch passing through a slit in a dielectric slab. For a chosen dielectric susceptibility $\varepsilon=1.3$ the resulting CChR propagates from a target bulk to vacuum at the angle $\theta_{ch}=32.6^\circ$. The azimuthal asymmetry in CChR angular distribution was calculated and shown that difference of yields for azimuthal angles $\varphi=0^\circ$ and $\varphi=180^\circ$ is enhanced two orders of magnitude. The maximal CChR intensity yield at the angle $\theta_{ch}$ is achieved for the same value of the bunch tilt angle.
