The empirical grounds of SN-GRB connection

Thursday, 20 October 2016 12:45 (25 minutes)

I will review the status of the SN-GRB connection. Present data suggest that SNe associated with GRBs form a heterogeneous class of objects including both bright and faint Hypernovae. Finally I'll discuss the empirical estimate of the ratio GRB/SNe-Ibc, to be in the range $\sim 0.4\%$ - 3% .
