

University of Zurich

# Searching for Dark Matter at the LHC

Annapaola de Cosa (University of Zurich)

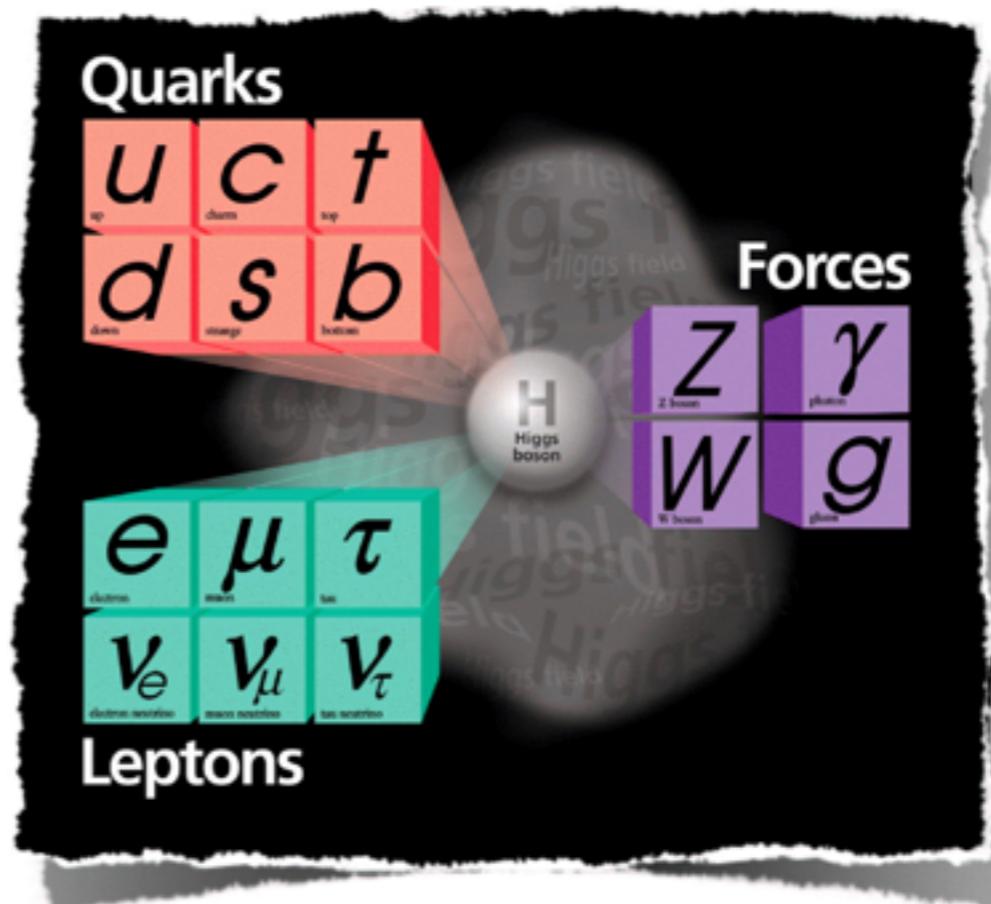

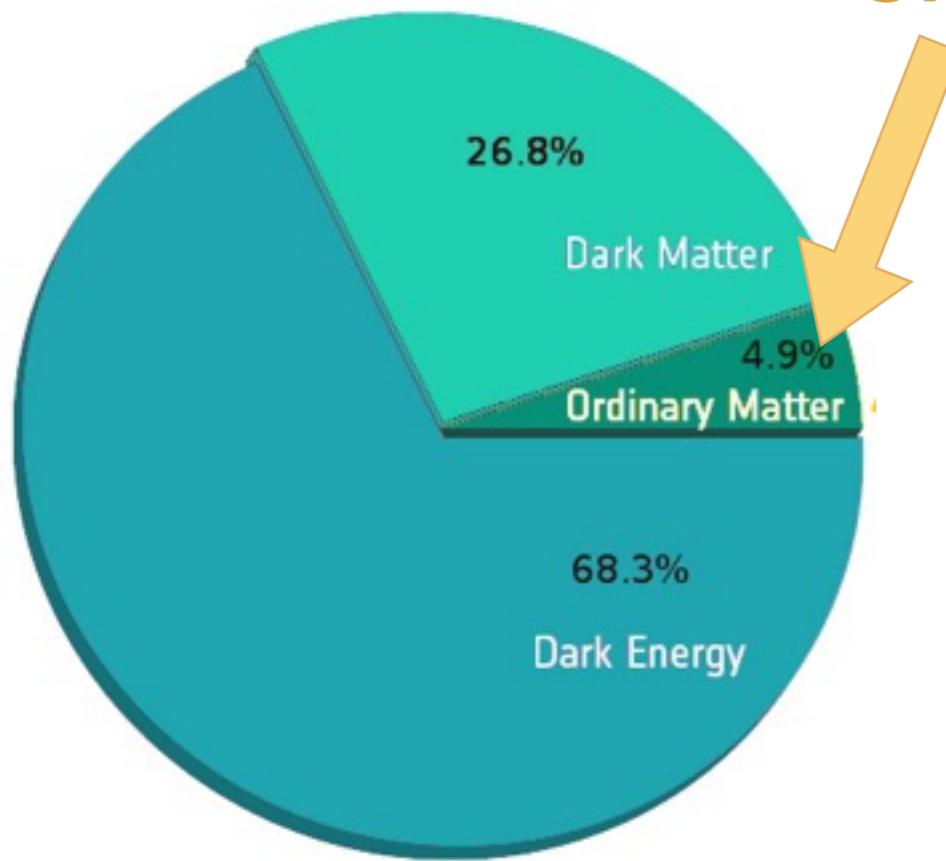

May 2<sup>nd</sup> 2016

Università degli Studi di Napoli, “Federico II”

# Going beyond the Standard Model

- ▶ Great success of the Standard Model of particle physics in the last decades
  - Accurate description of elementary particles and their interactions
- ▶ 2012: Discovery of the Higgs boson
  - Last piece of the SM puzzle now in place

SM ~ 5%

**But...What about Dark Matter?**

- ▶ Compelling proof of DM existence from astrophysical measurements
- ▶ SM does not predict DM
- ▶ Strong evidence for new physics

# First Hints of Dark Matter: 30s

**1933:** Zwicky measured galaxies velocity in the Coma Cluster

Virial Theorem:  $2K = -U$

where:

$$k = \frac{1}{2} M \langle v \rangle^2 \quad U = \frac{G M}{R}$$

Excess in direct mass measurement observed wrt luminosity-based measurements:  $M \sim 10 M_L$

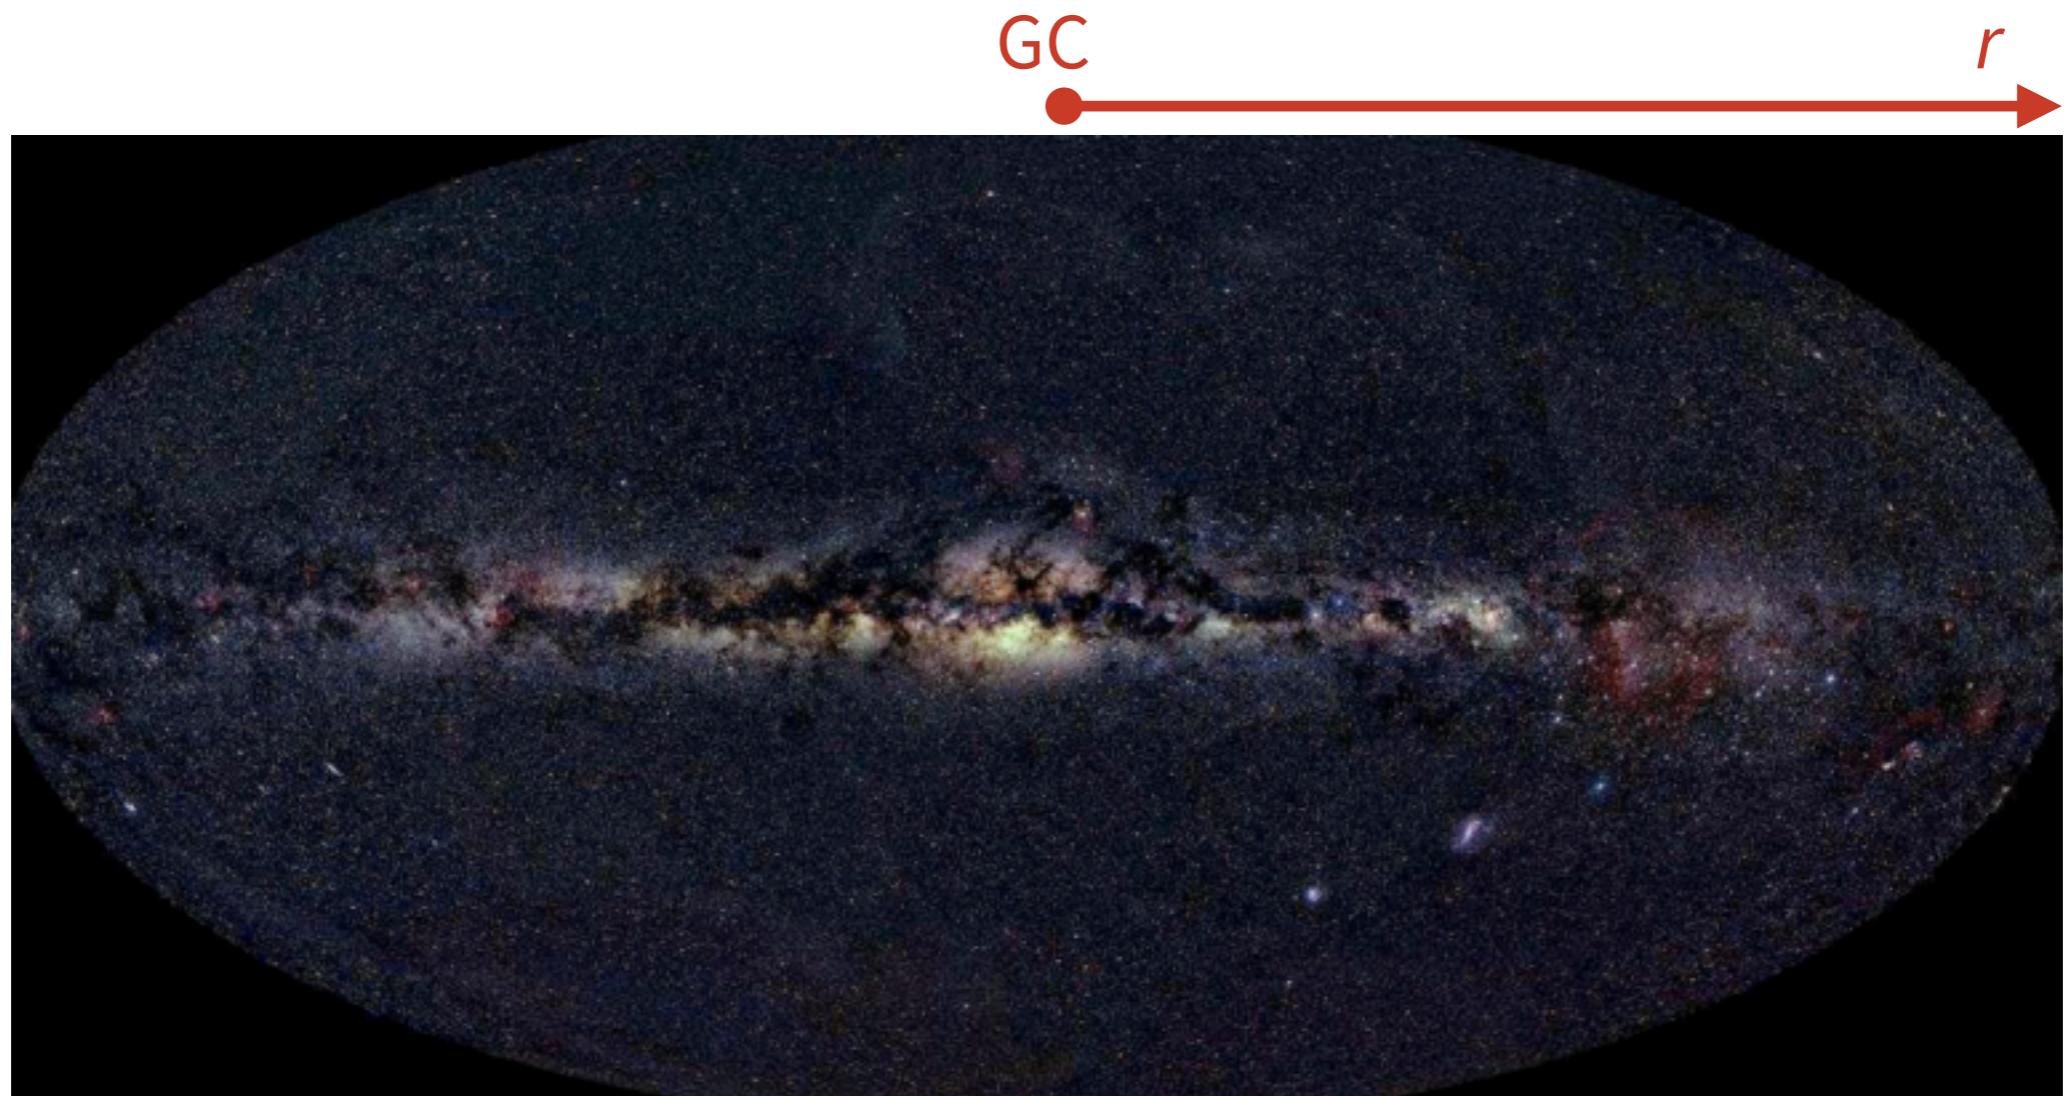

**Bulk of matter is DARK**

# First hints of Dark Matter: 70s/80s

**Galactic Rotation Curve:** Starts and gas movement within a galaxy depends on the distance  $r$  to the Galactic Centre (GC)

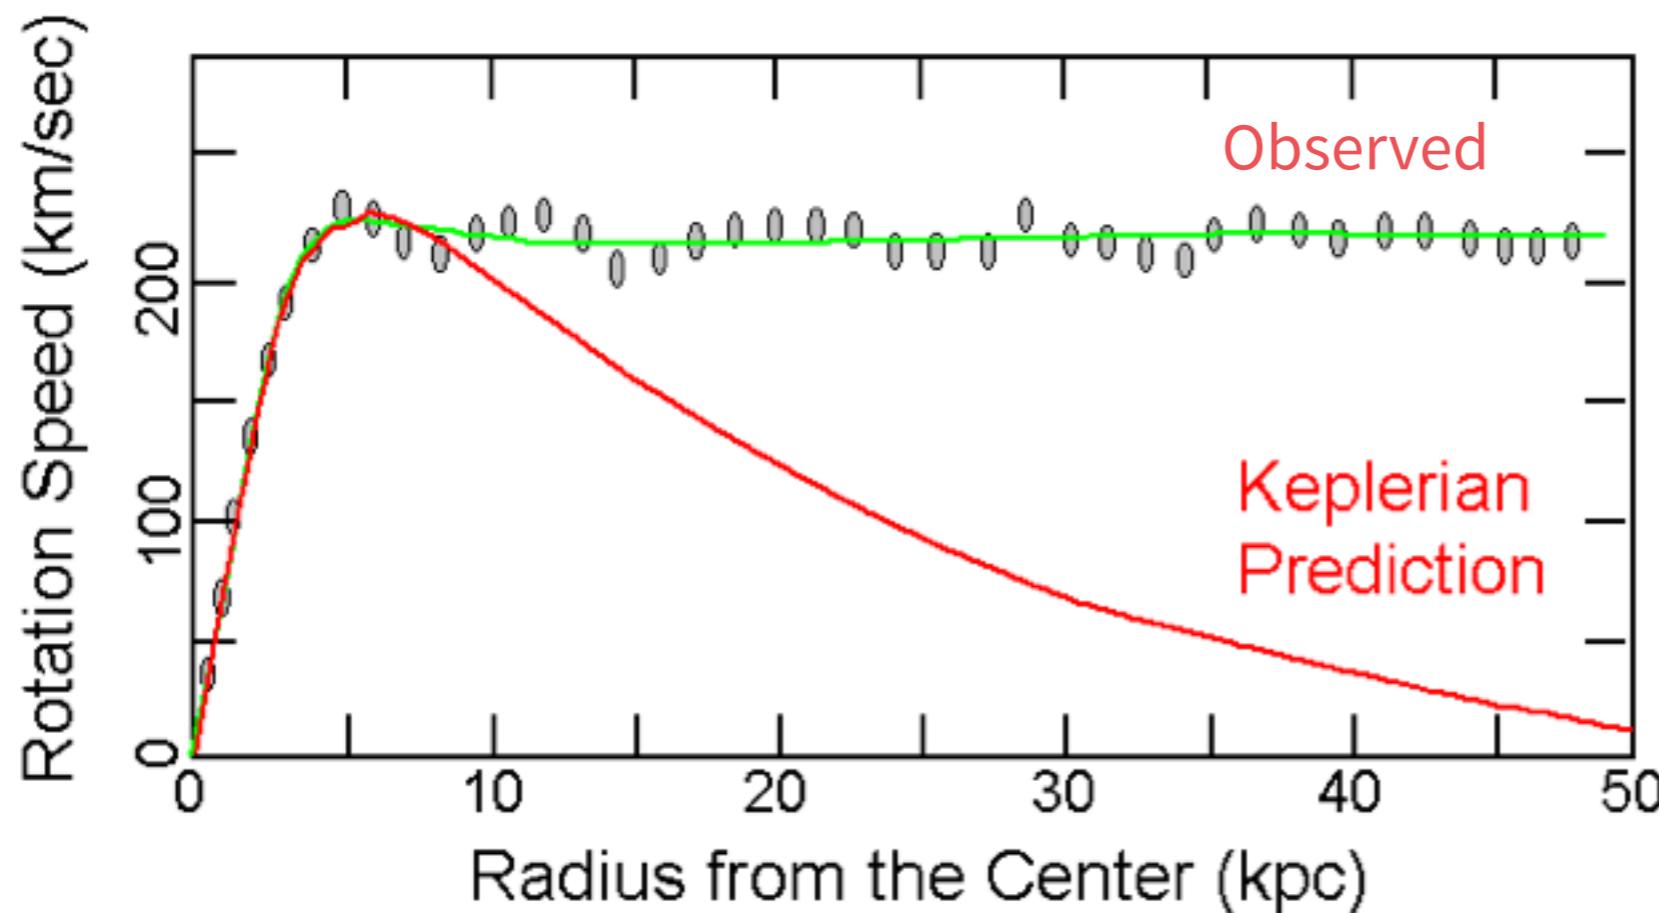

Expected behaviour:  $v_r(r) \propto 1/\sqrt{r}$

# First hints of Dark Matter: 70s/80s

**Galactic Rotation Curve:** Starts and gas movement within a galaxy depends on the distance  $r$  to the Galactic Centre (GC)

Observed behaviour:  $v_r(r \geq R_0) \sim \text{const}$

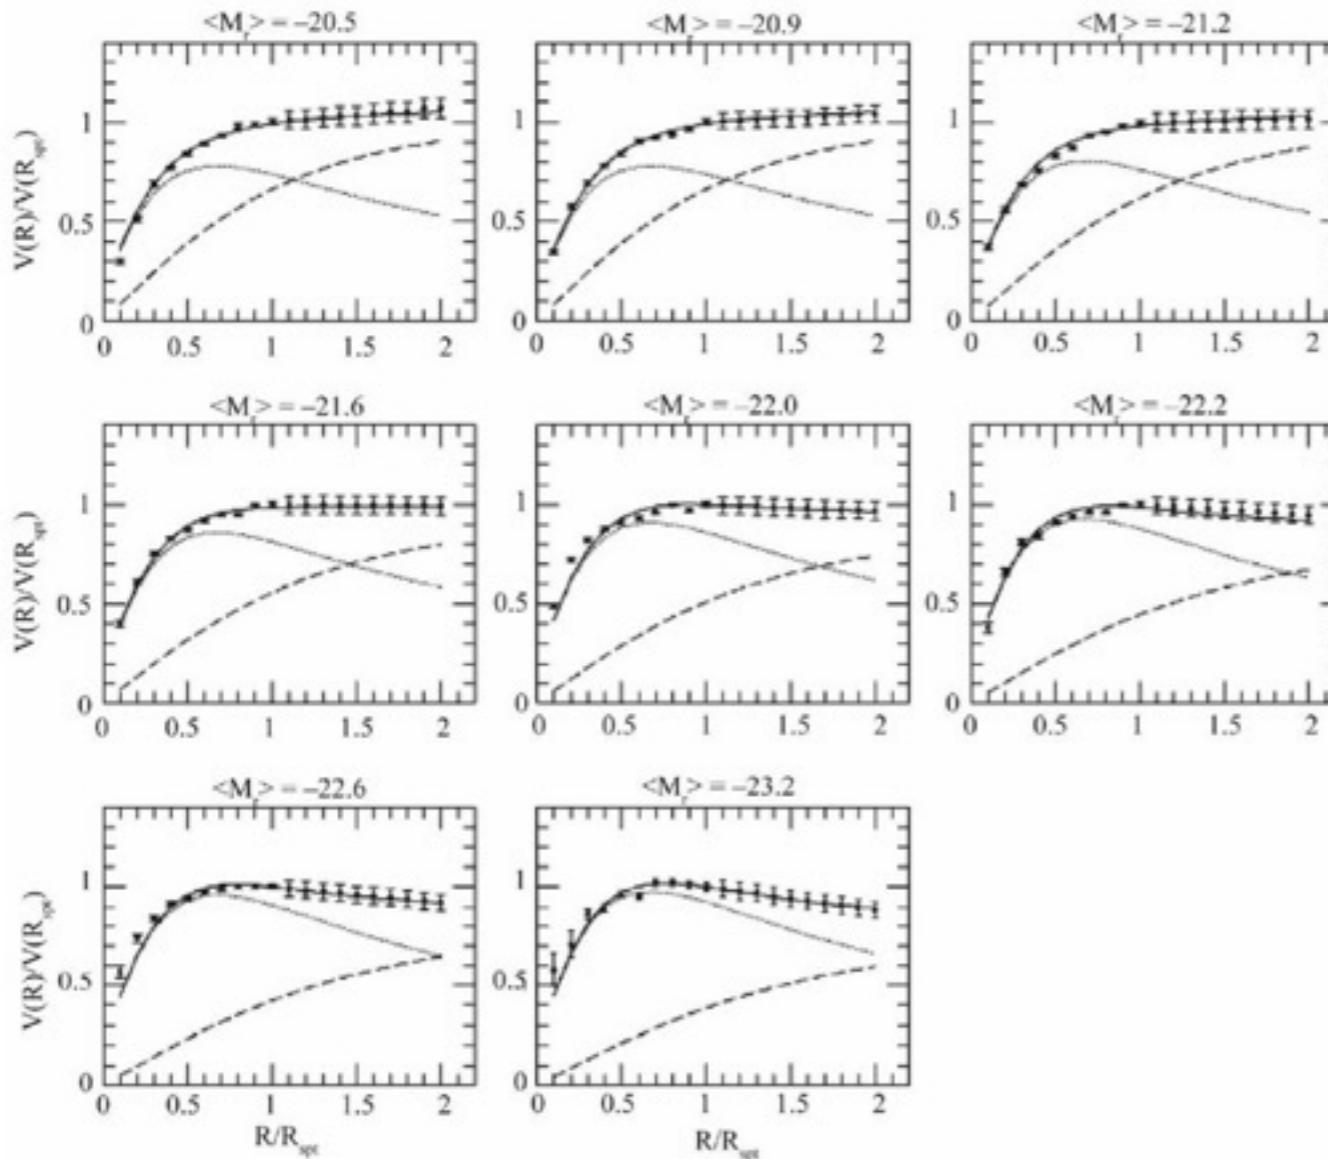

Non-visible mass component which increases with  $r$  must exist

$$M(r) \propto R$$

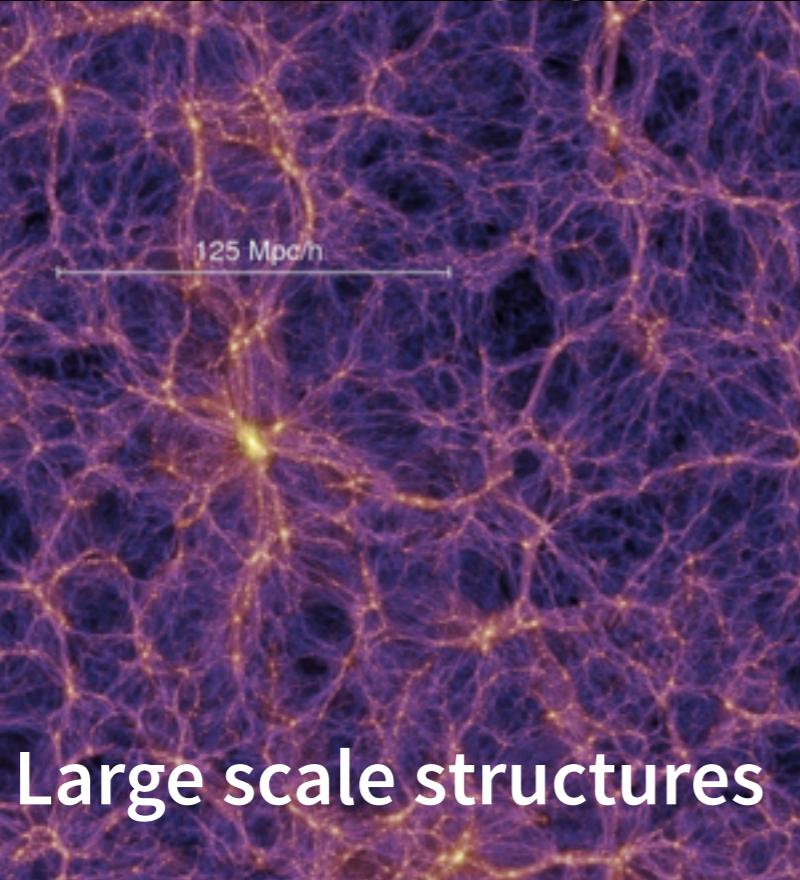

# First hints of Dark Matter: 70s/80s

- ▶ Some of the first measurements performed already in 40s by Babcock followed by further studies carried out in 70s/80s by Rubin and her team
- ▶ Rotation curves measured for many thousands of galaxies
  - Same flat behaviour observed moving far from the GC

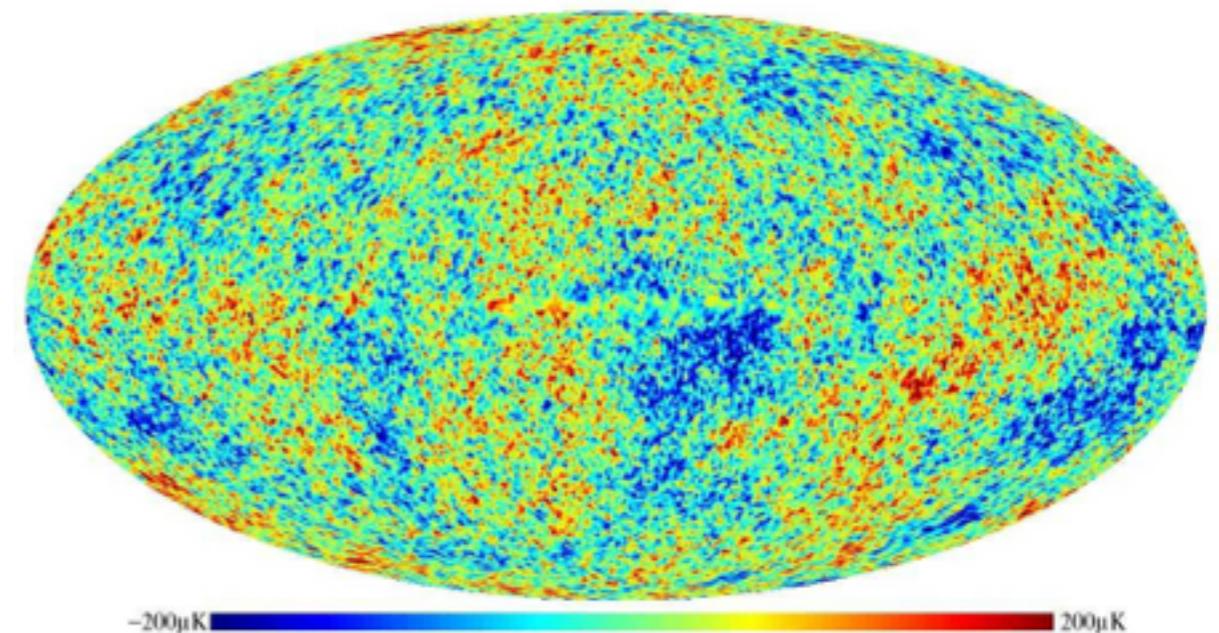

# Other evidences following...

Cluster Collisions

Large scale structures

CMB anisotropies

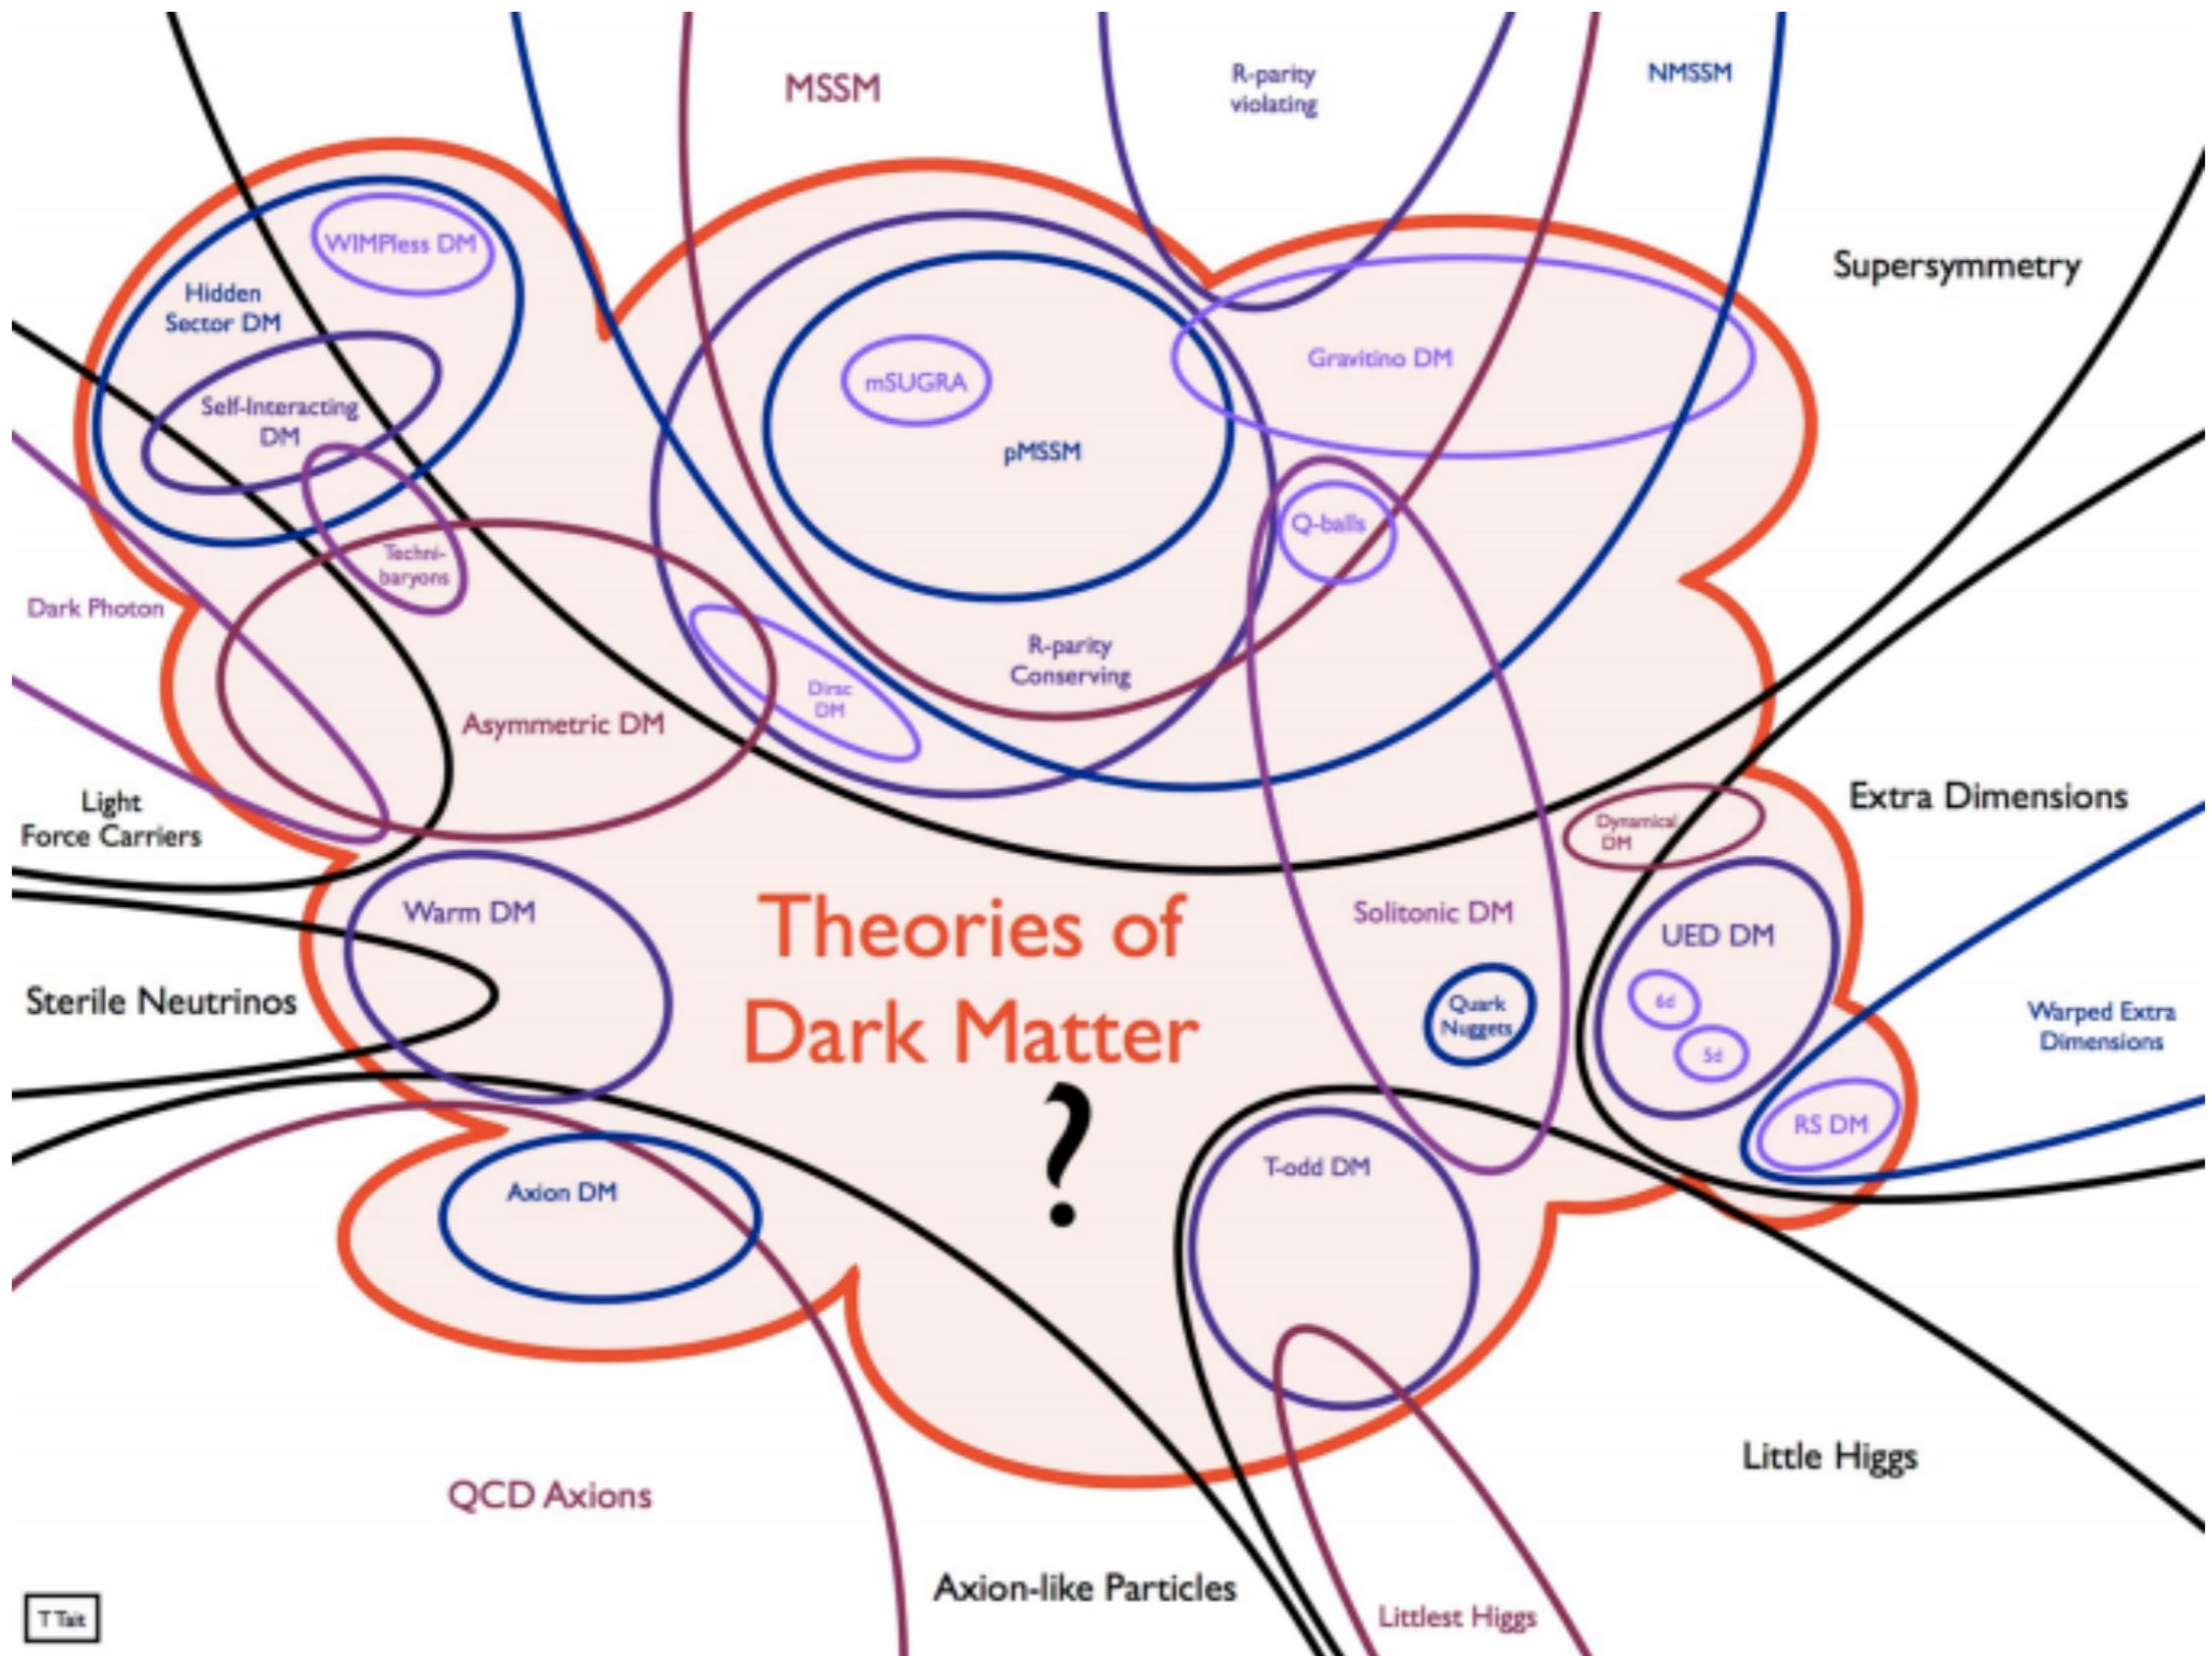

**Dark Matter is there  
outside**

What about its nature?

# Dark Matter ID

# A theory of Dark Matter?

# WIMPs

- ▶ Huge variety of hypotheses about DM nature

- WIMPs (Weakly Interacting Dark Matter Particles) are the promising candidates:
    - Massive, neutral, stable particles
    - Weakly interacting with SM particles ( $\sigma < 10^{-6}$  pb)

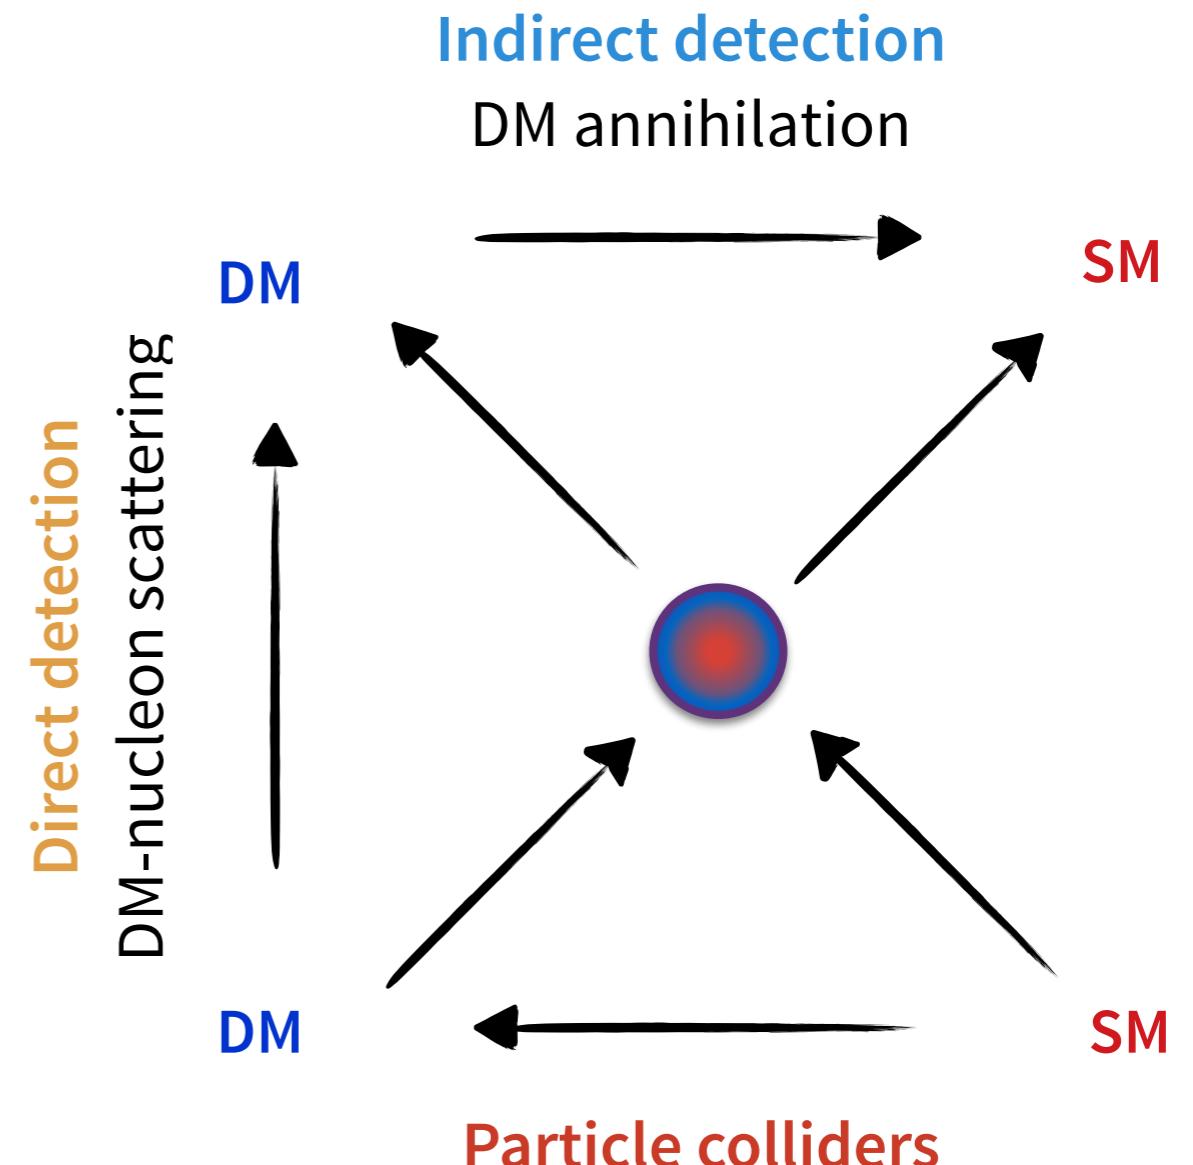

- WIMPs nicely fit matter density in the Universe

# Probing Dark Matter

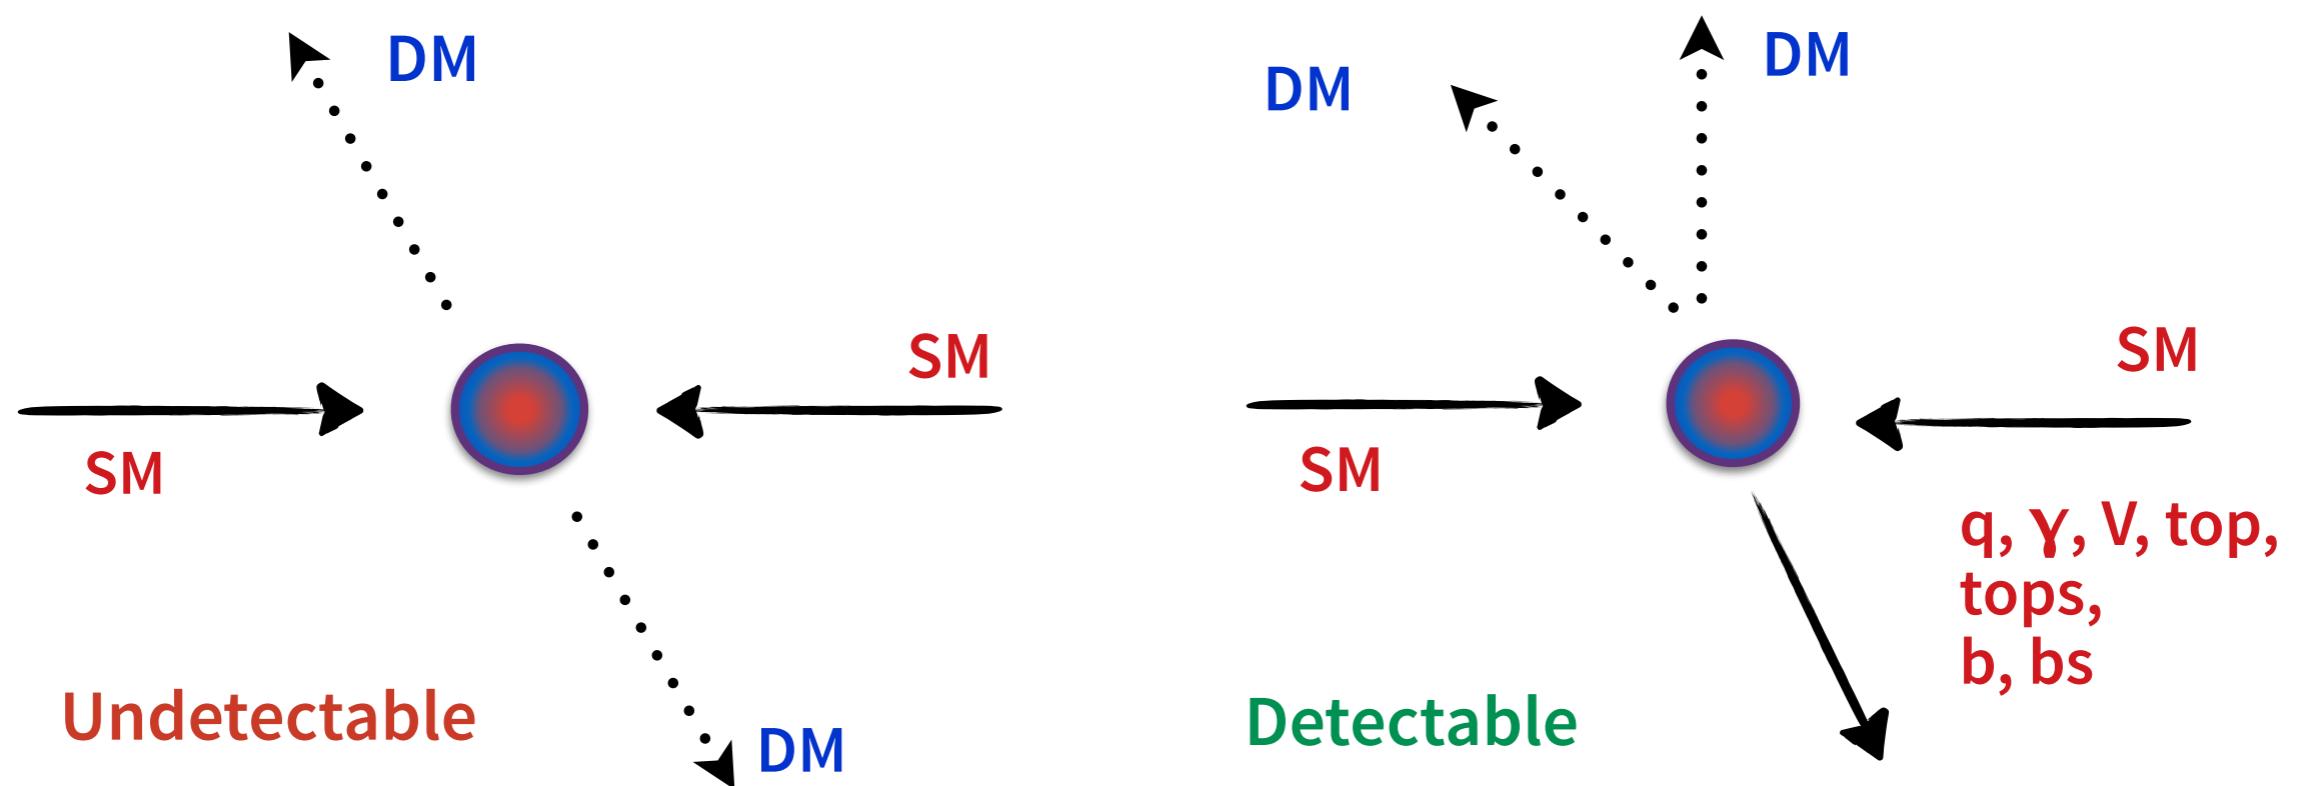

► Three main strategies to search for weakly interacting DM

- Direct detection
- Indirect detection
- Production at particle colliders

# Producing DM at particle colliders

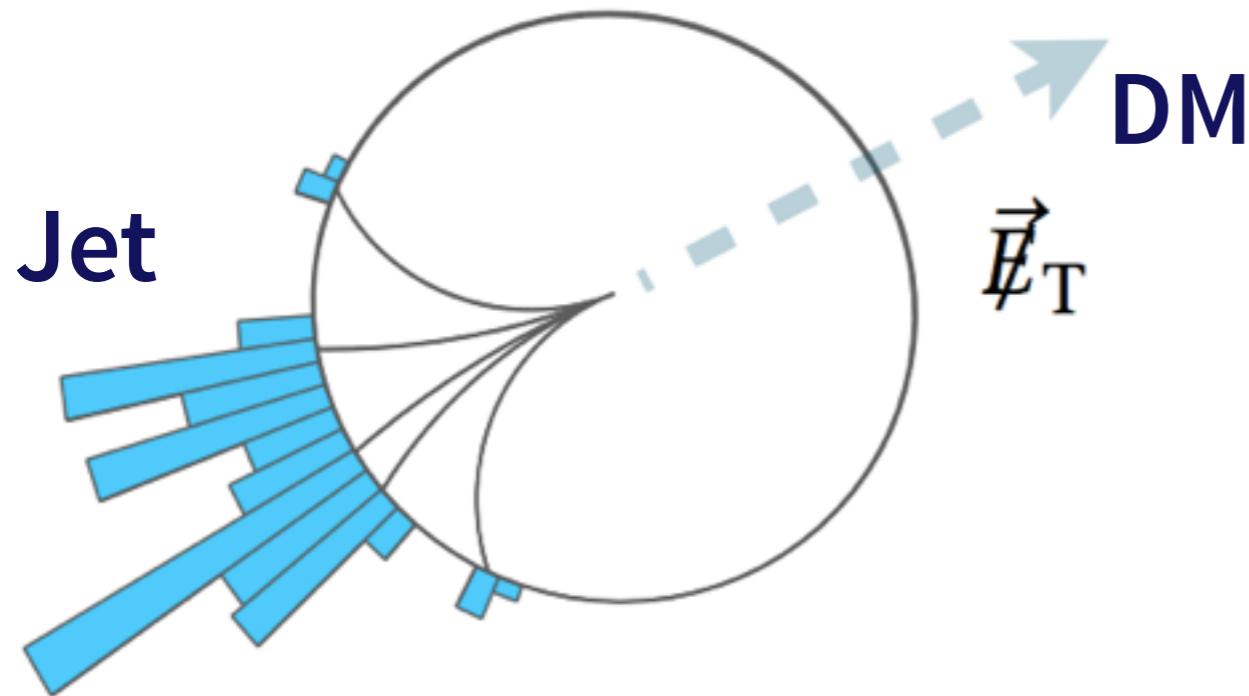

## Dark Matter pair production at particle colliders

**Dark Matter particles *invisible* to the detector**

**Visible objects used to flag DM production**

# Missing transverse momentum

$$E_T^{\text{miss}} = - \sum_i p_T^i$$

- ▶ Missing transverse momentum ( $E_T^{\text{miss}}$ ) is defined as *the negative sum of the transverse momenta of all reconstructed particles*
- ▶  $E_T^{\text{miss}}$  quantifies the energy imbalance due to invisible particle production

All DM searches at colliders rely on large amount of  $E_T^{\text{miss}}$

# Outline

## ► Interpretation of Dark Matter searches at LHC

- Effective Field Theory framework
- Simplified Models
- Interplay of direct searches and searches at colliders

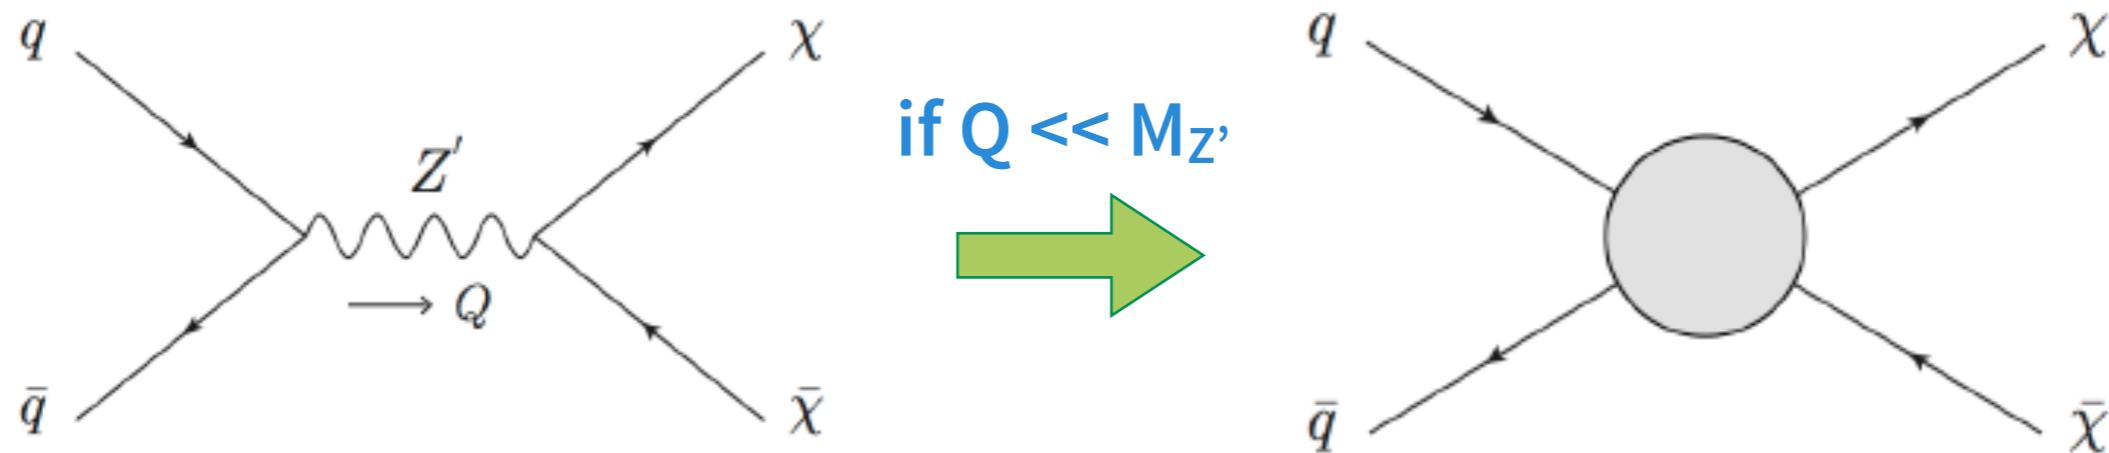

## ► DM searches at CMS and ATLAS

- Signal identification and background estimation techniques
- DM detection channels
  - DM + ISR jet/s
  - DM + Vector bosons
  - DM + Heavy Flavour quarks
- Results from LHC Run-II

## ► Conclusions

# Effective Field Theory

Interpret the search in terms of Effective Field Theory (EFT)

## 2 theory parameters

- ▶ Dark Matter particle mass  $m_\chi$
- ▶ Interaction scale  $M^* = M_{\text{med}}/\sqrt{(g_x g_q)}$

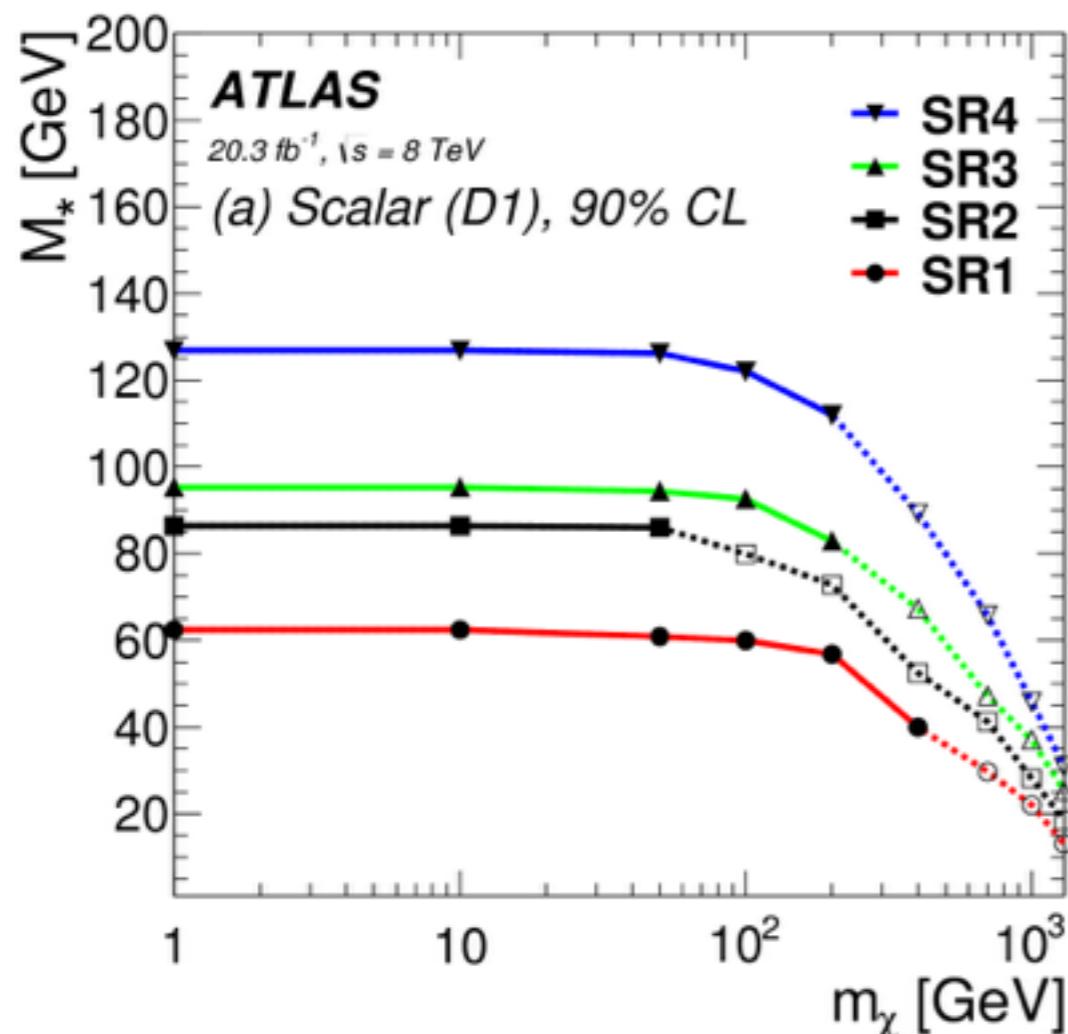

## Plus interaction nature

Name	Initial state	Type	Operator
C1	$qq$	scalar	$\frac{m_q}{M_*^2} \chi^\dagger \chi \bar{q} q$
C5	$gg$	scalar	$\frac{1}{4M_*^2} \chi^\dagger \chi \alpha_s (G_{\mu\nu}^a)^2$
D1	$qq$	scalar	$\frac{m_q}{M_*^3} \bar{\chi} \chi \bar{q} q$
D5	$qq$	vector	$\frac{1}{M_*^2} \bar{\chi} \gamma^\mu \chi \bar{q} \gamma_\mu q$
D8	$qq$	axial-vector	$\frac{1}{M_*^2} \bar{\chi} \gamma^\mu \gamma^5 \chi \bar{q} \gamma_\mu \gamma^5 q$
D9	$qq$	tensor	$\frac{1}{M_*^2} \bar{\chi} \sigma^{\mu\nu} \chi \bar{q} \sigma_{\mu\nu} q$
D11	$gg$	scalar	$\frac{1}{4M_*^3} \bar{\chi} \chi \alpha_s (G_{\mu\nu}^a)^2$

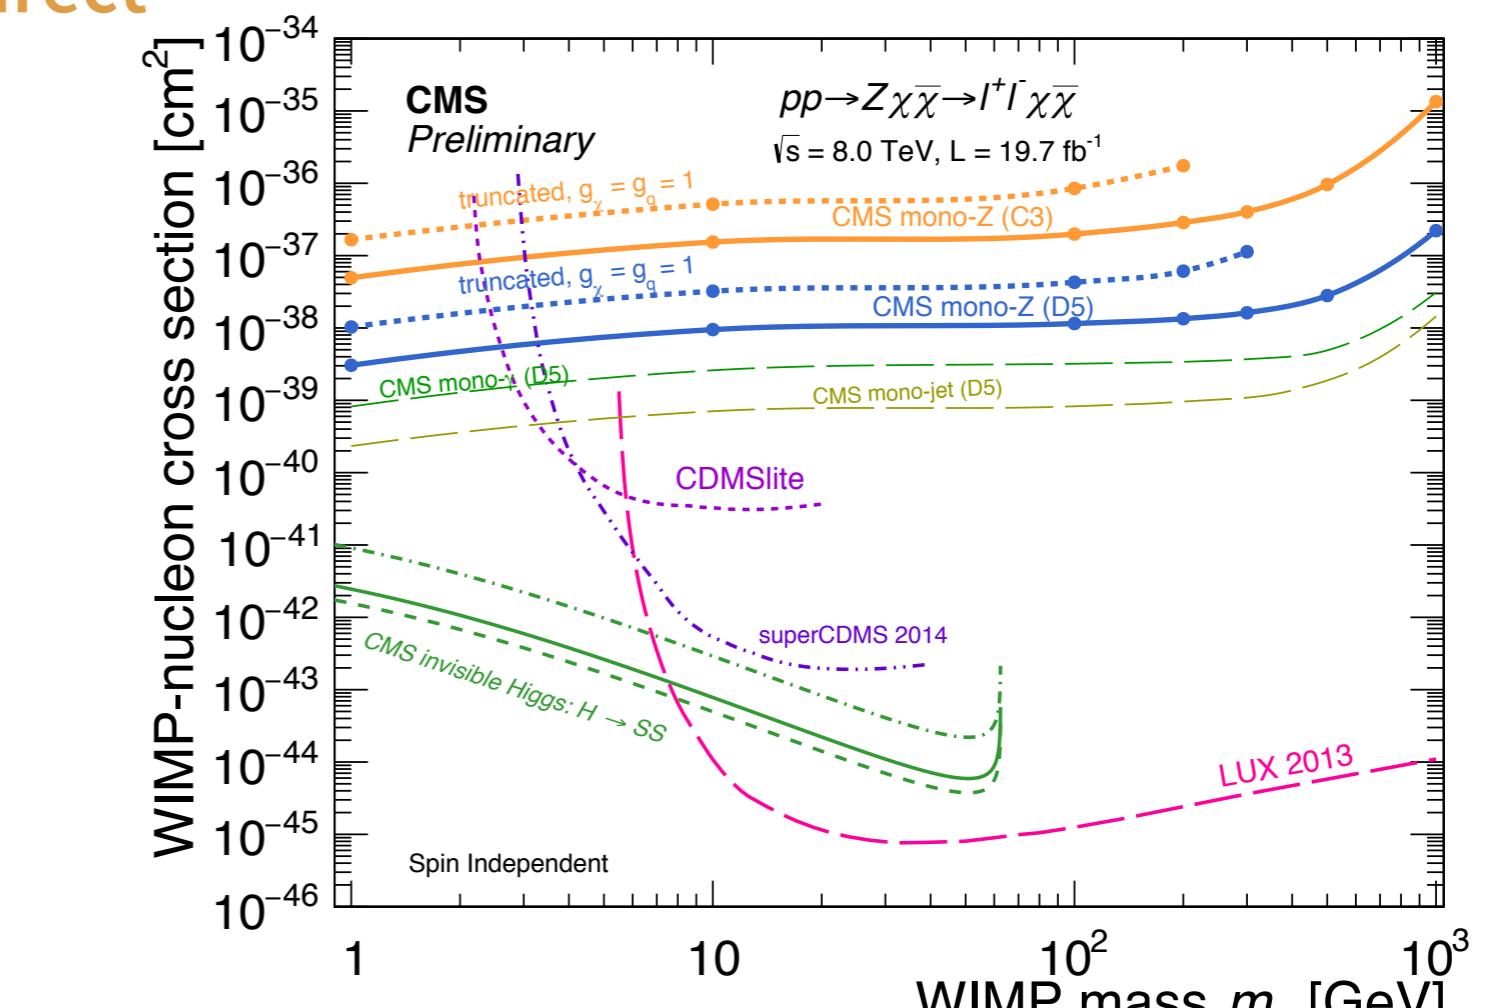

# Comparison to DD experiments

EFT allow a comparison to direct detection searches

Constraint on  $M^*$

Constraint on  $\sigma_{\text{DM}-n}$

Collider searches sensitive to low DM mass region

Complementarity to DD experiments

# EFT limitations

EFT doesn't correctly accounts for kinematics and is not valid for  $Q < m_{\text{MED}}$

► High  $m_{\text{Med}}$ :

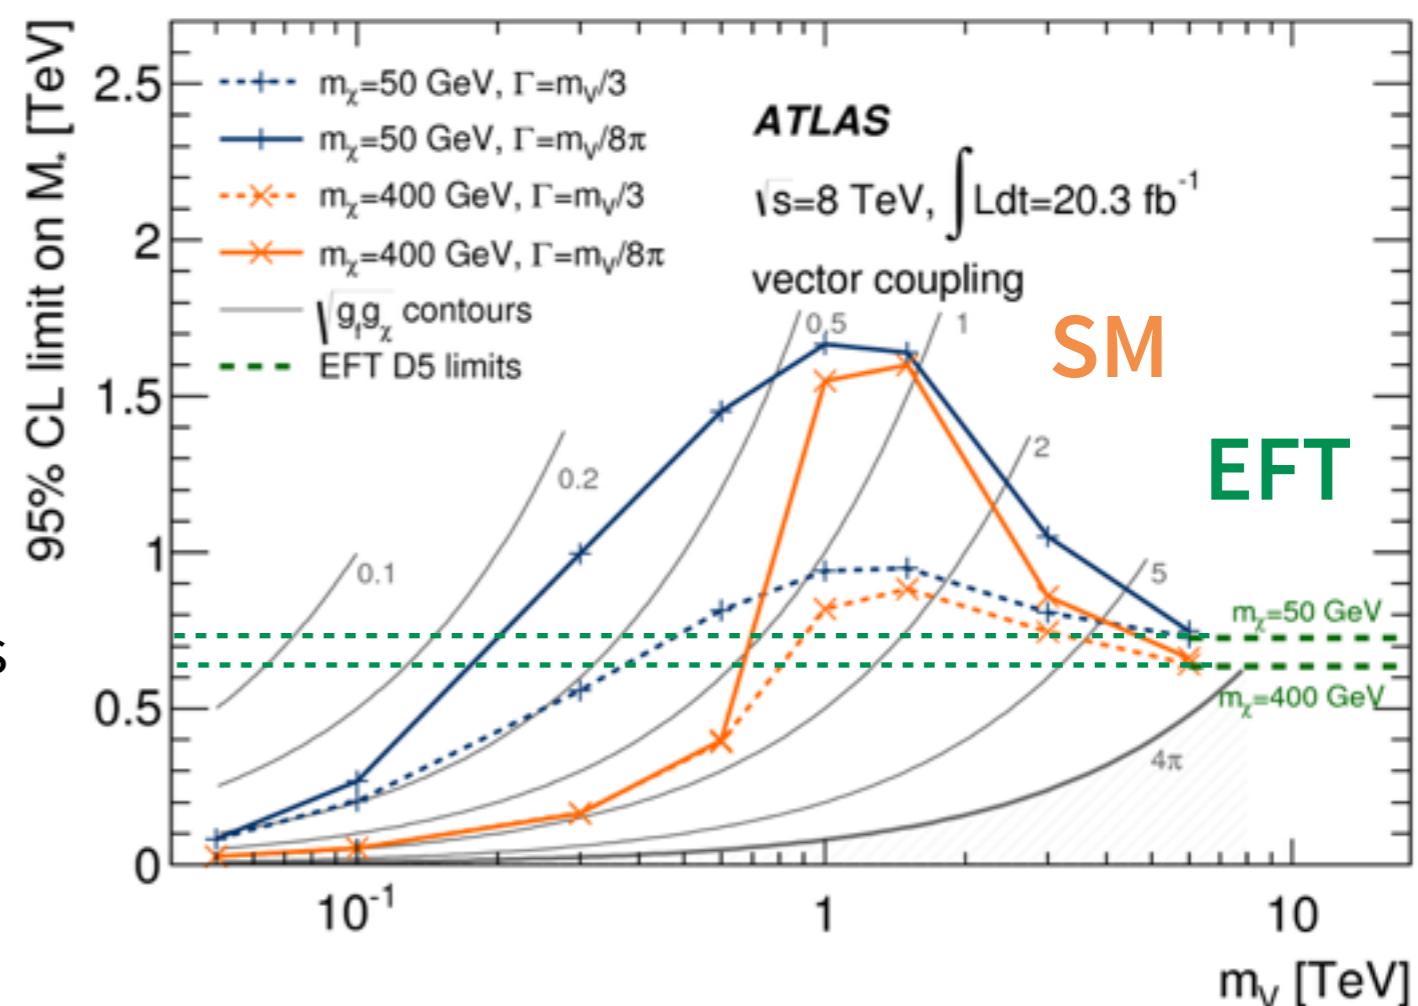

- EFT consistent with SM

► Intermediate  $m_{\text{Med}}$ :

- On-shell production increases  $\sigma$
- EFT limits too weak

► Low  $m_{\text{Med}}$ :

- Off-shell production  $\rightarrow \sigma$  decreases
- Events are softer
- EFT limits too strong

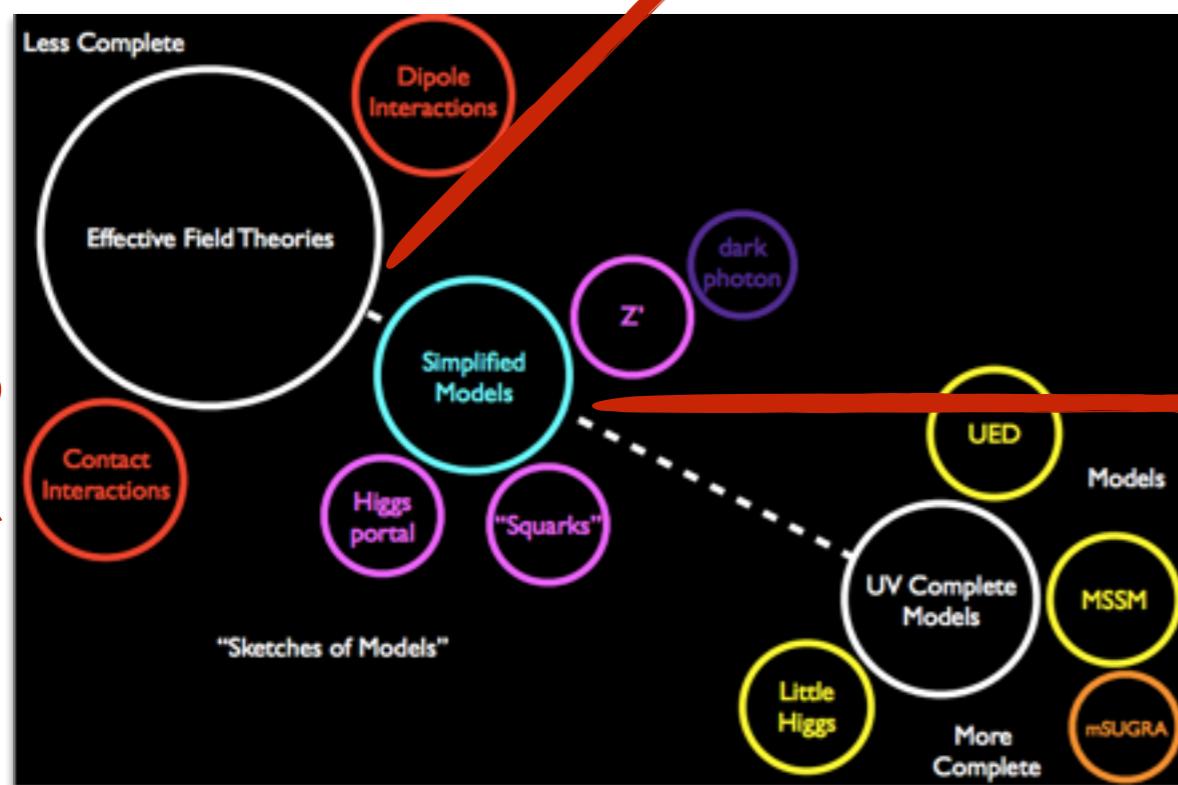

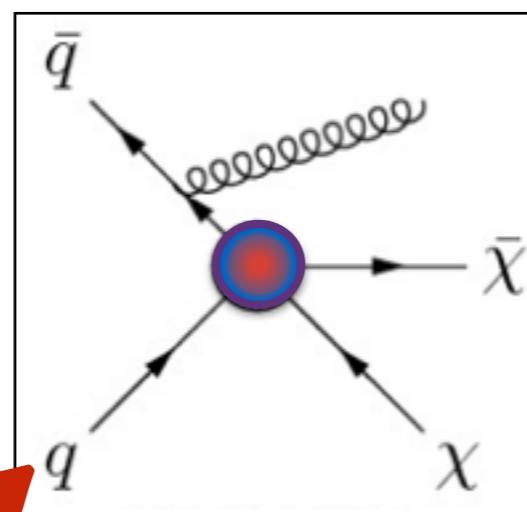

EFT not an appropriate approach to reach a comprehensive interpretation of DM searches

# Beyond EFT: Simplified models

## EFT validity issue [if $Q > M_{\text{med}}$ ]

Critical at high energies

$$\sigma \propto \frac{1}{M^{*4}} \quad [M^*, m_X]$$

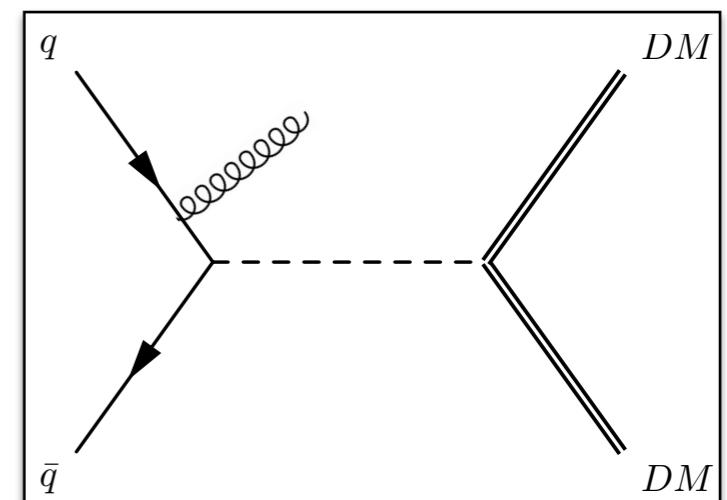

## Simplified Models

Overcome EFT validity issue  
Direct access to the mediator

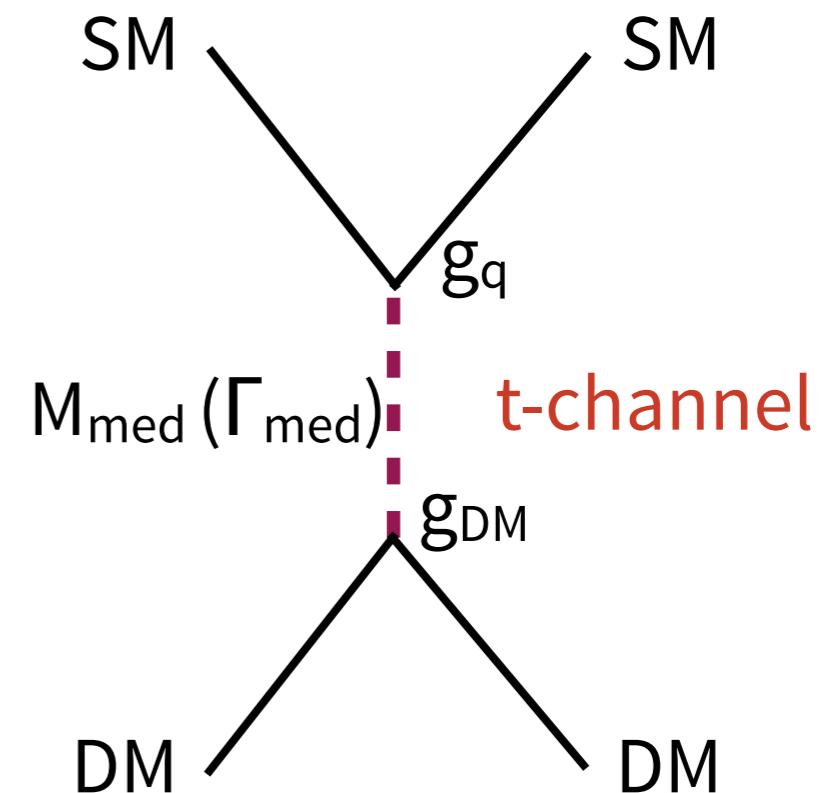

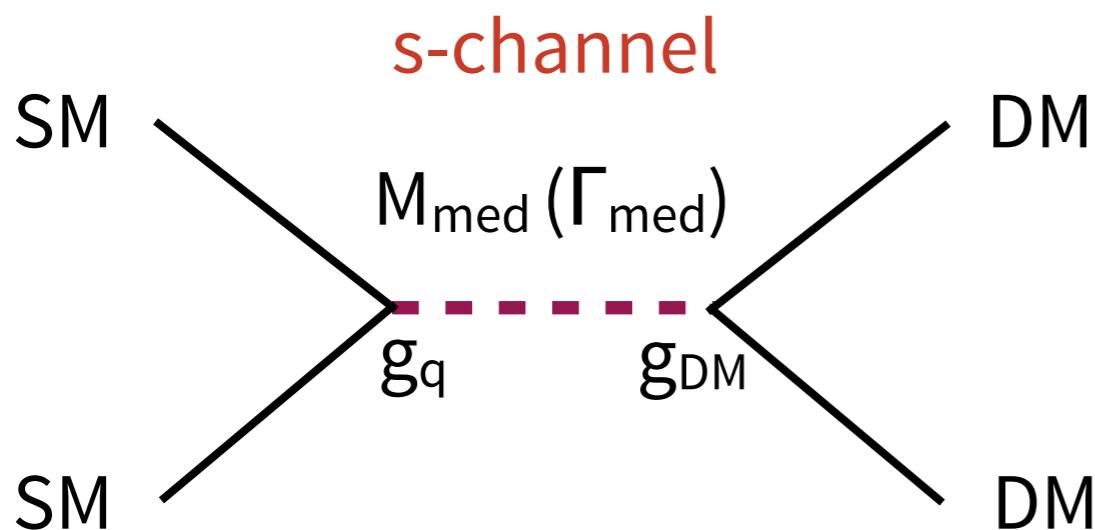

$$\sigma \propto \frac{g_{SM}^2 g_{DM}^2}{M_{\text{med}}^4}$$

$[M_{\text{med}}, \Gamma_{\min}, m_X, g_{SM}, g_{DM}]$

# Simplified Models

DM production characterised by a small set of parameters

4 parameters

$m_{\text{DM}}$	$M_{\text{med}}$
$g_q$	$g_{\text{DM}}$

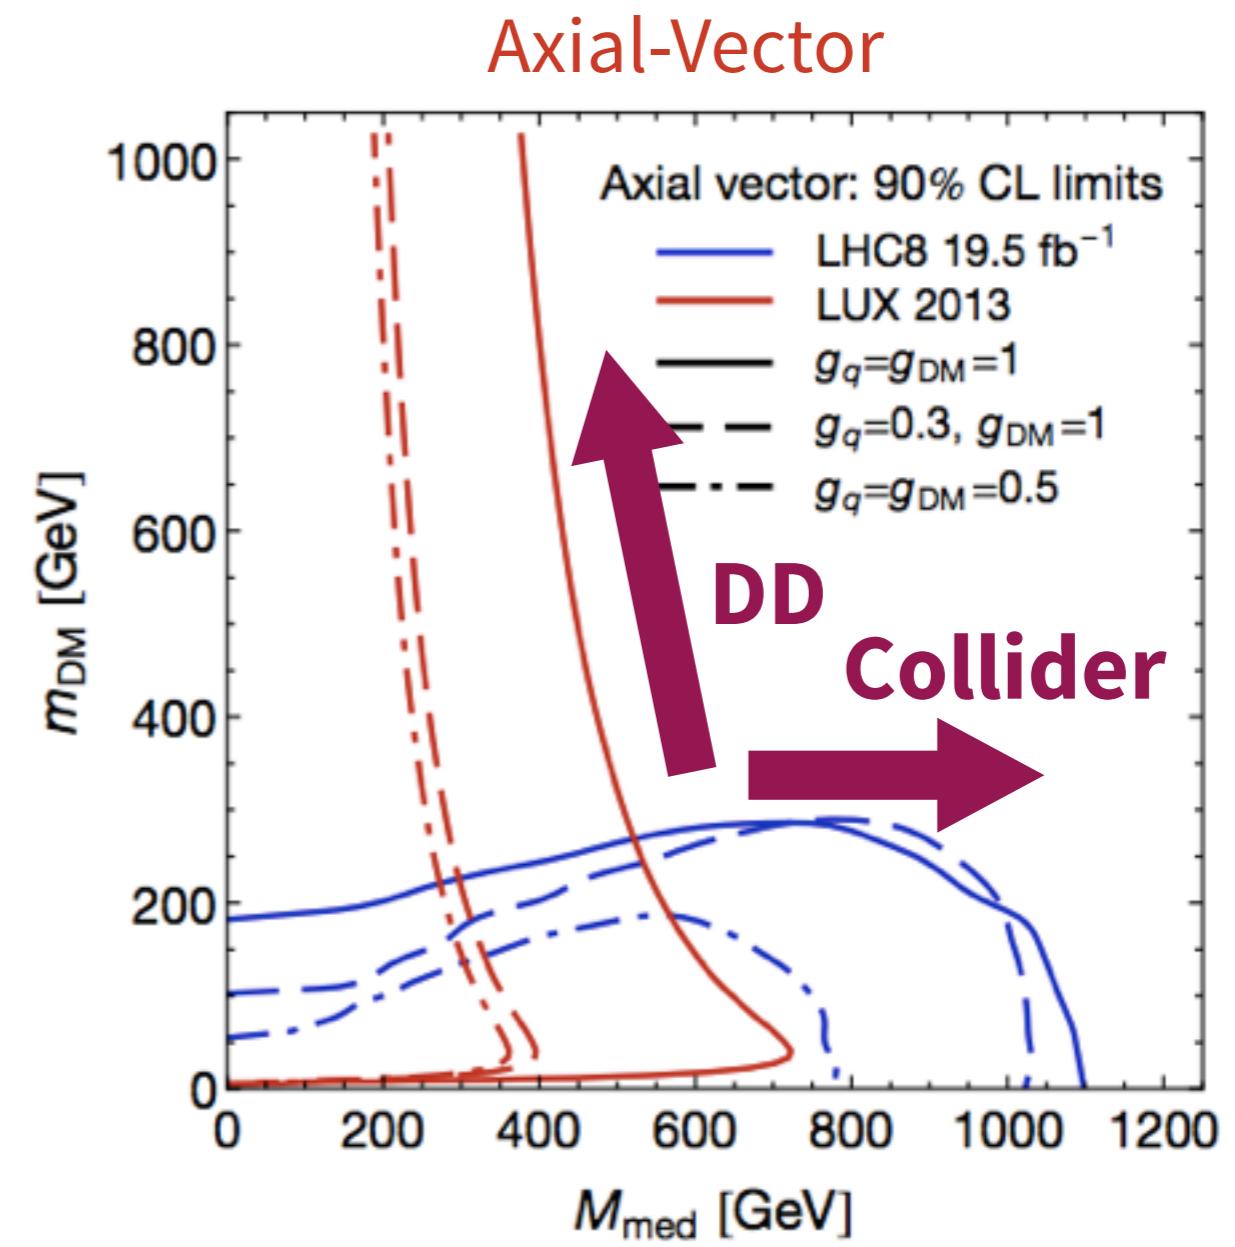

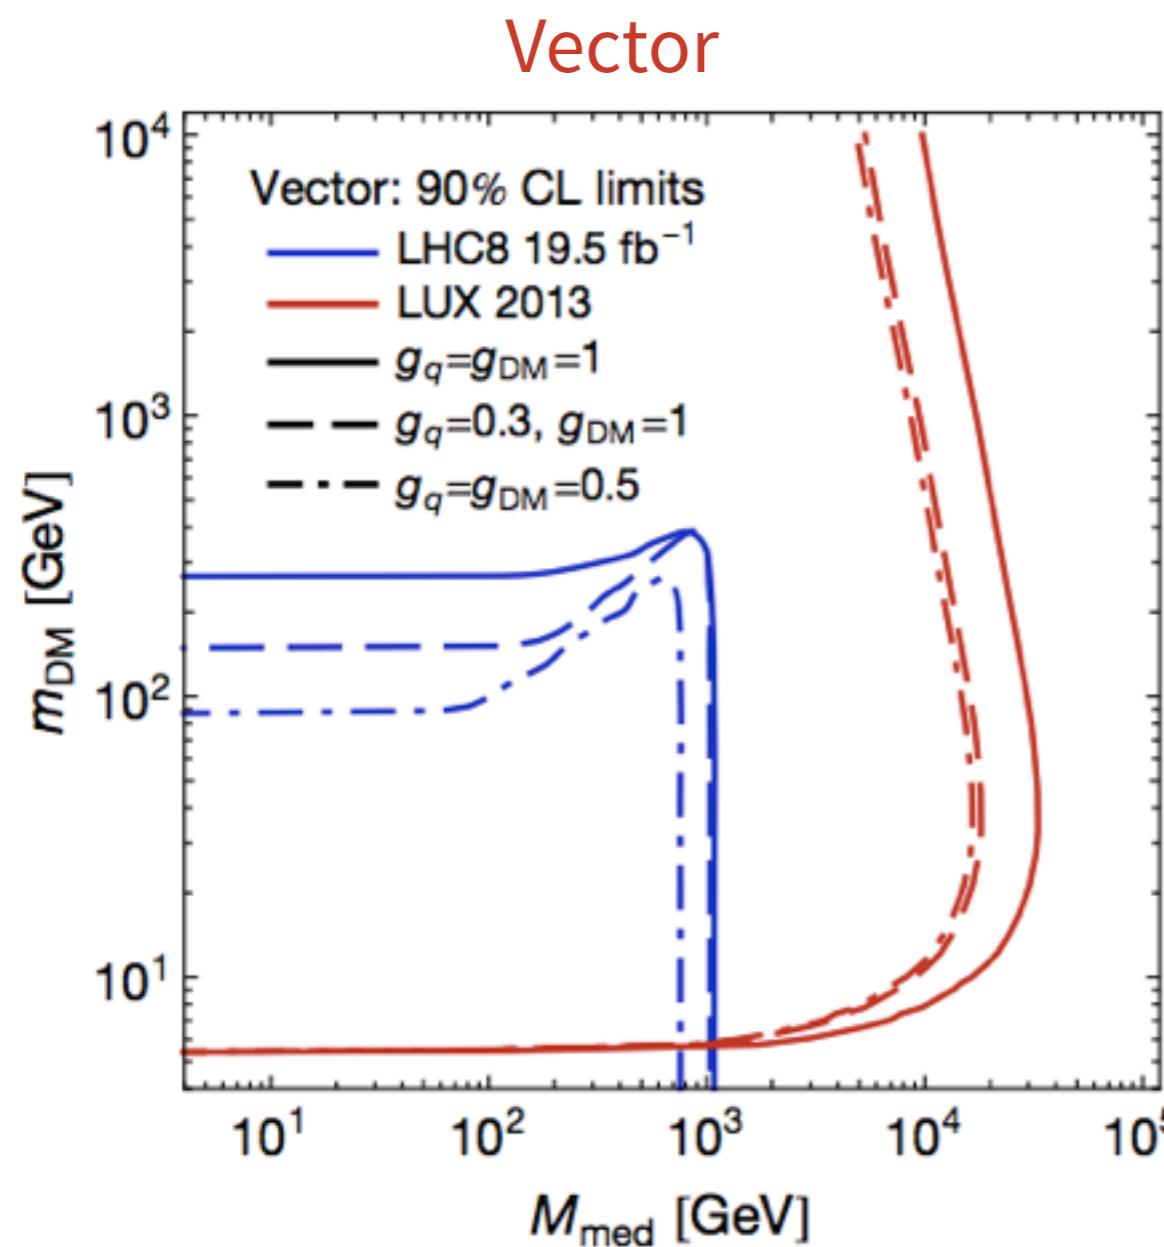

Mediators

Vector	Axial-Vector
Scalar	Pseudo-Scalar

Dirac fermion  
DM particle

LHC DM Forum: arXiv:1507.00966

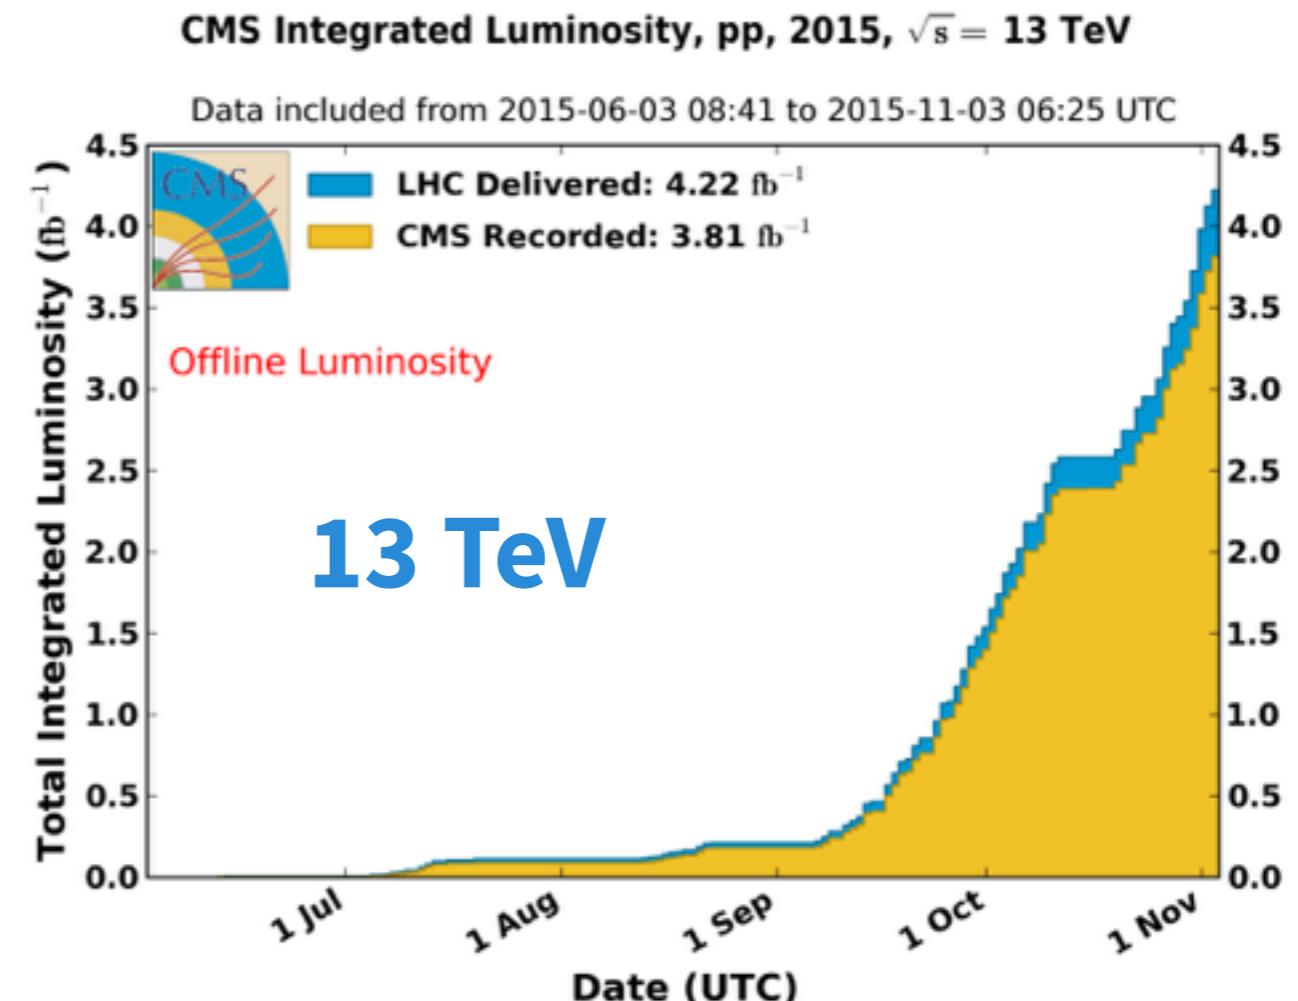

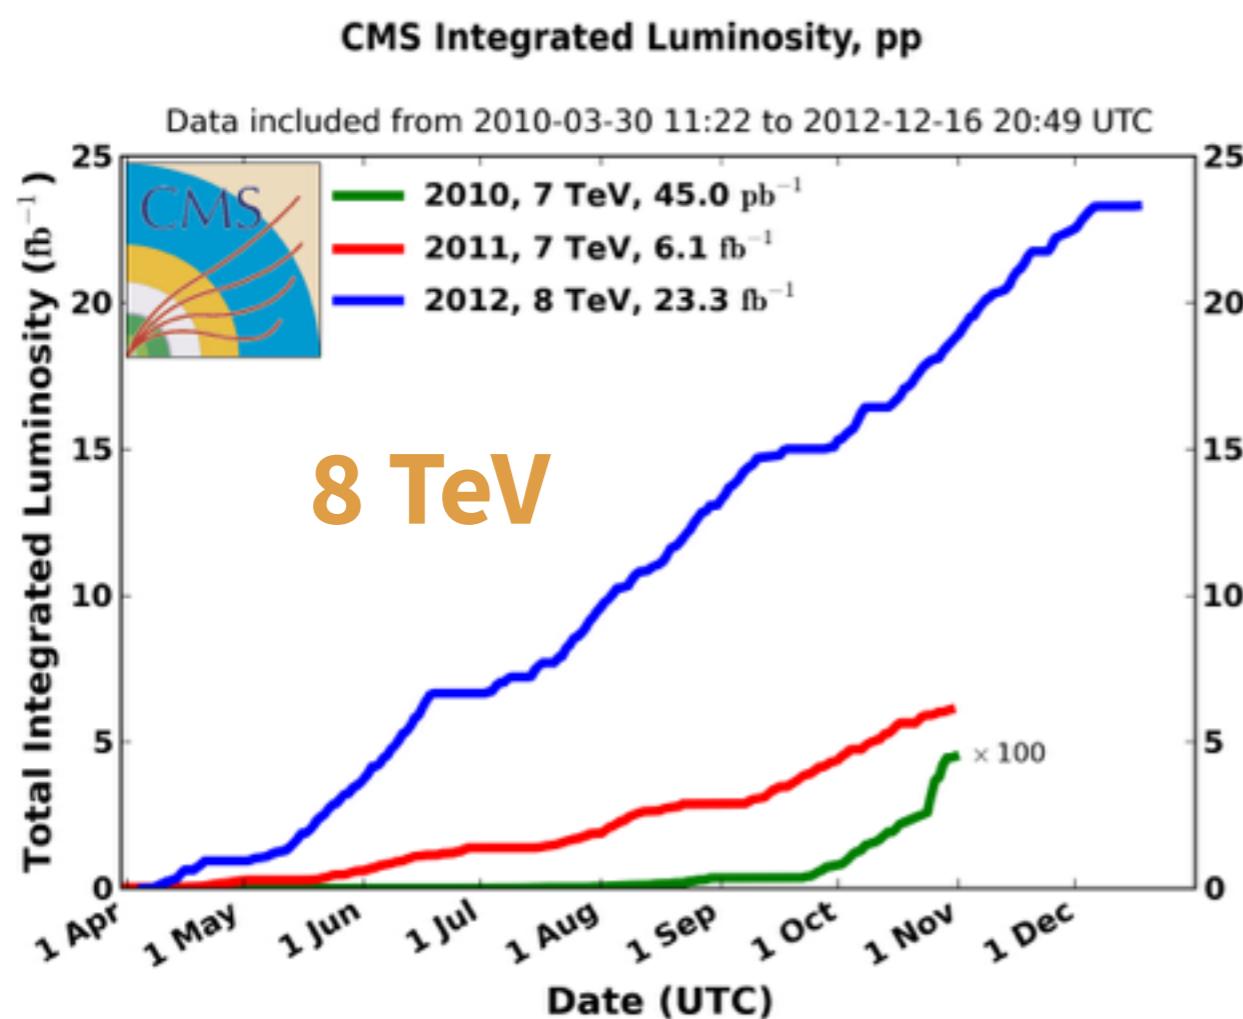

# Collider vs Direct Detection

Direct detection limited at  $m_{\text{DM}} \sim 6$  GeV

# LHC p-p collision harvest

~25  $\text{fb}^{-1}$  of p-p data delivered by LHC @ 8 TeV in 2012

2015 → centre-of-mass energy raised up to 13 TeV

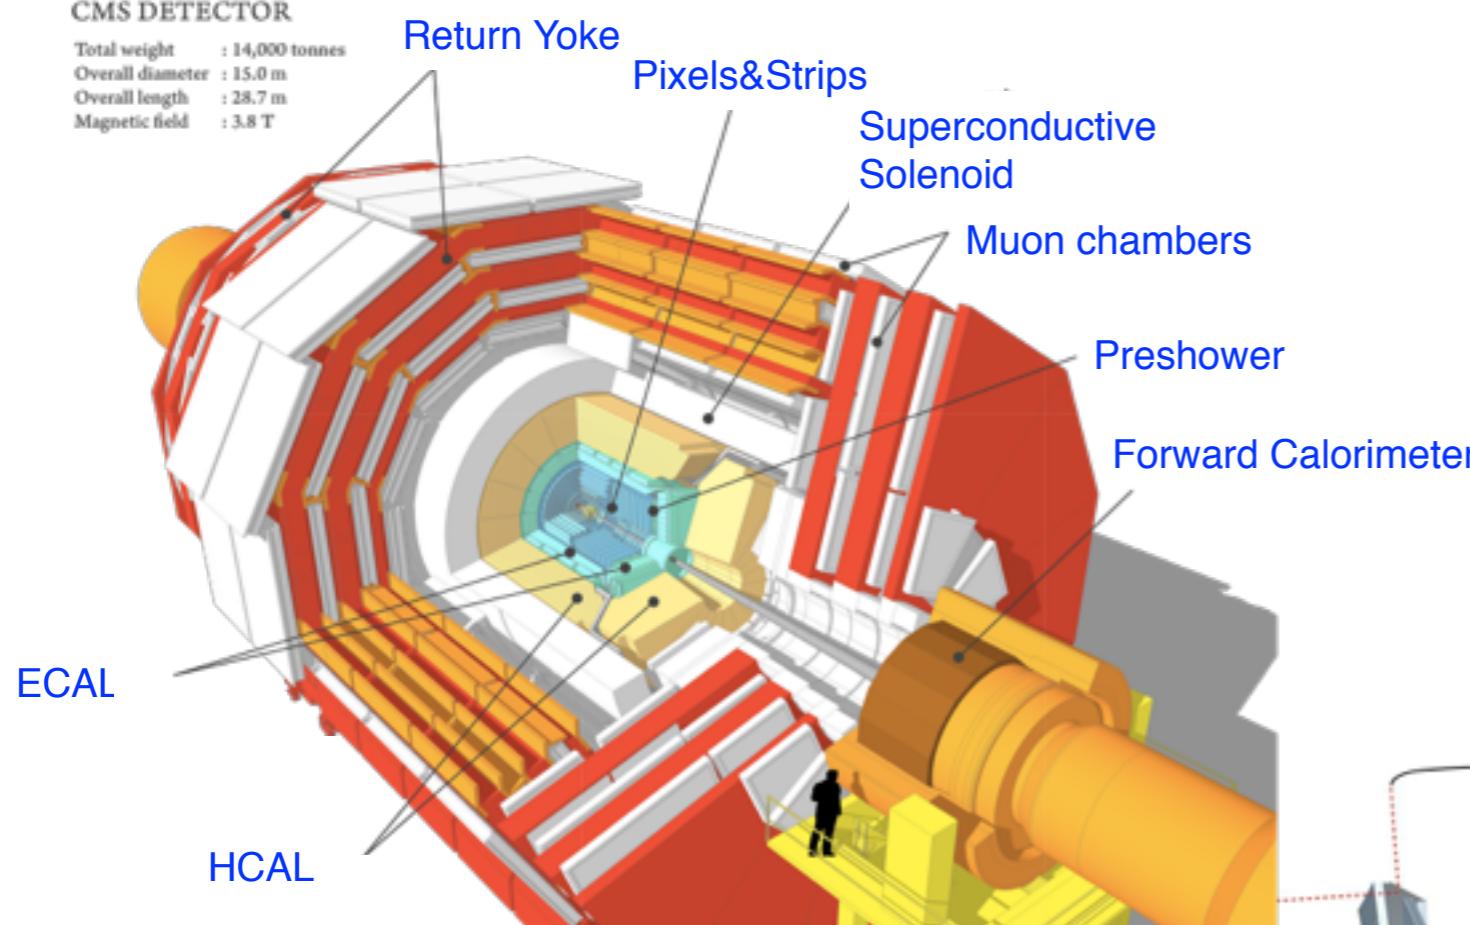

~4  $\text{fb}^{-1}$  of p-p data delivered in 2015

~ 25  $\text{fb}^{-1}$  expected in 2016

# ATLAS and CMS

CMS DETECTOR

Total weight : 14,000 tonnes  
 Overall diameter : 15.0 m  
 Overall length : 28.7 m  
 Magnetic field : 3.8 T

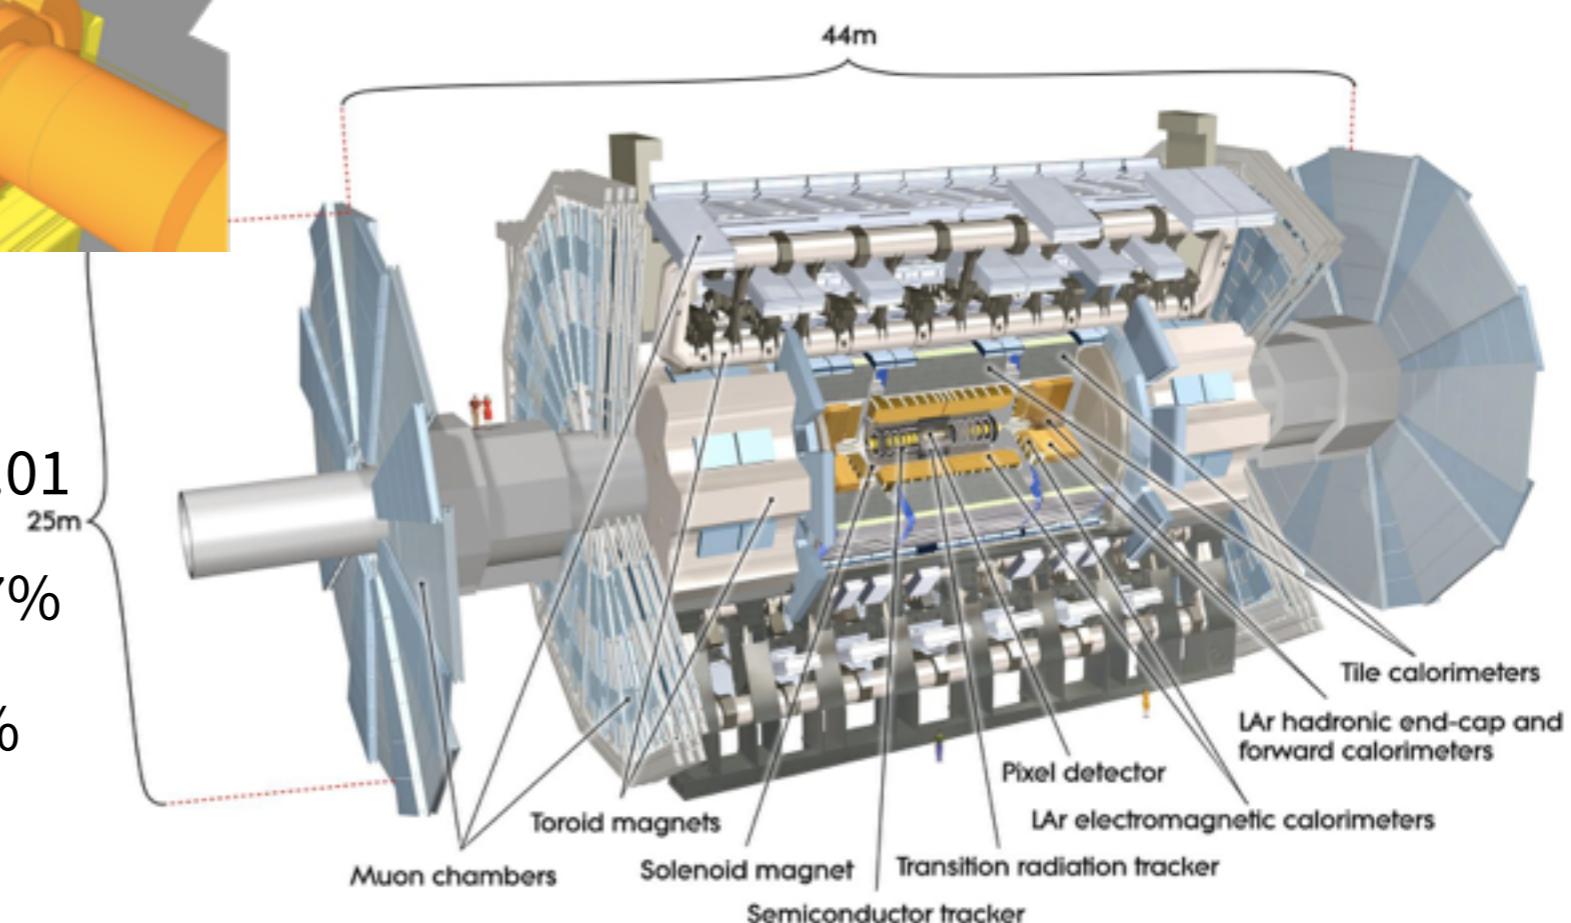

## CMS

- ▶ Tracker:  $\sigma(p_T)/p_T \sim 1.5 \cdot 10^{-4} p_T + 0.005$
- ▶ ECAL:  $\sigma_E/E \sim 3\%/\sqrt{E} \text{ [GeV]} \oplus 0.5\%$
- ▶ HCAL:  $\sigma_E/E \sim 100\%/\sqrt{E} \text{ [GeV]} \oplus 5\%$
- ▶ Trk+Mu: 1%÷10% [50 GeV-1 TeV]

## ATLAS

- ▶ Tracker:  $\sigma(p_T)/p_T \sim 5 \cdot 10^{-4} p_T + 0.01$
- ▶ ECAL:  $\sigma_E/E \sim 10\%/\sqrt{E} \text{ [GeV]} \oplus 0.7\%$
- ▶ HCAL:  $\sigma_E/E \sim 50\%/\sqrt{E} \text{ [GeV]} \oplus 3\%$
- ▶ Trk+Mu: 2%÷10% [50 GeV-1 TeV]

# Experimental Approach to DM searches

**Select events with large amount of missing momentum**

*Indicates production of WIMPs*

**Reconstruct visible objects to flag DM production**

*Jet/s from ISR, Vector bosons ( $W, Z, \gamma$ ), top or bottom quarks*

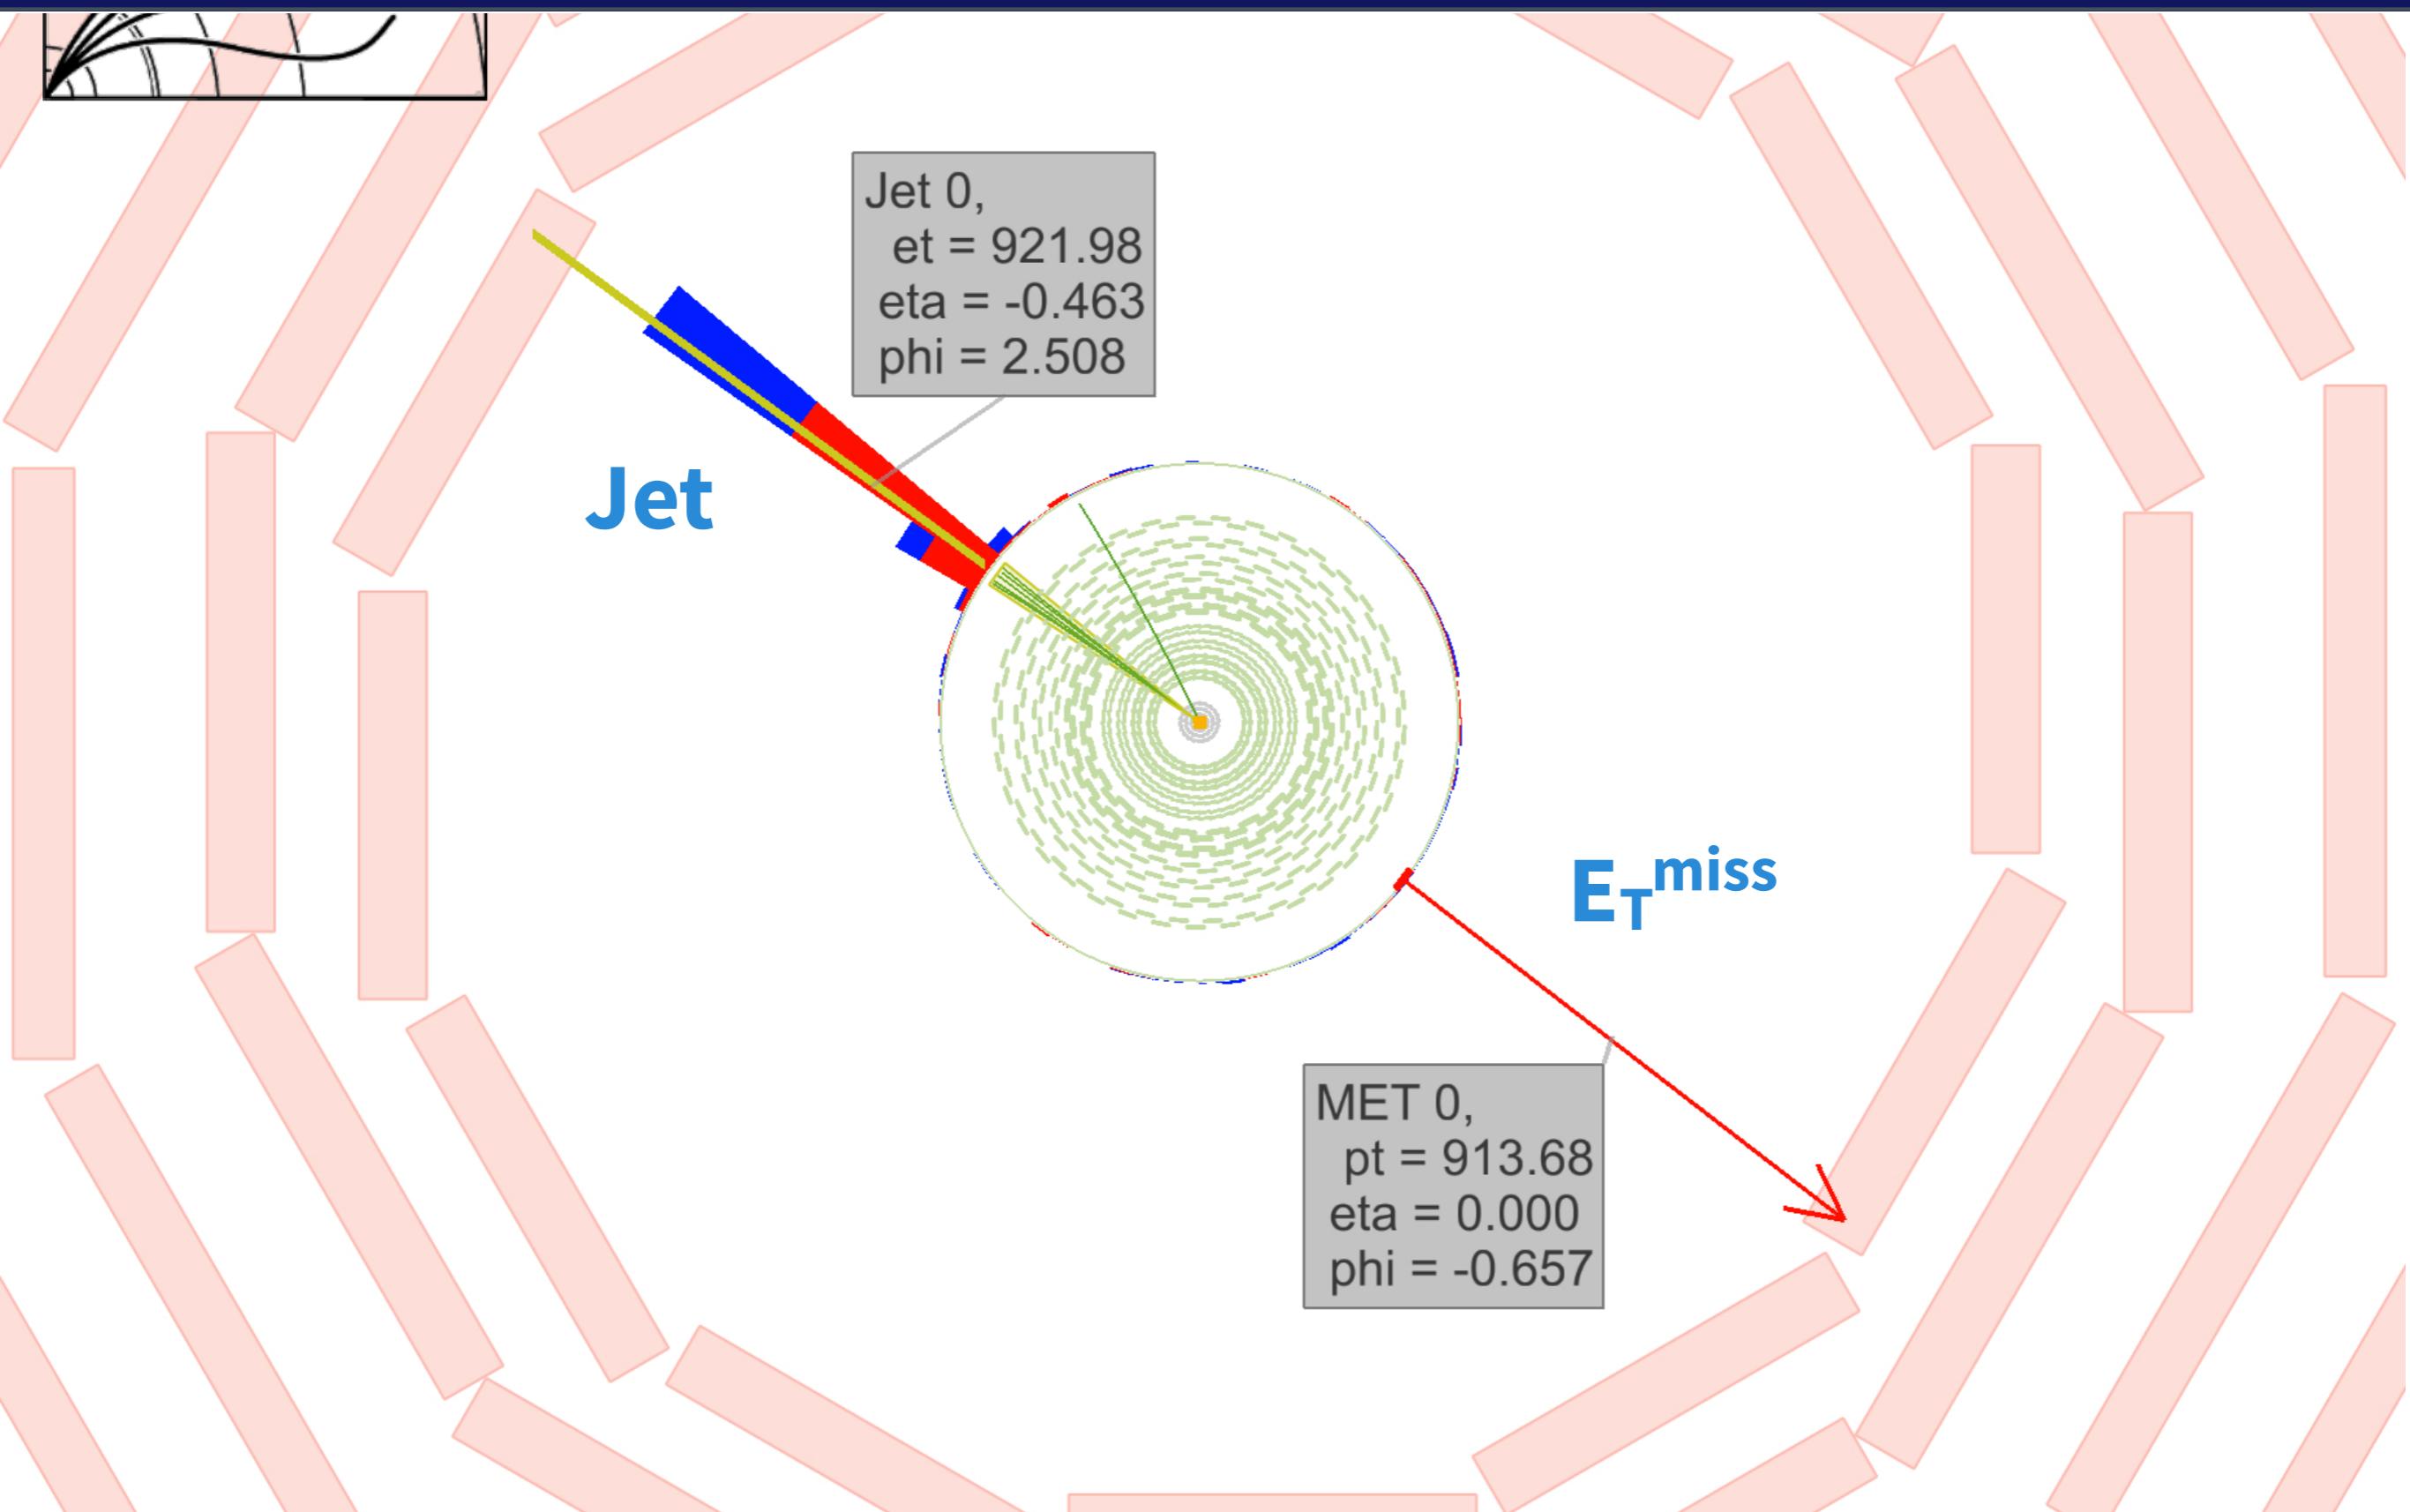

**Estimate backgrounds from data**

**Interpret search results**

# Monojet event display

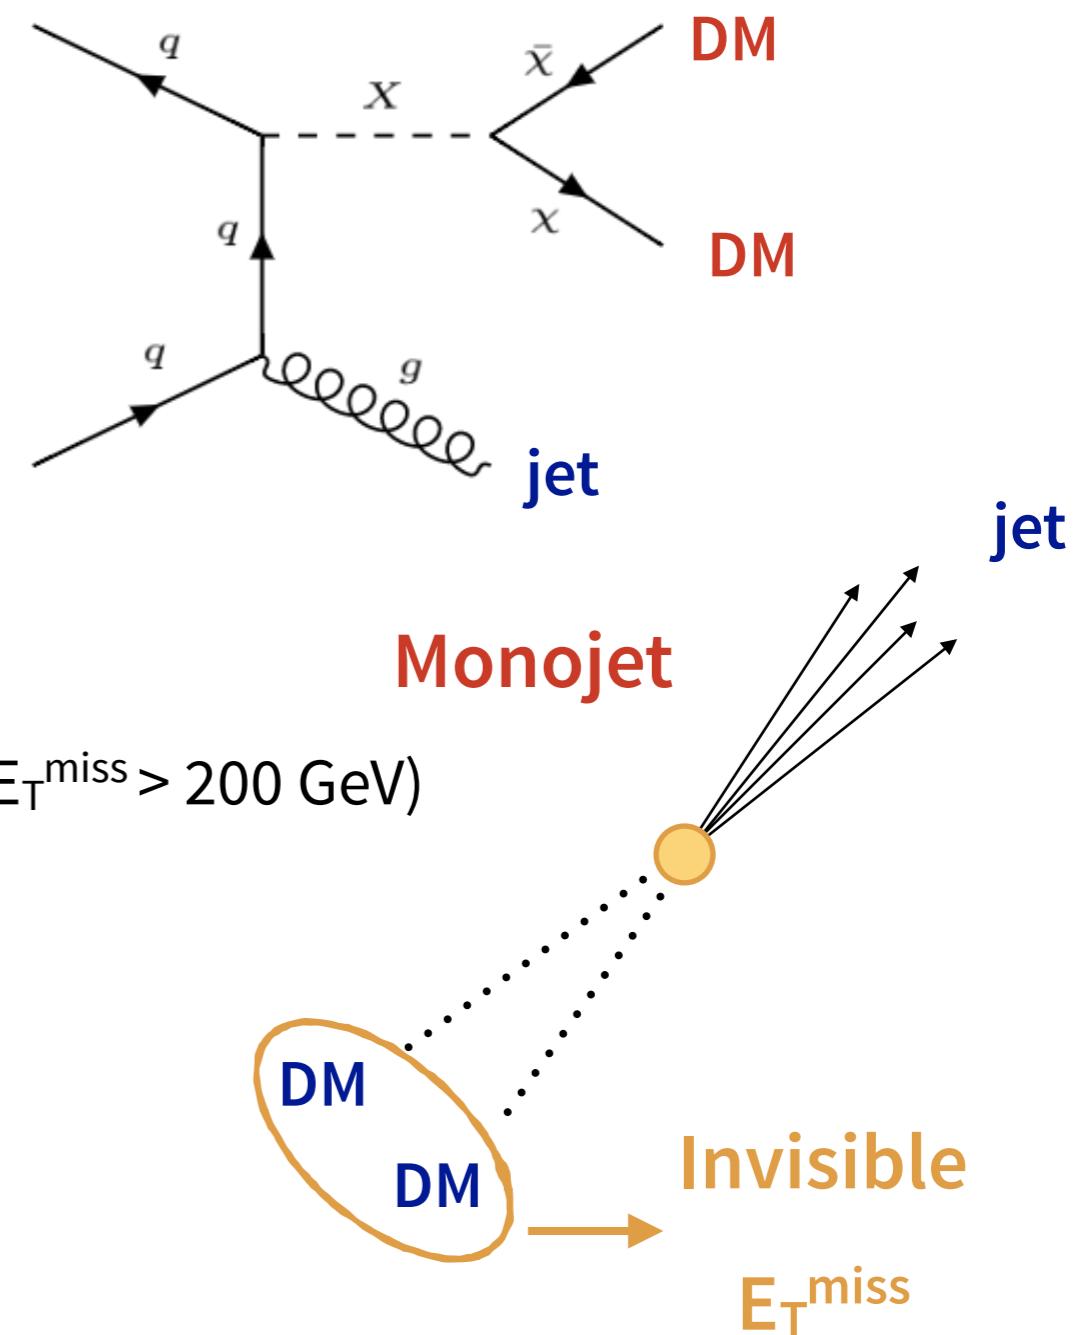

# Looking for DM in Monojet events

CMS PAS EXO-15-003

**Hard jet/s from initial state radiation (ISR) produced in association to a pair of DM particles**

- ▶ DM signal recoiling against QCD ISR
- ▶ Channel highly sensitive to DM production
  - High gluon production cross-section
- ▶ Signal events signature:
  - At least 1 high  $p_T$  jet ( $p_T > 100$  GeV)
  - Large energy imbalance in transverse plane ( $E_T^{\text{miss}} > 200$  GeV)
  - No leptons or photons
- ▶ Key variable
  - Missing transverse energy spectrum,  $E_T^{\text{miss}}$

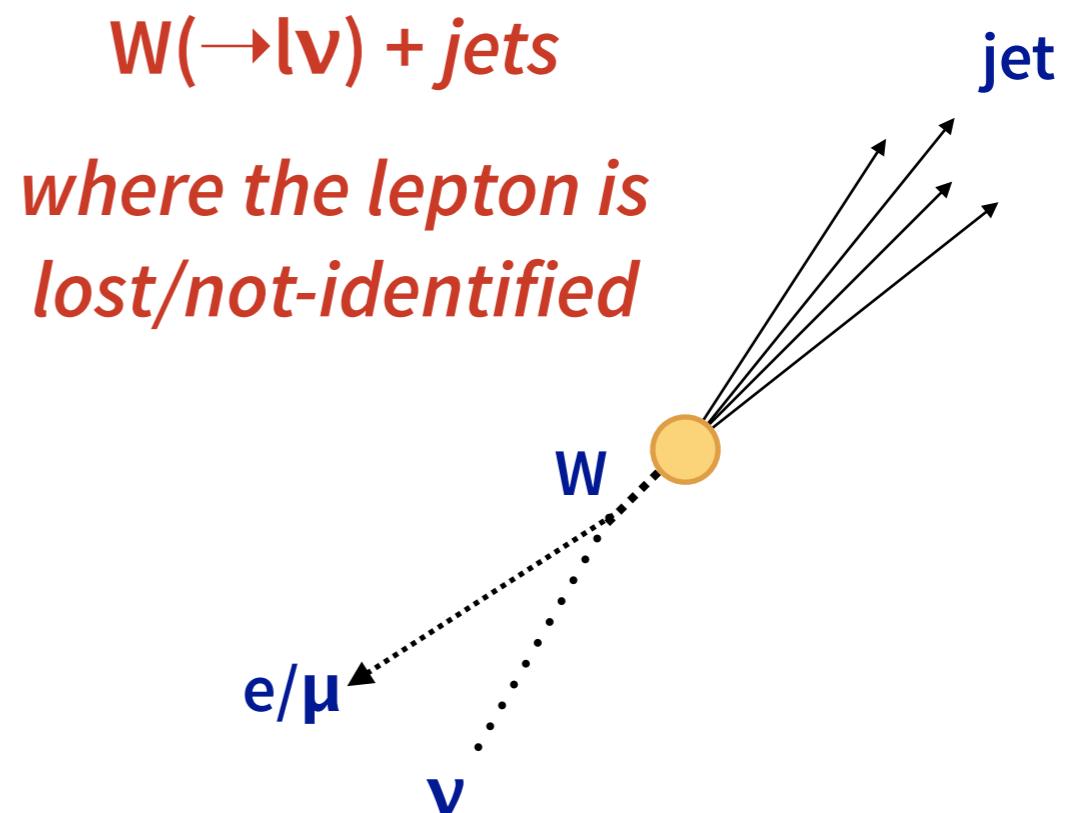

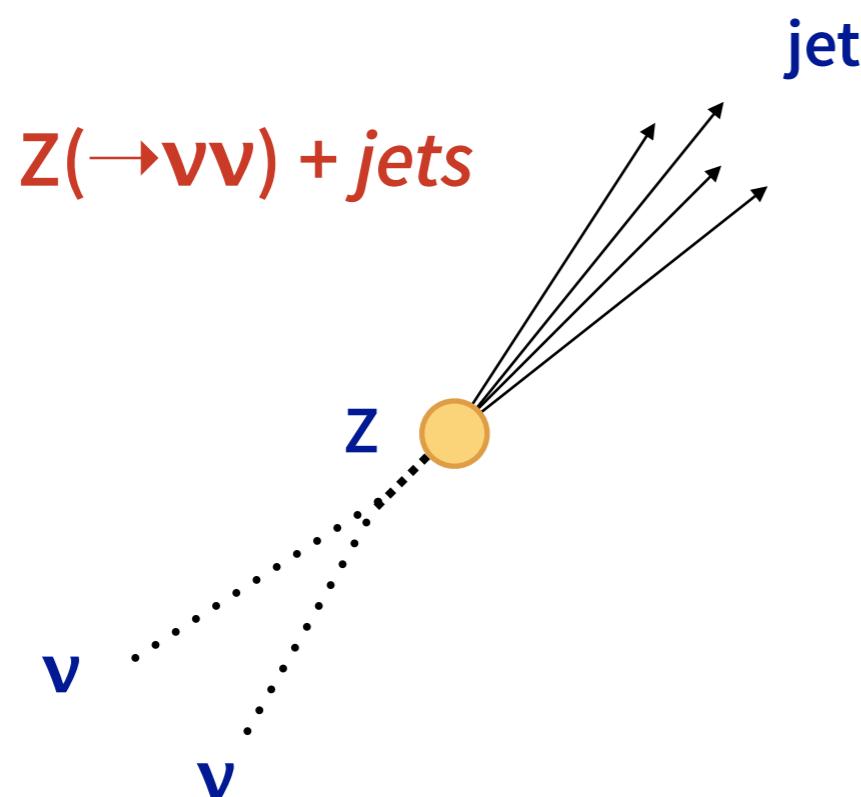

**Analysis performed on 13 TeV and 8 TeV data**

# EWK backgrounds

Dominant backgrounds from EWK processes:

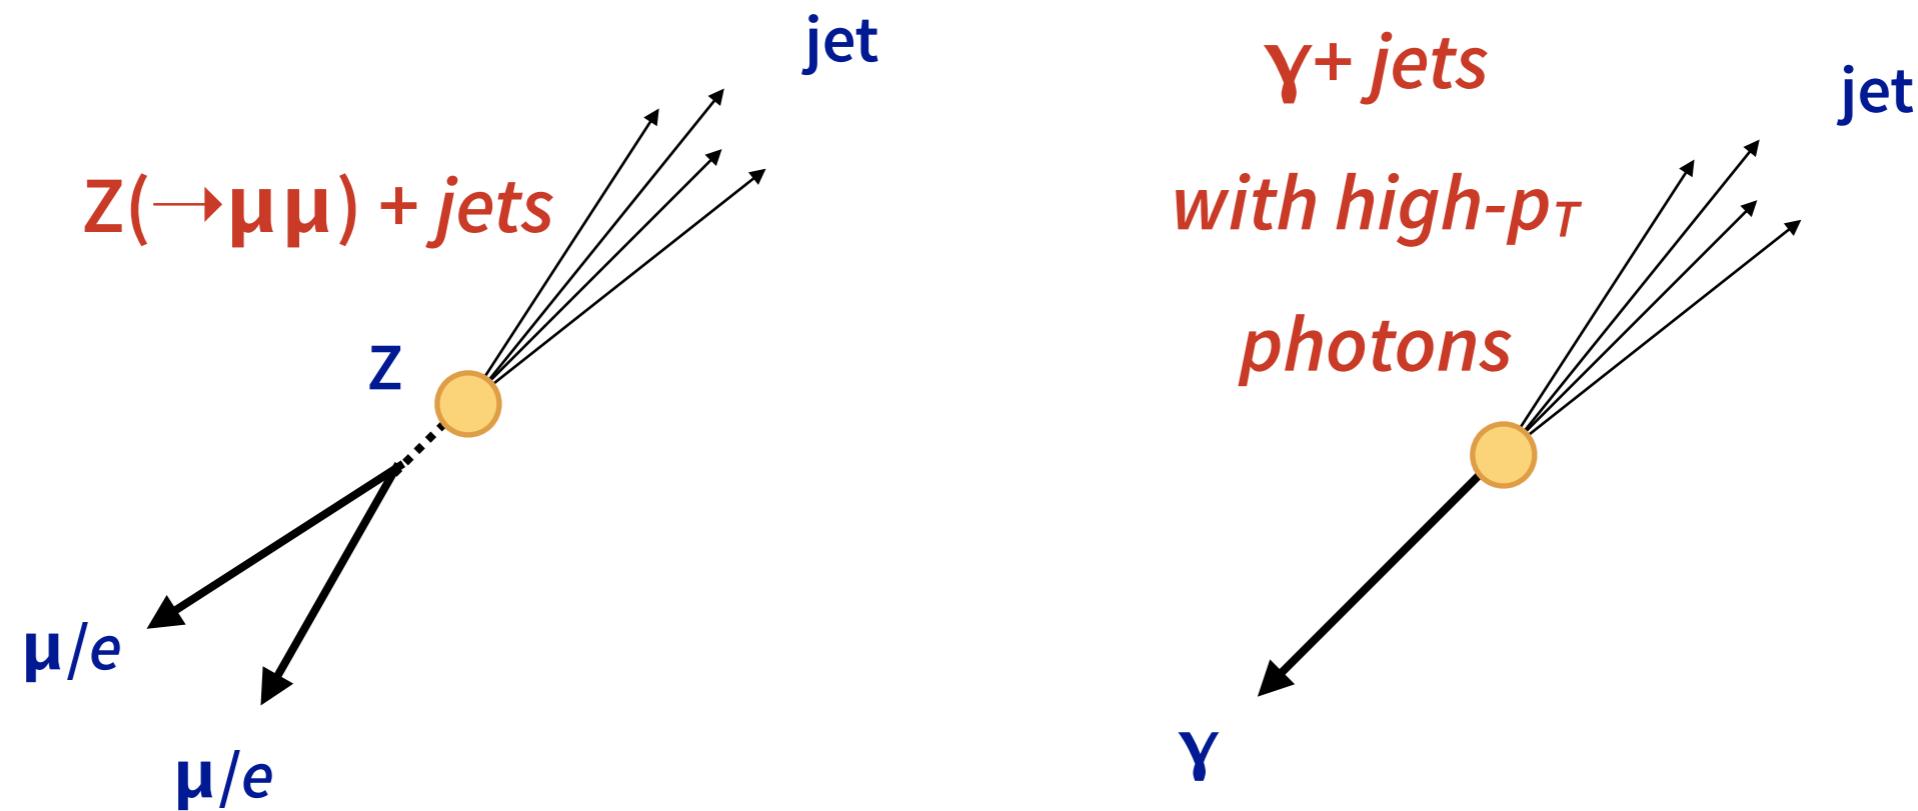

- ▶  $Z(\rightarrow \nu\nu) + \text{jets}$
- ▶  $W(\rightarrow l\nu) + \text{jets}$

# Looking at similar processes?

Background expectation can be determined from data

- ▶ Looking at similar final states
  - $Z(\rightarrow \nu\nu) + jets$ :  $Z(\rightarrow \mu\mu/\text{ee}) + jets$  and  $\gamma + jets$

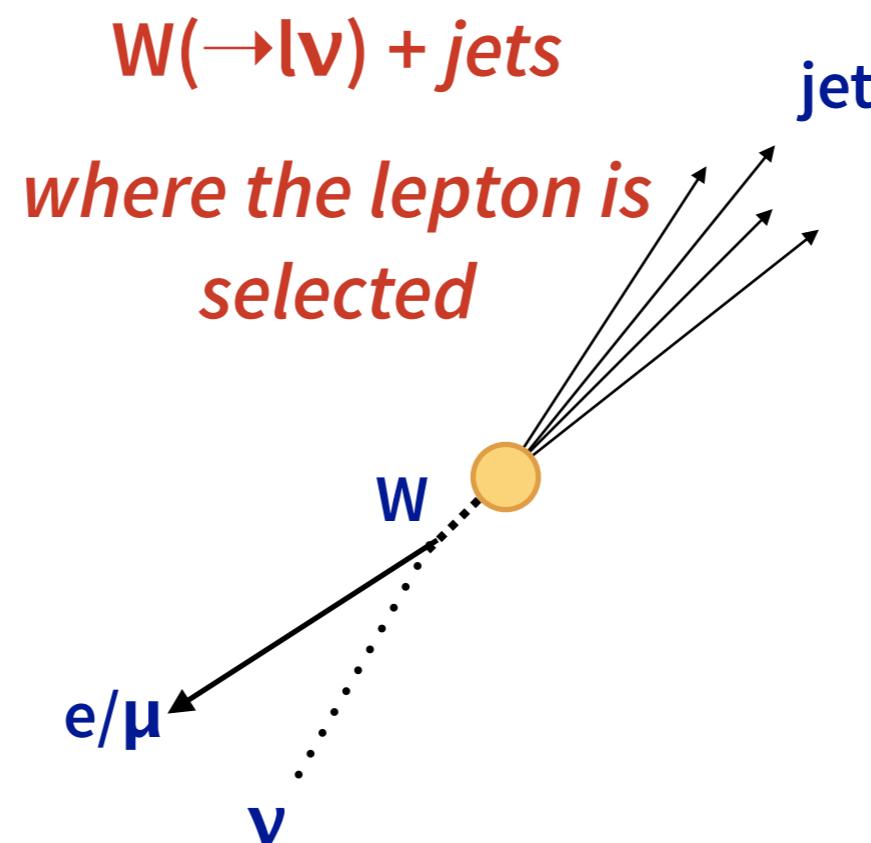

# Looking at similar processes?

Background expectation can be determined from data

► Looking at similar final states

- $Z(\rightarrow \nu\nu) + jets$ :  $Z(\rightarrow \mu\mu/e e) + jets$ ,  $W(\rightarrow \mu/e \nu) + jets$  and  $\gamma + jets$
- $W(\rightarrow \mu/e \nu) + jets$ :  $W(\rightarrow \mu/e \nu) + jets$  with visible lepton

# EWK Background Estimation Procedure

Want to estimate EWK background in the *signal region (SR)*

- Using data-driven techniques to reduce uncertainties

## 1. Definition of control samples (CR) enriched in events from similar processes

- Same selection as in SR except lepton/photon veto is inverted
- Double and single lepton CRs plus photon CR: 5 CRs

## 2. Consider boson recoil ( $W/Z/\gamma$ $p_T$ ) to mimic $E_T^{\text{miss}}$ in SR

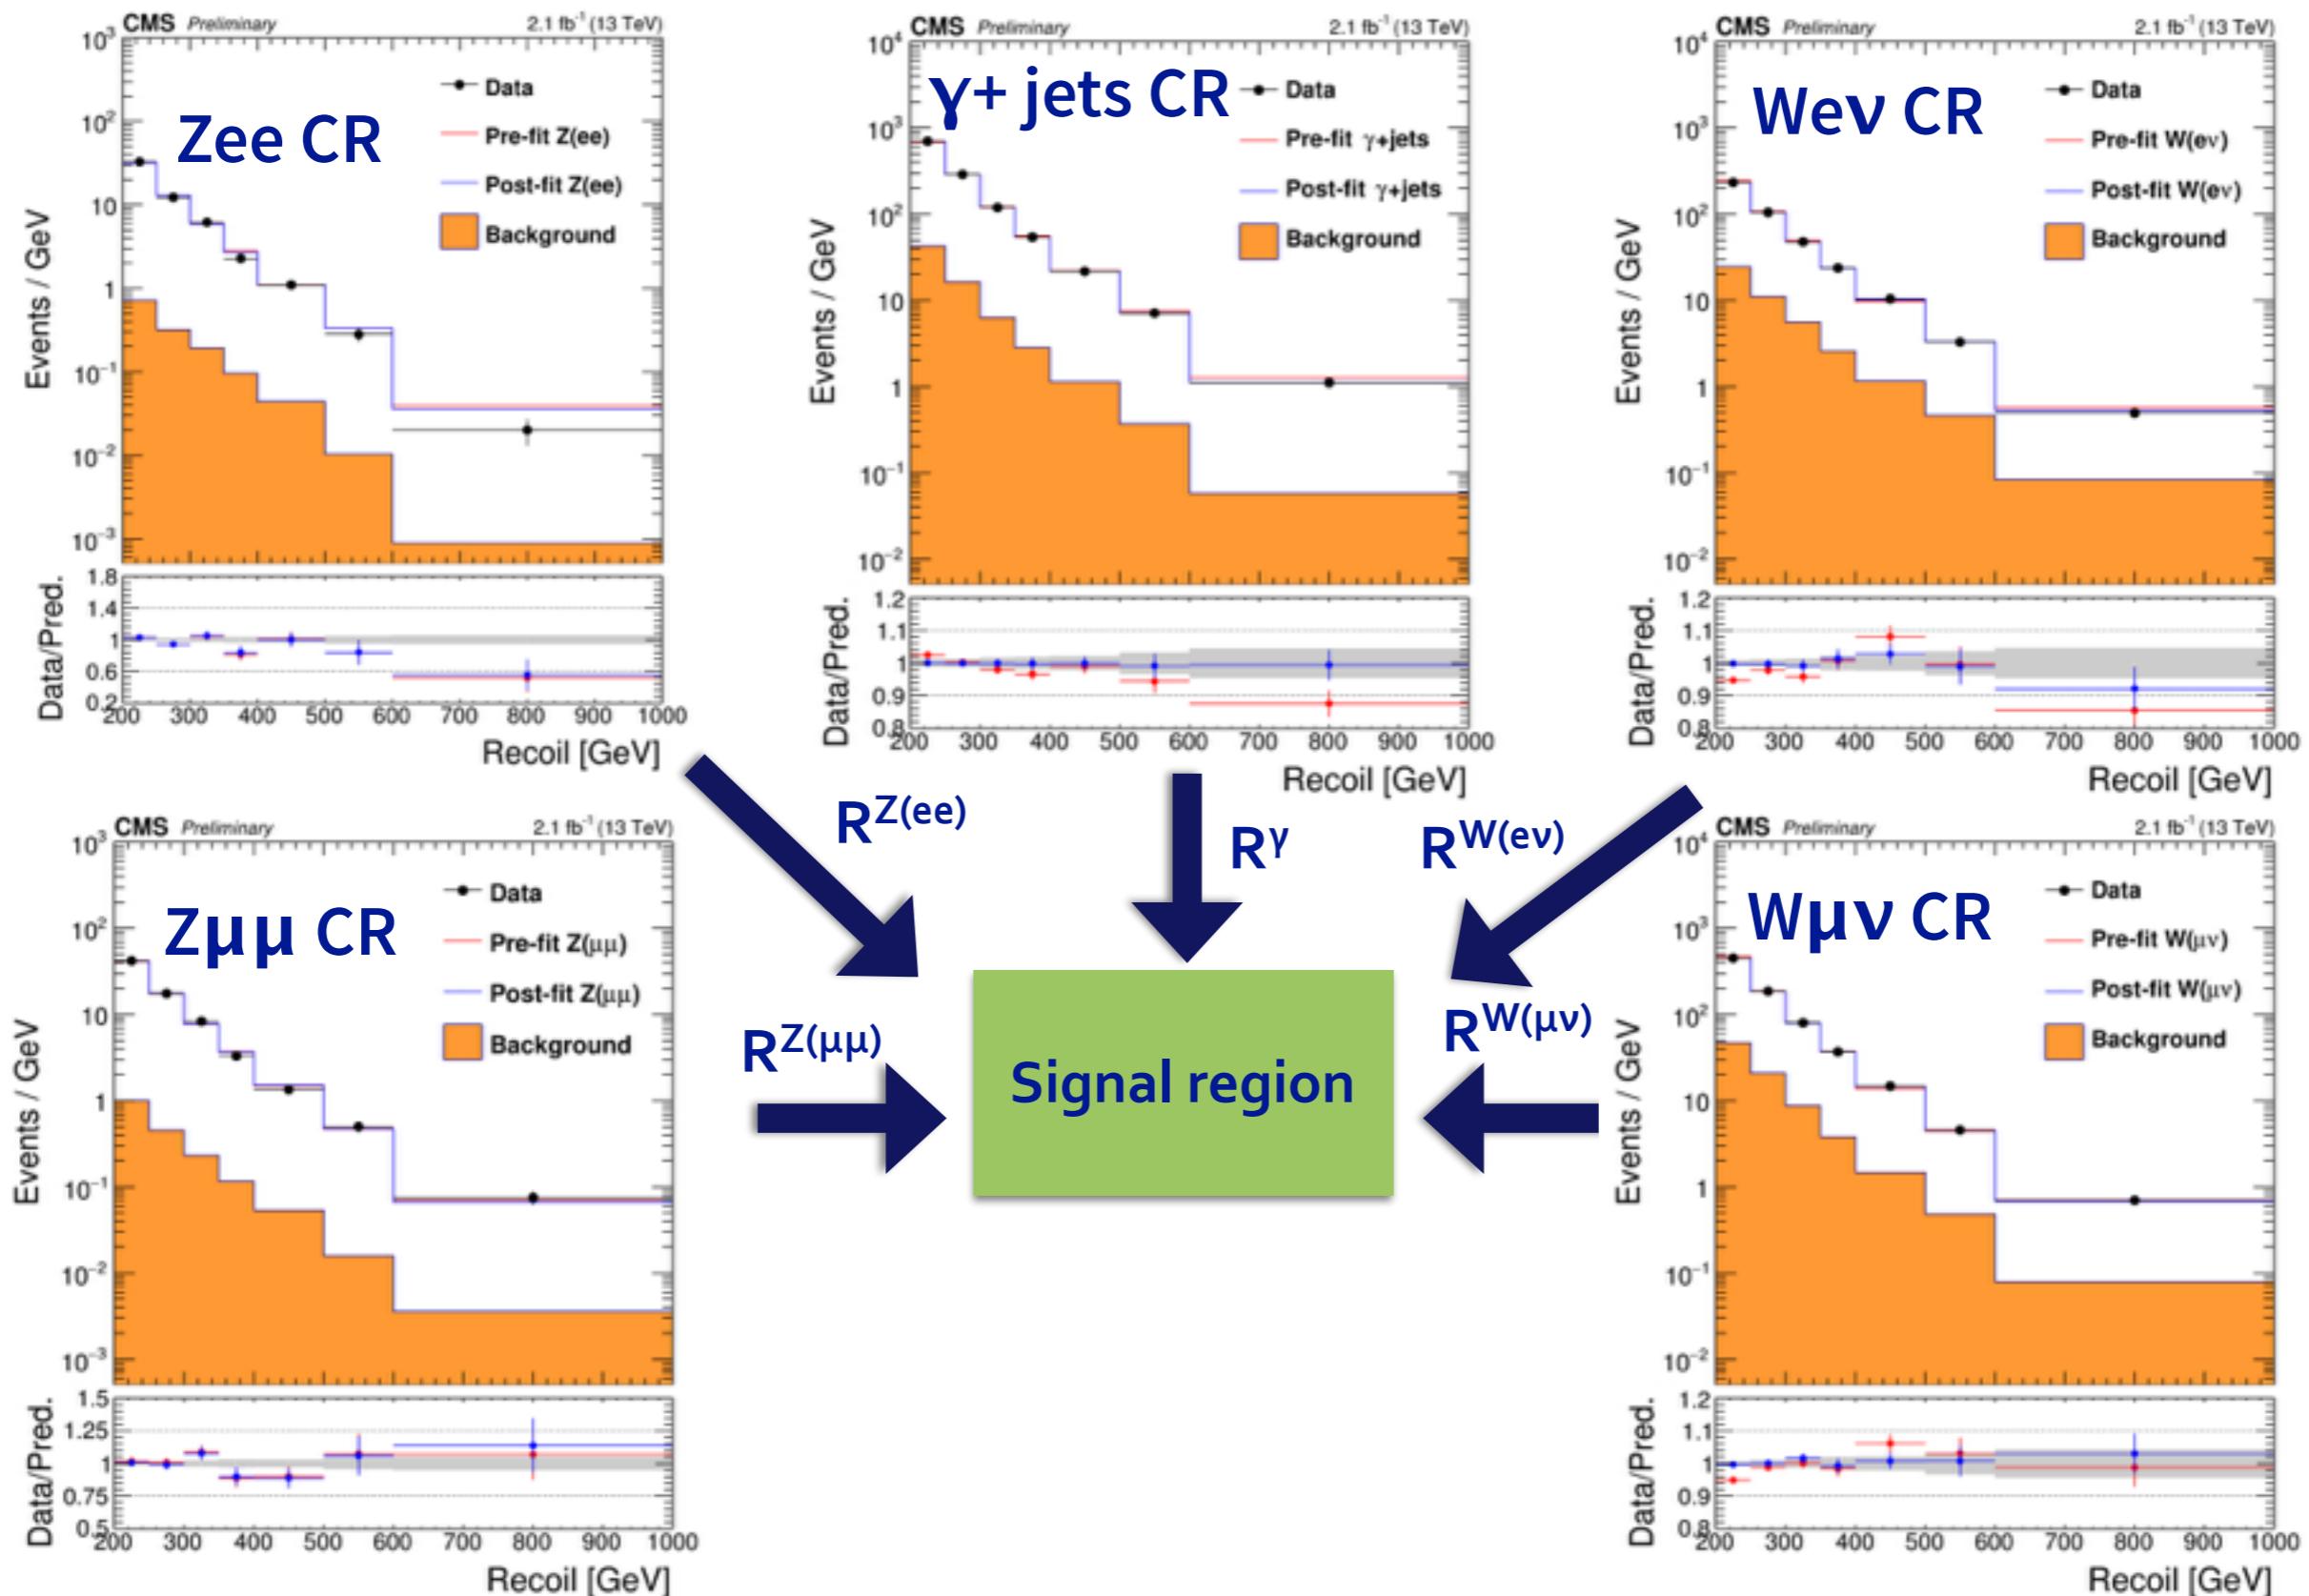

- $Z(\rightarrow ll) + \text{jets}$ :  $p_T^Z = p_T^{l1} + p_T^{l2}$
- $W(\rightarrow lv) + \text{jets}$ :  $p_T^W = p_T^l + p_T^v$
- $\gamma + \text{jets}$ :  $p_T^\gamma$

## 3. Relate CR and SR using bin-by-bin transfer factors “R” from simulation

- $N_i^{Z(\text{SR})} = N_i^{Z(ll)} \times R^{Z(ll)}$
- $N_i^{Z(\text{SR})} = N_i^Y \times R^Y$
- $N_i^{W(\text{SR})} = N_i^{W(lv)} \times R^{W(lv)}$

**R** accounts for cross-section ratio  
and for efficiency and acceptance of  
leptons/photons in CRs

# Control regions

# Fit to signal and control regions

Combined maximum likelihood fit to CRs and SR to estimate  $E_T^{\text{miss}}$  shape  
and normalisation of EWK backgrounds

$$\mathcal{L}(\mu, \mu^{Z \rightarrow \nu\nu}, \mu^{W \rightarrow l\nu}, \theta) = \prod_i \text{Poisson}\left(d_i | B_i(\theta) + \mu_i^{W \rightarrow l\nu} + \mu_i^{Z \rightarrow \nu\nu} + \mu S_i(\theta)\right)$$

*signal*

$$\times \prod_i \text{Poisson}\left(d_i^Z | B_i^Z(\theta) + \frac{\mu_i^{Z \rightarrow \nu\nu}}{R_i^Z(\theta)}\right) \quad \textcolor{violet}{dilepton}$$
$$\times \prod_i \text{Poisson}\left(d_i^\gamma | B_i^\gamma(\theta) + \frac{\mu_i^{Z \rightarrow \nu\nu}}{R_i^\gamma(\theta)}\right) \quad \textcolor{brown}{photon}$$
$$\times \prod_i \text{Poisson}\left(d_i^W | B_i^W(\theta) + \frac{\mu_i^{W \rightarrow l\nu}}{R_i^W(\theta)}\right) \quad \textcolor{blue}{single lepton}$$

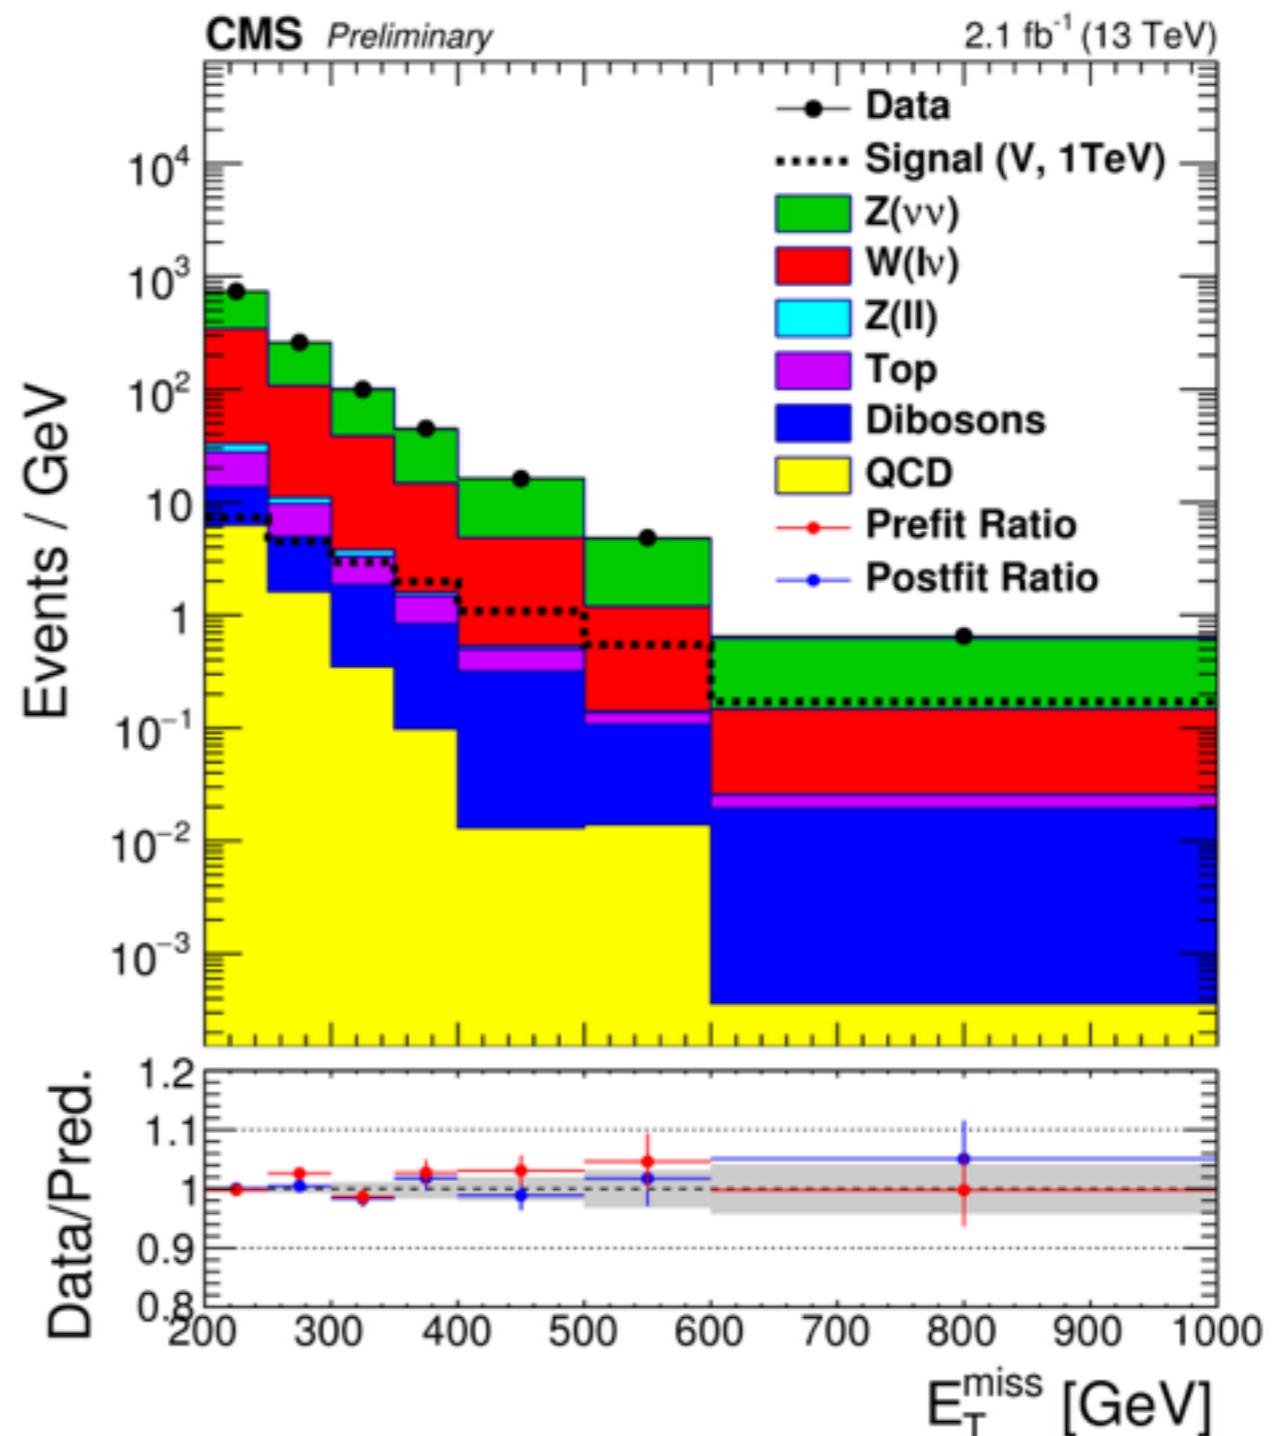

Z( $\rightarrow \nu\nu$ ) + jets and W( $\rightarrow \mu/e \nu$ ) + jets estimates further constrained by  
Z/W cross-section ratio

$$\mu^{W \rightarrow l\nu} \rightarrow f_i(\theta) \cdot \mu^{Z \rightarrow \nu\nu}$$

# $E_T^{\text{miss}}$ distribution in signal region

CMS PAS EXO-15-003

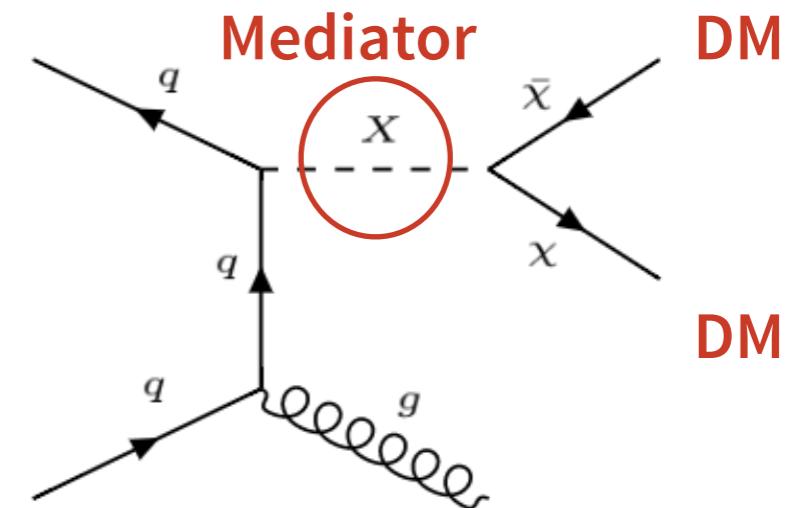

- ▶ Subdominant background contributions from
  - Top, diboson and QCD multijet events
  - Estimated from simulation
- ▶ Overall good agreement post fit (blue dots)
- ▶ Uncertainties get constrained from data in control regions as well as in signal region

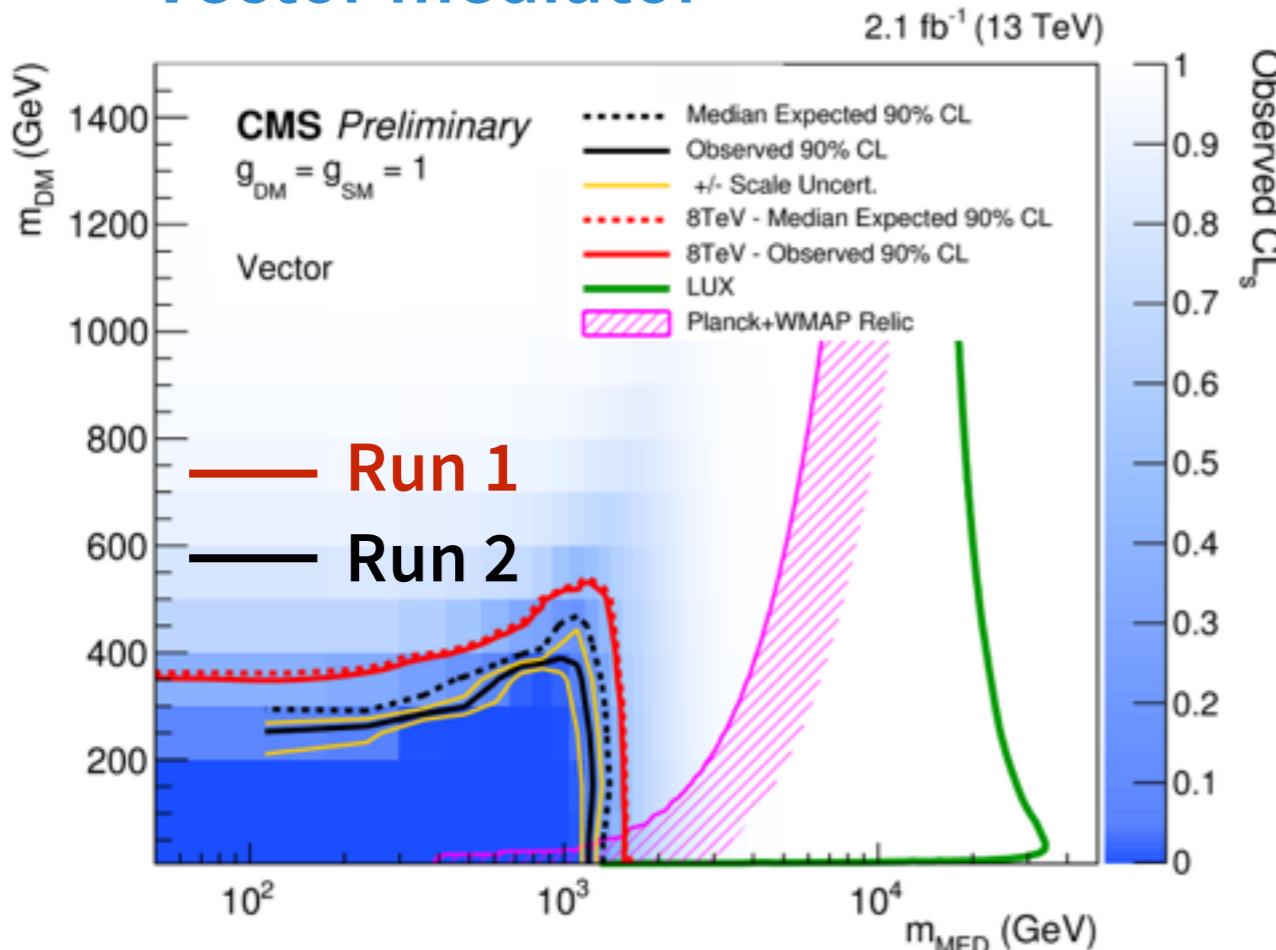

# Interpretation

## ► Interpretation in terms of simplified models:

- Limits on production  $\sigma$  set as a function of:
  - $m_{\text{DM}}$  and  $m_{\text{MED}}$

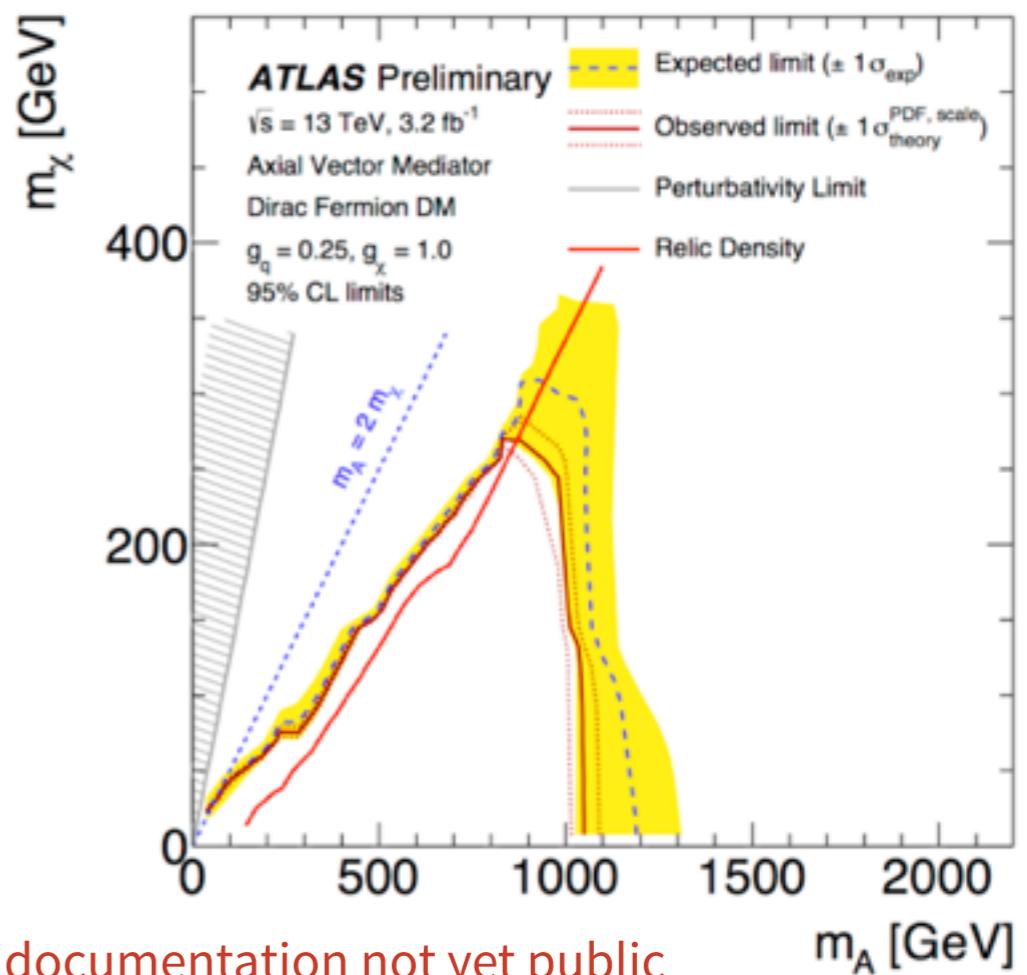

### Vector mediator

CMS PAS EXO-15-003

### Axial-Vector mediator

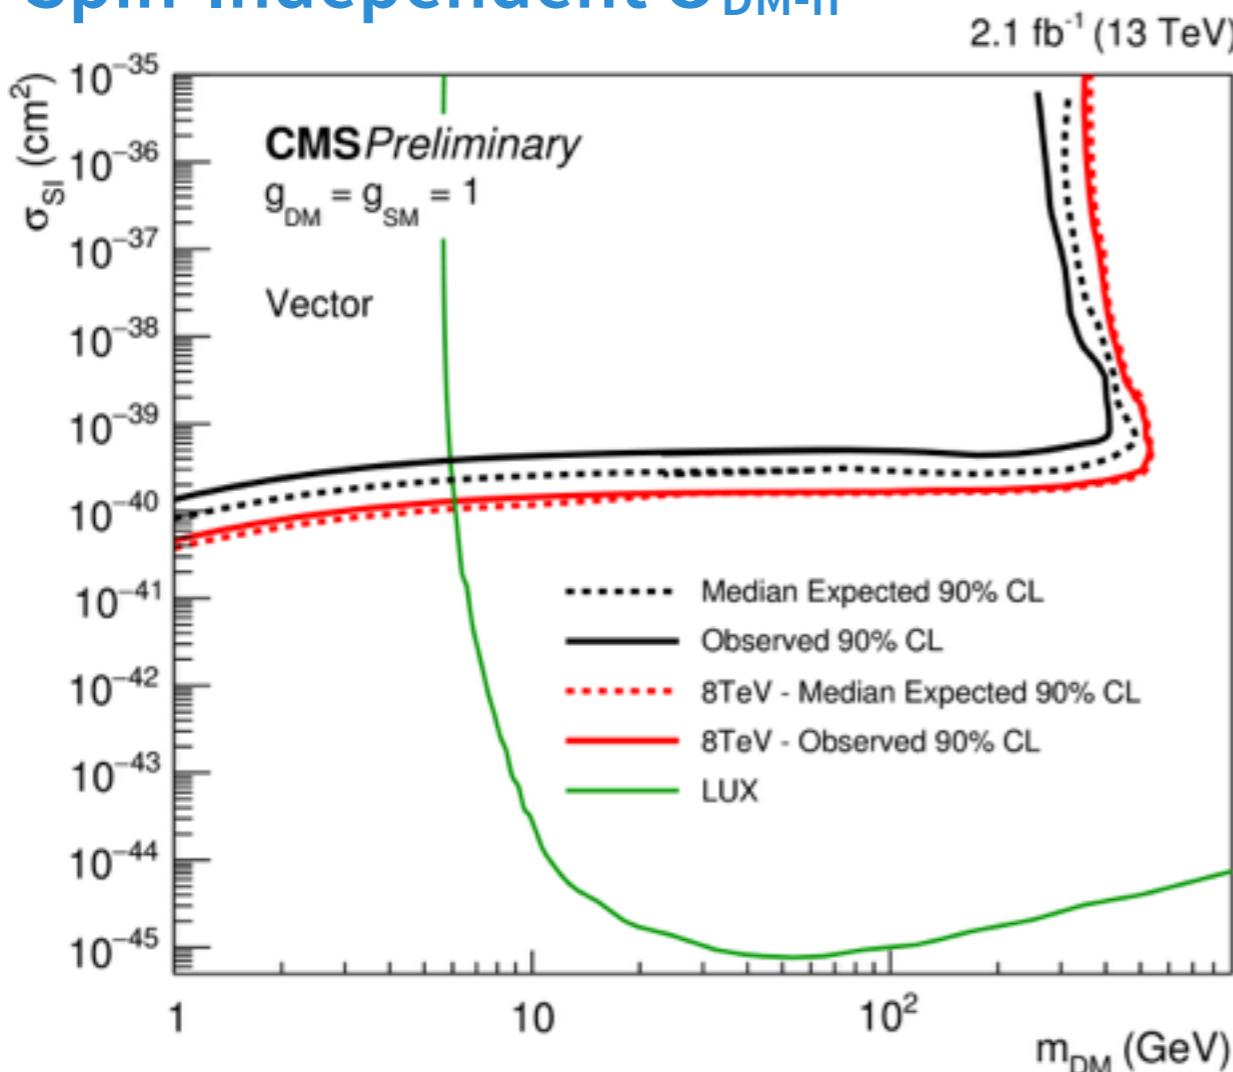

ATLAS documentation not yet public

# Interpretation

Limits recast in terms of DM-nucleon cross section

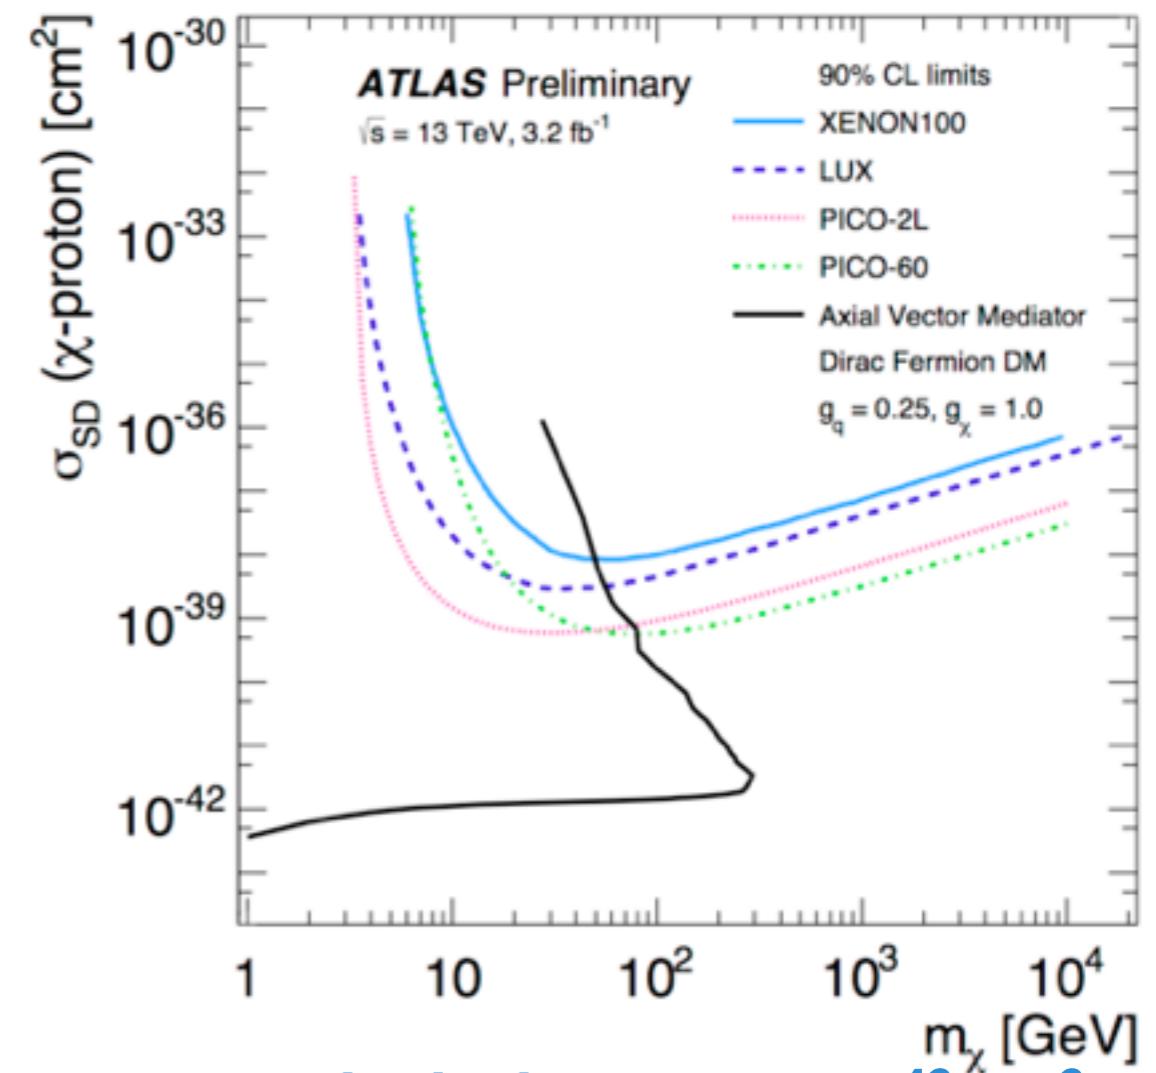

## Spin-Independent $\sigma_{\text{DM}-n}$

Excluded  $\sigma_{\text{DM}-n} > 10^{-41} \text{ cm}^2$   
for low  $m_{\text{DM}}$

CMS PAS EXO-15-003

## Spin-Dependent $\sigma_{\text{DM}-n}$

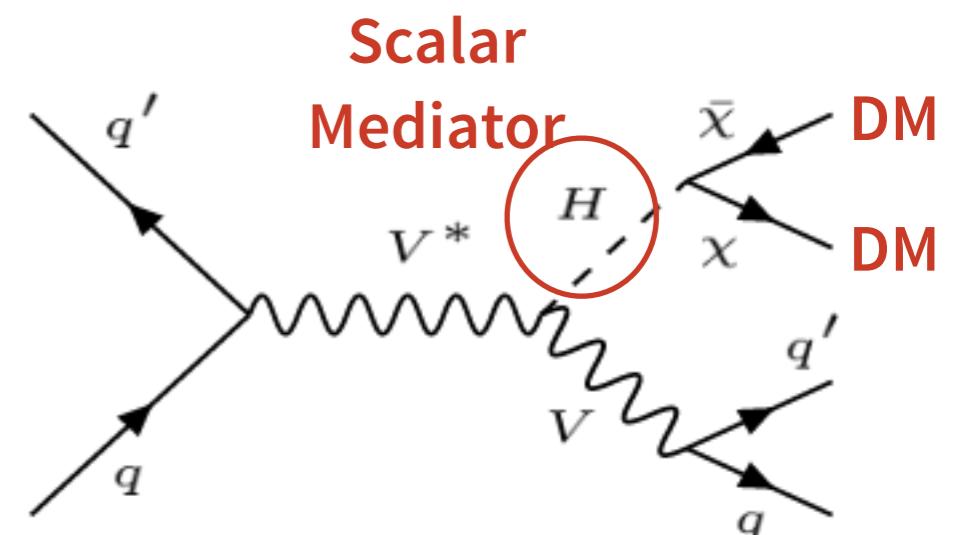

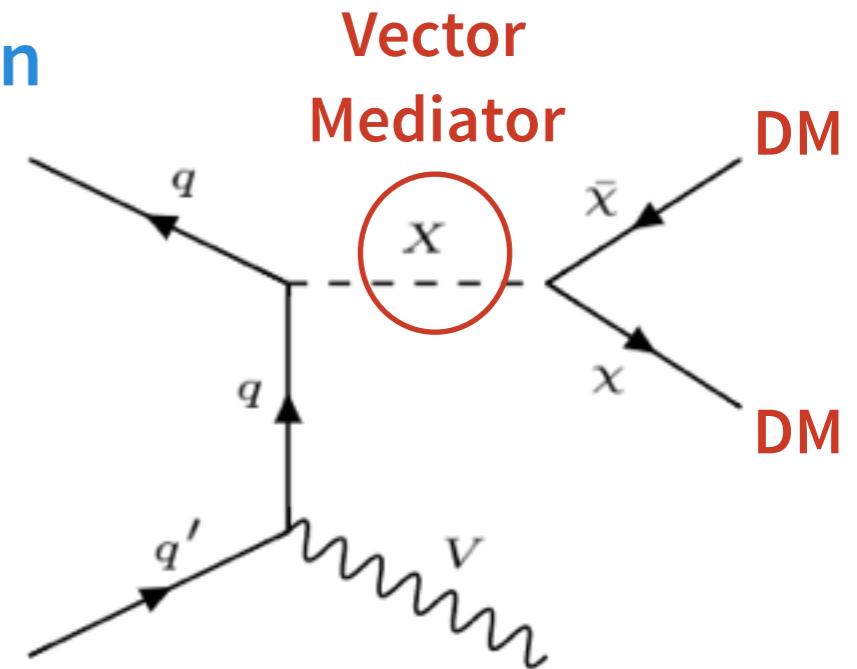

Excluded  $\sigma_{\text{DM}-n} > 10^{-42} \text{ cm}^2$   
for low  $m_{\text{DM}}$

ATLAS documentation not yet public

# What about V + DM?

DM can be produced in association to a W/Z boson

- ▶ Lower  $\sigma$  but also lower backgrounds wrt Jet +  $E_T^{\text{miss}}$
- ▶ V boson recoiling against high  $E_T^{\text{miss}}$
- ▶ 2 possible decay channels:
  - Leptonic and Hadronic
- ▶ Search strategy based on **V reconstruction**
  - Strongly depends on decay channel
    - Leptonic V reconstruction from leptons
    - Hadronic V reconstruction from jets in low/high  $p_T$  regime
- ▶ Backgrounds estimation
  - From data similarly to Monojet

SM Higgs-stralung with invisible  
Higgs decay mode

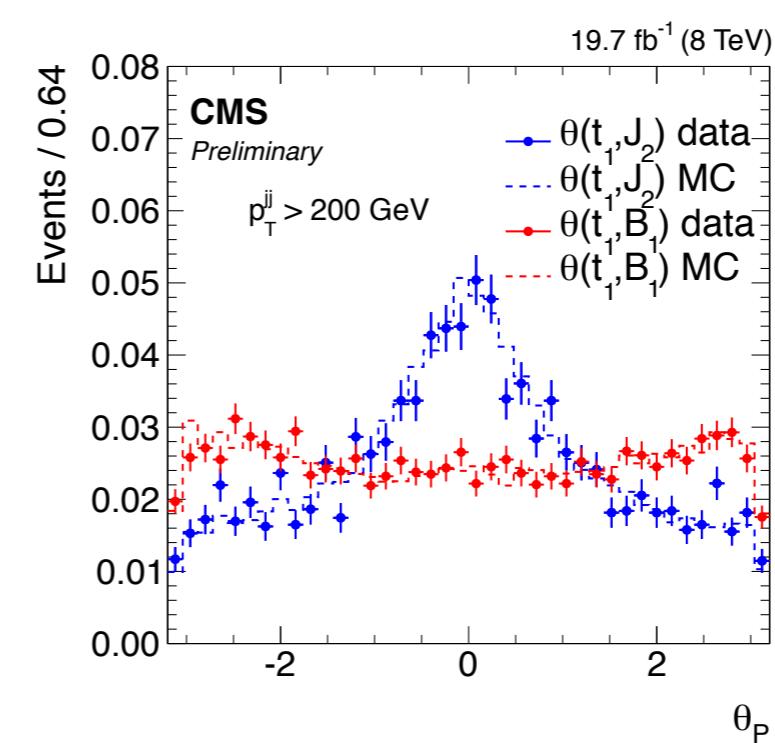

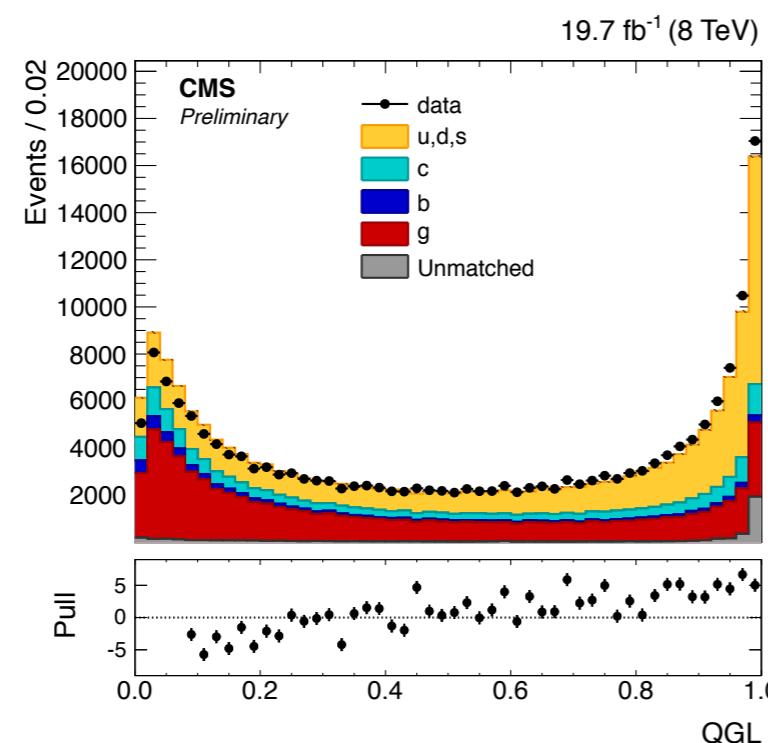

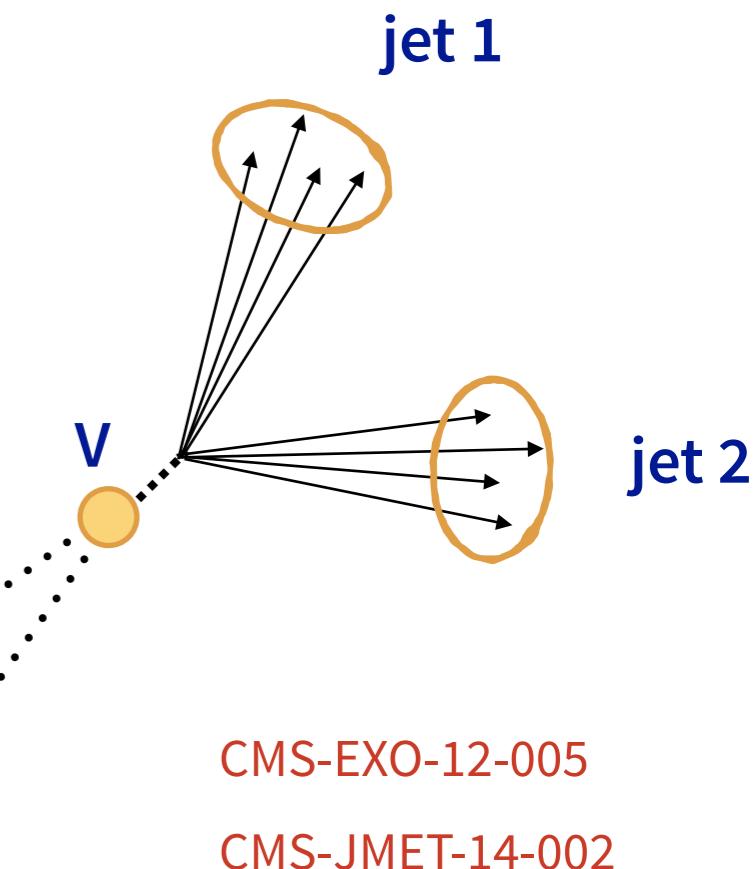

# Low $p_T$ V (hadronic decay)

Low  $V p_T$ :  $V \rightarrow jj$  decay fully reconstructed

- $V$  decay products emerged as two distinct jets
- Multivariate discriminator based on jet and di-jet properties, e.g:
  - $m_{jj}$  consistent with  $V$  boson mass
  - Jet Quark-Gluon likelihood (QGL)
  - Color flow

} **V tagging**

DM  
DM

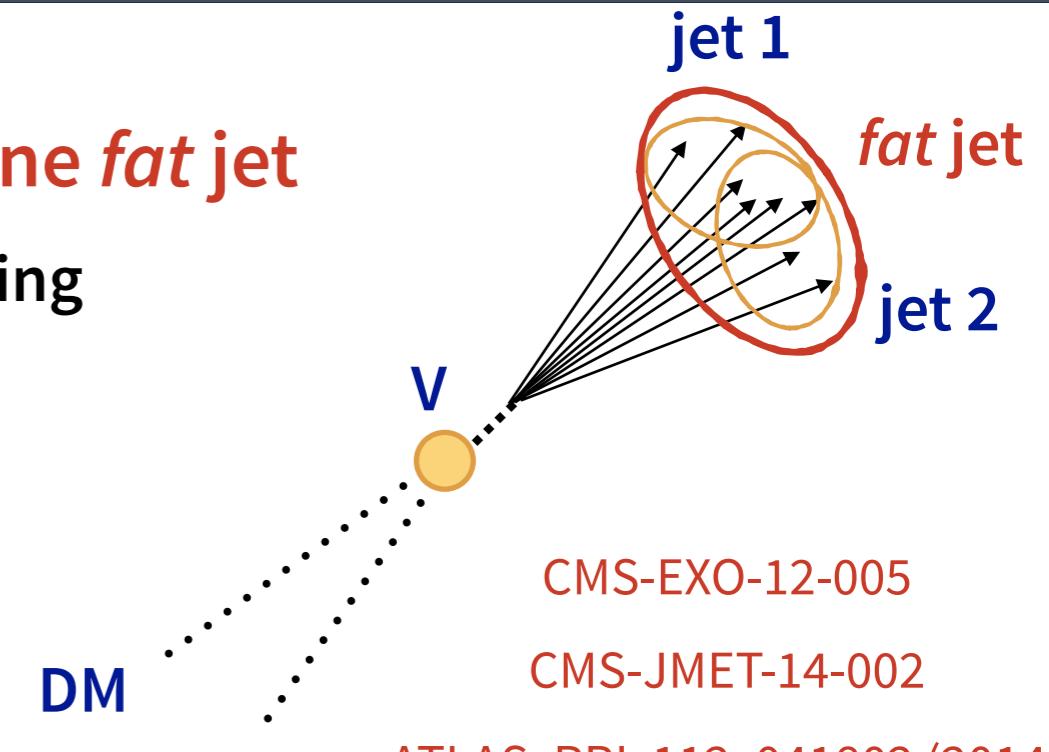

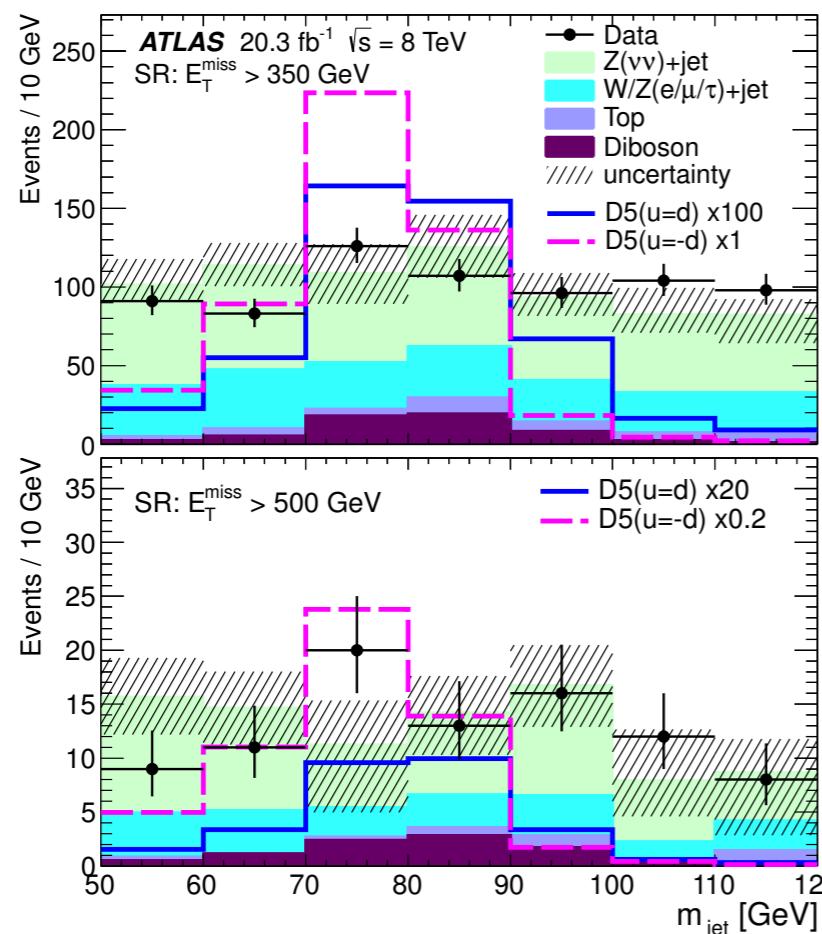

# High $p_T$ V (hadronic decay)

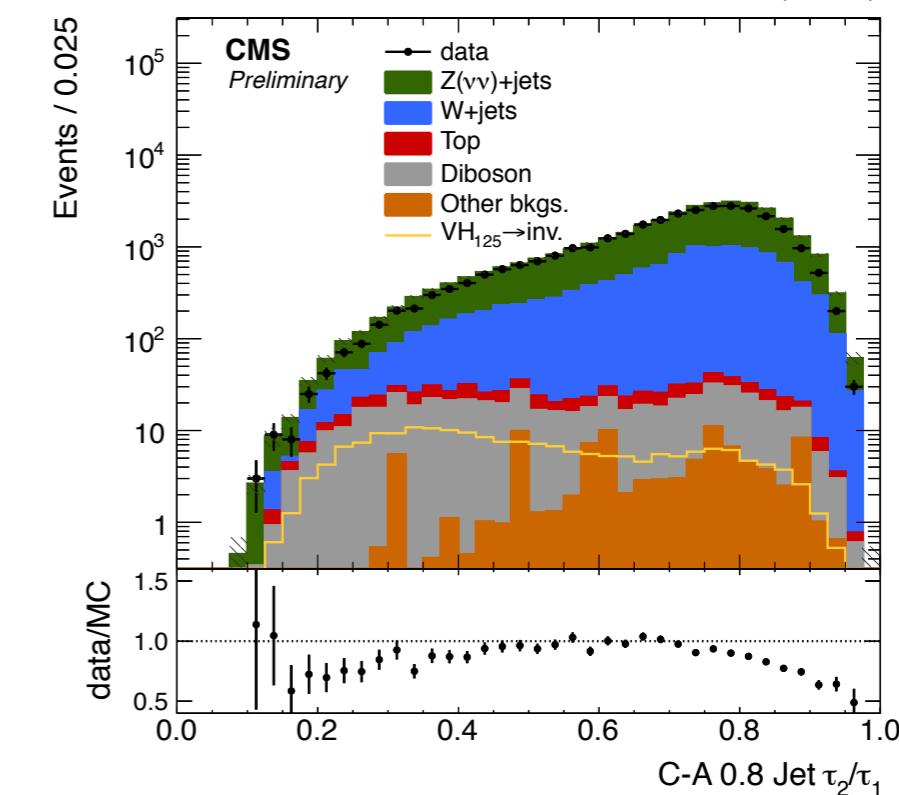

**High  $V p_T$ :  $V \rightarrow jj$  decay products merged in one *fat jet***

► Substructure techniques employed:  $V$  boson tagging

- 1 central, high  $p_T$  fat jet with  $m_j$  compatible with  $V$  boson mass [ATLAS & CMS]
- Fat jet likely to be originated from 2 jets, N-subjettiness [CMS]

DM  
ATLAS, PRL 112, 041802 (2014)

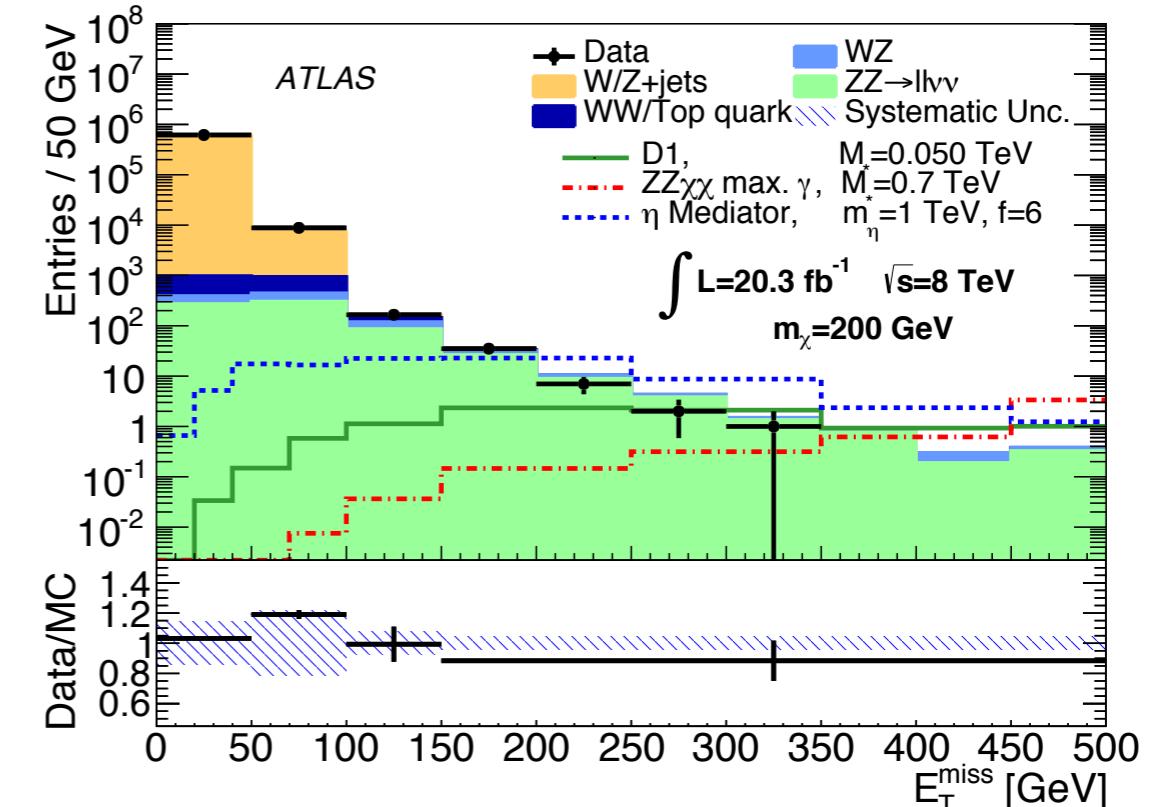

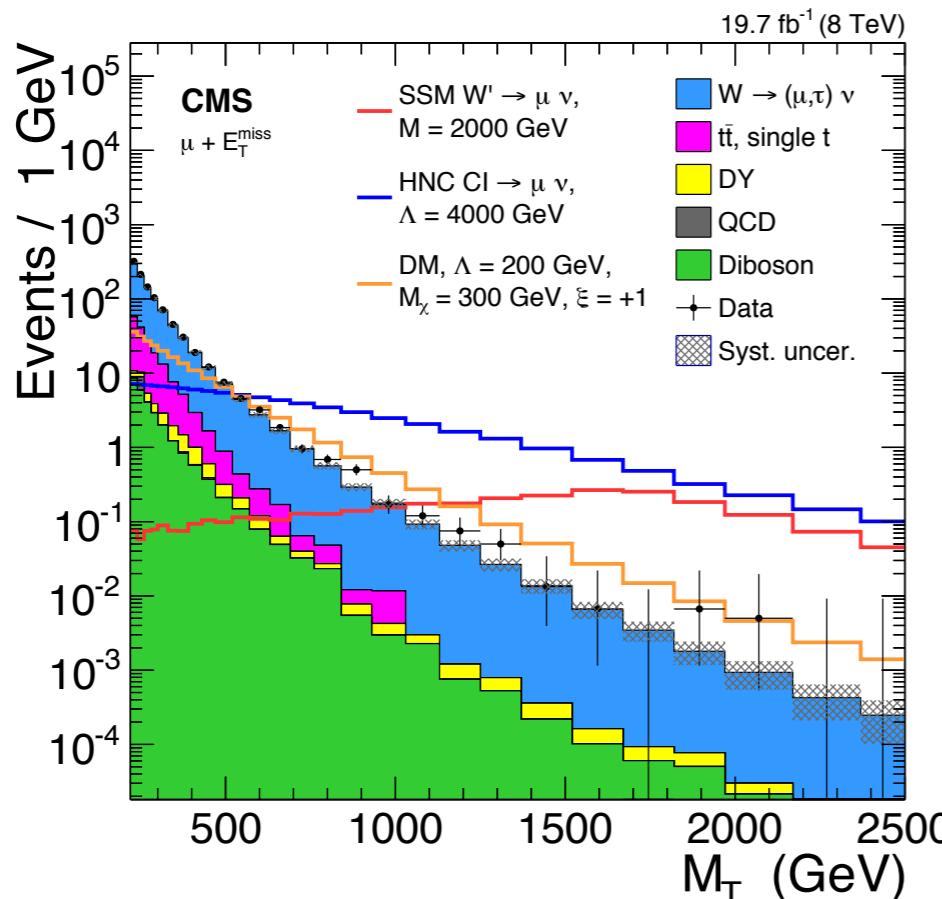

# What about leptonic V?

## $W(\rightarrow l \nu) + DM$

- ▶ 1 isolated, high  $p_T$  lepton and high  $E_T^{\text{miss}}$
- ▶  $W$  not fully reconstructable
  - Transverse mass,  $M_T$

$$M_T = \sqrt{2 p_T^{\text{lep}} E_T^{\text{miss}} (1 - \cos(\Delta\phi))}$$

CMS, PRD 91, 092005 (2015) / ATLAS, JHEP 09 (2014) 037

## $Z(\rightarrow l l) + DM$

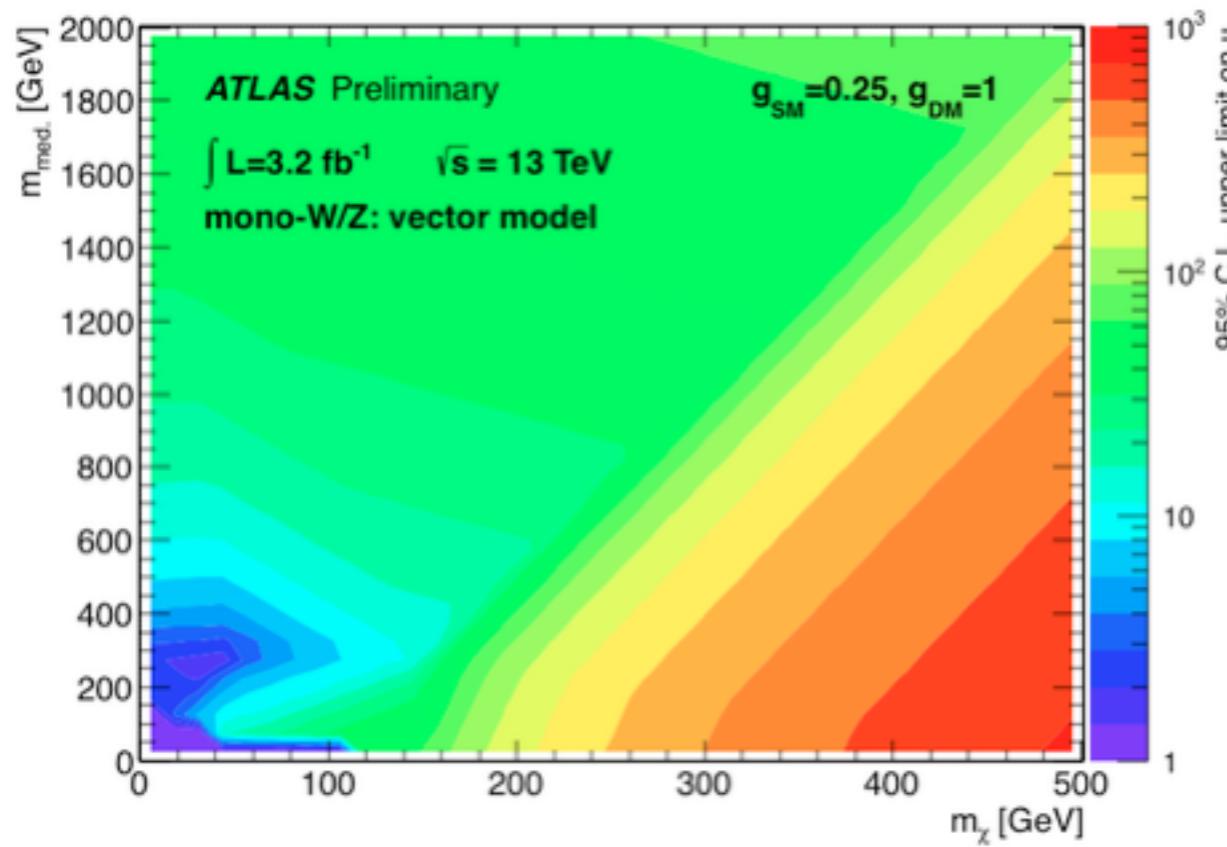

- ▶  $Z$  reconstructed from 2 opposite-charge same-flavour leptons
- ▶ ATLAS looks for signal events in the tails of  $E_T^{\text{miss}}$  spectrum, CMS looks at  $M_T$

CMS-EXO-12-054 / ATLAS, PRD 90, 012004 (2014)

- ▶ Minor contributions from

- SingleTop, Dibosons, QCD

**QCD and tt + jets suppression  
through selection on  $\Delta\Phi(j, E_T^{\text{miss}})$**

$\Delta\Phi(j, E_T^{\text{miss}})$  useful to reject dileptonic  
tt+jets events also in single-lepton channel

# Analysis Strategy: Hadronic channel

## Signal selection

- ▶ At least 4 jets
  - out of which 2 b-tagged

- ▶ Veto on leptons

- ▶ Large  $E_T^{\text{miss}}$

## Background contamination

- ▶ Dominant backgrounds from

- tt+jets (1l),  $W(\rightarrow l\nu)/Z(\rightarrow \nu\nu) + \text{jets}$

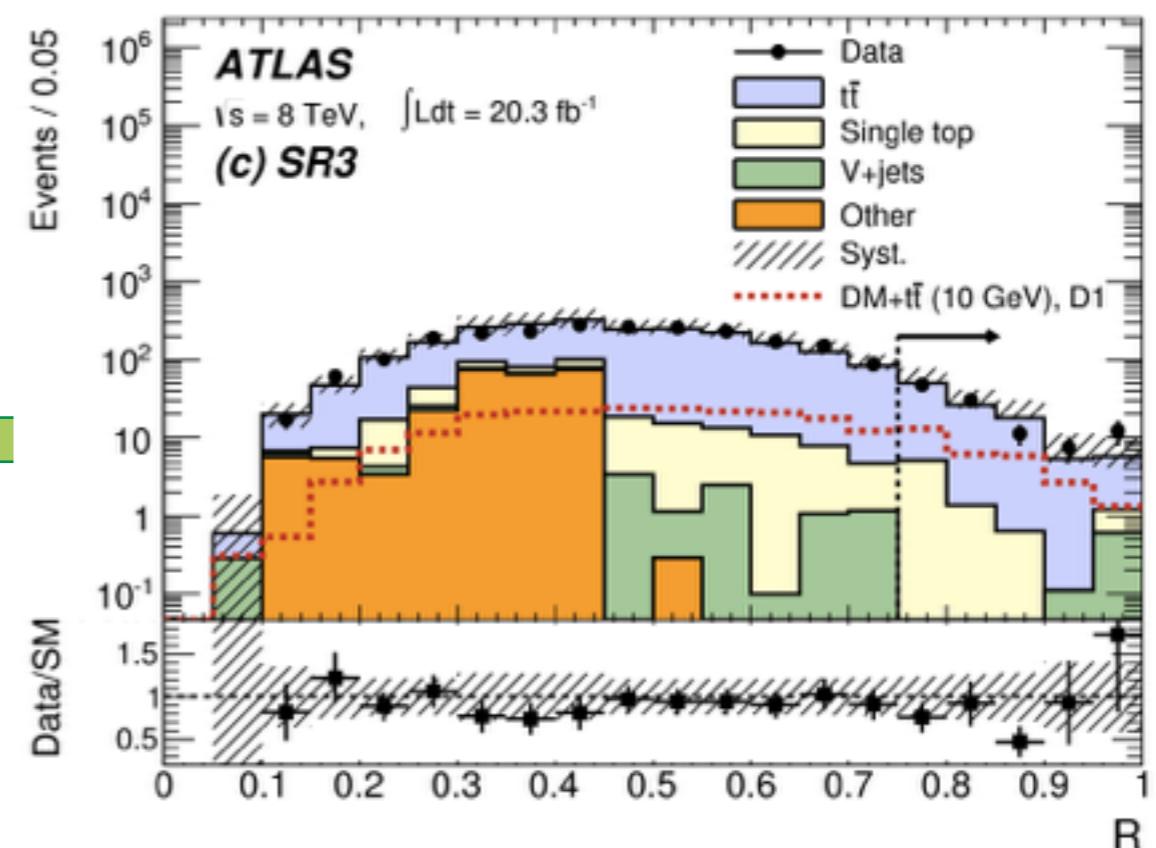

- ▶ Minor contributions from

- SingleTop, Dibosons, QCD

## tt + jets suppression

## through selection on Razor variables

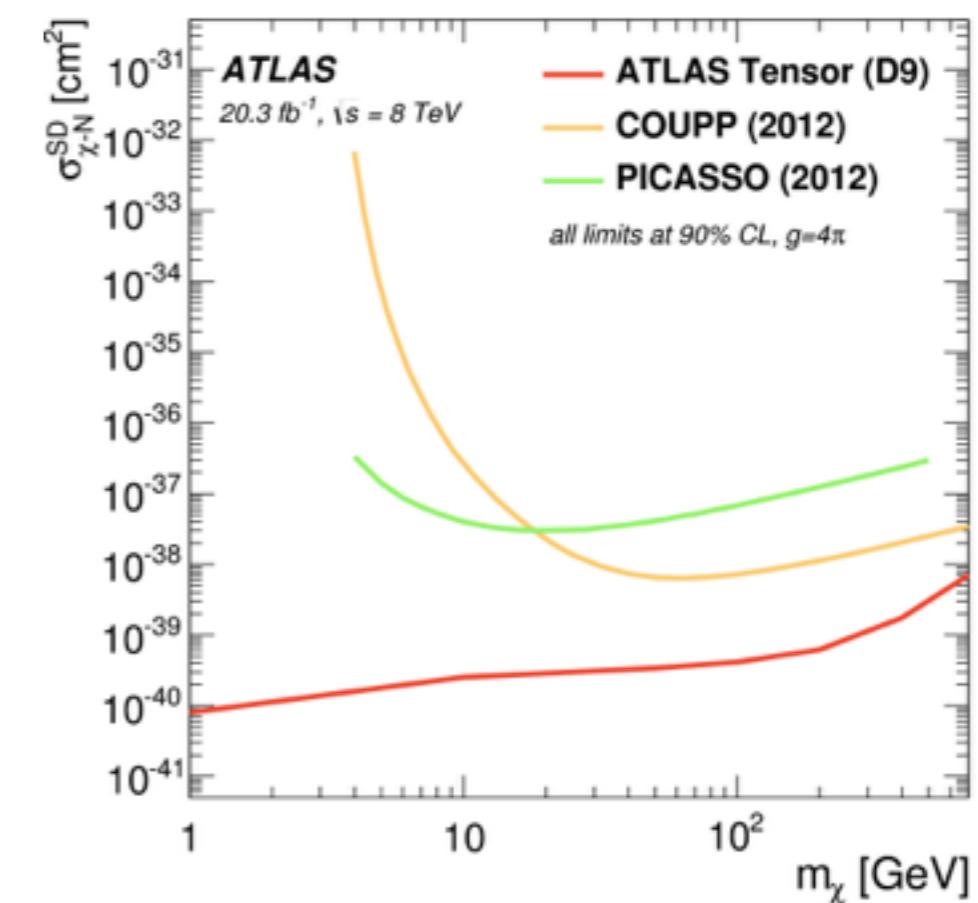

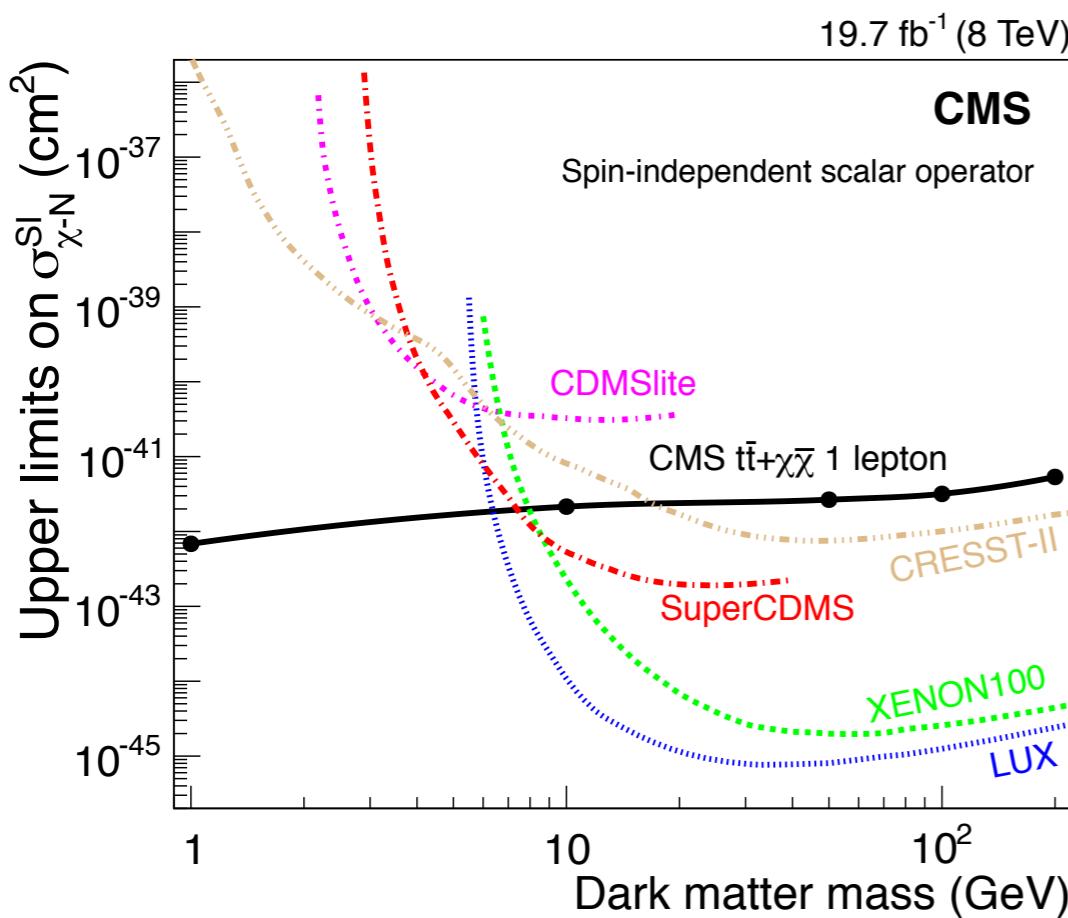

Razor variables use both transverse and longitudinal information about the event, to fully exploit the kinematics of the decay

# Results from tt + DM search

► Up so far: **results from 8 TeV published by both collaborations**

- Effective Field theory approach used for results interpretation
  - Major sensitivity to Scalar/Pseudoscalar interactions
- Set limits on DM-nucleon elastic scattering cross section, as a function od M<sub>DM</sub>
- Collider searches more sensitive at low M<sub>DM</sub>

# DM plus bottom quarks

CMS PAS B2G-15-007

## DM production in association with b quarks

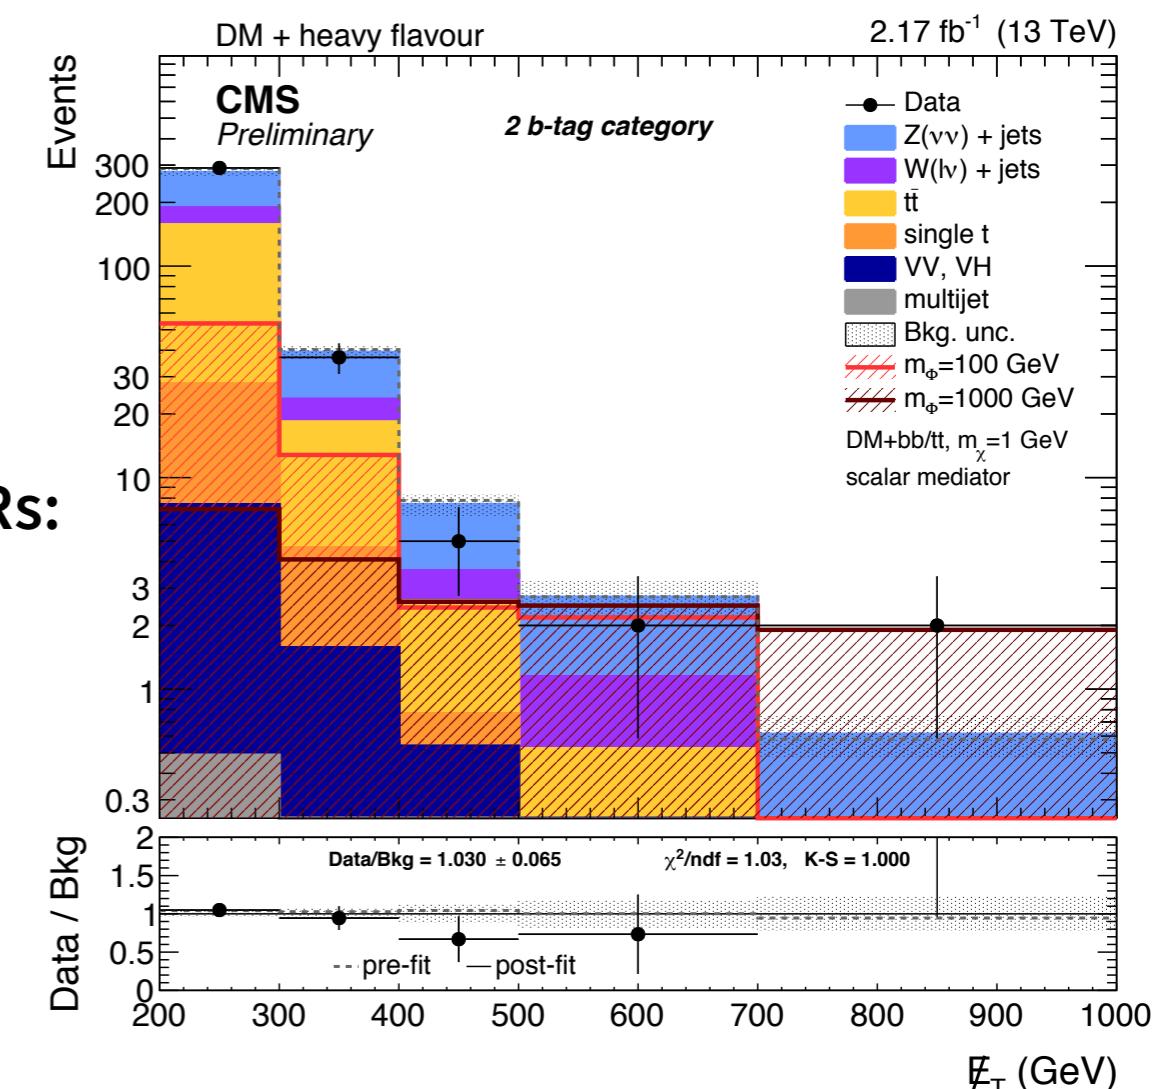

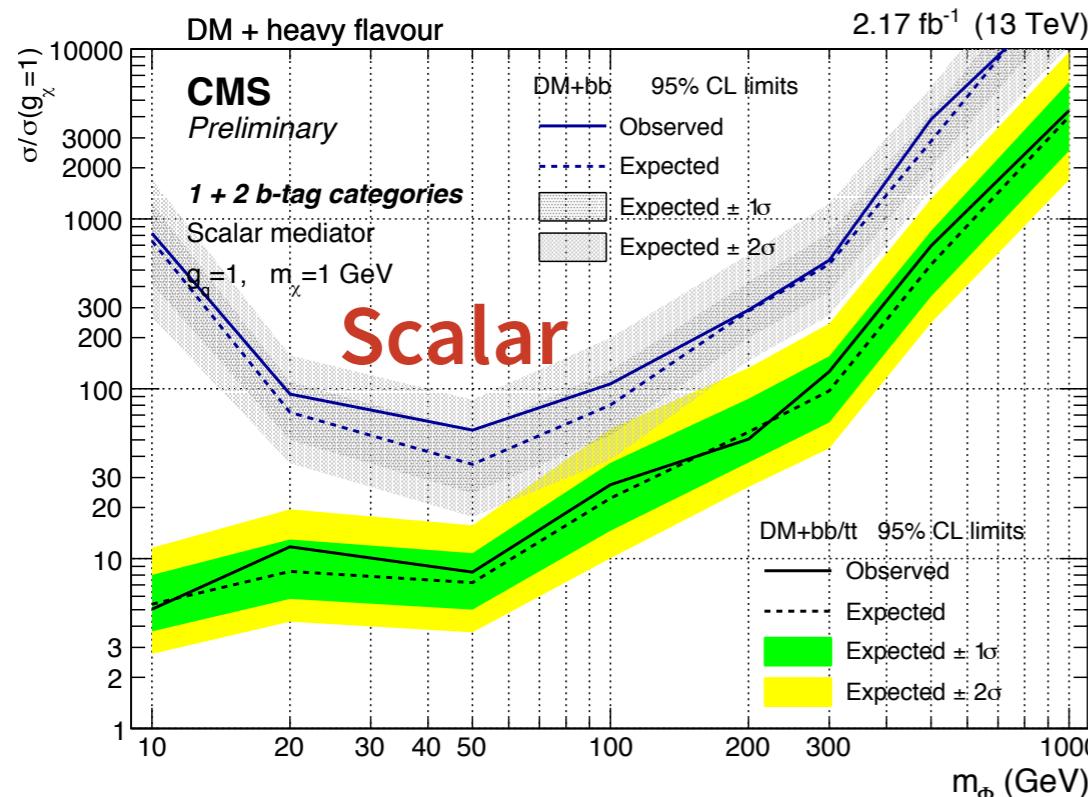

### ► Signal characterisation : $E_T^{\text{miss}} + \text{b-quarks}$

- 2 categories of signal-like events:
  - based on jet and b-tag multiplicity

### ► Signal extraction from $E_T^{\text{miss}}$ distribution

### ► Main backgrounds derived from leptonic CRs:

- $Z(\rightarrow \nu\nu) + \text{jets}, W(\rightarrow l\nu) + \text{jets}, \text{ttbar}$

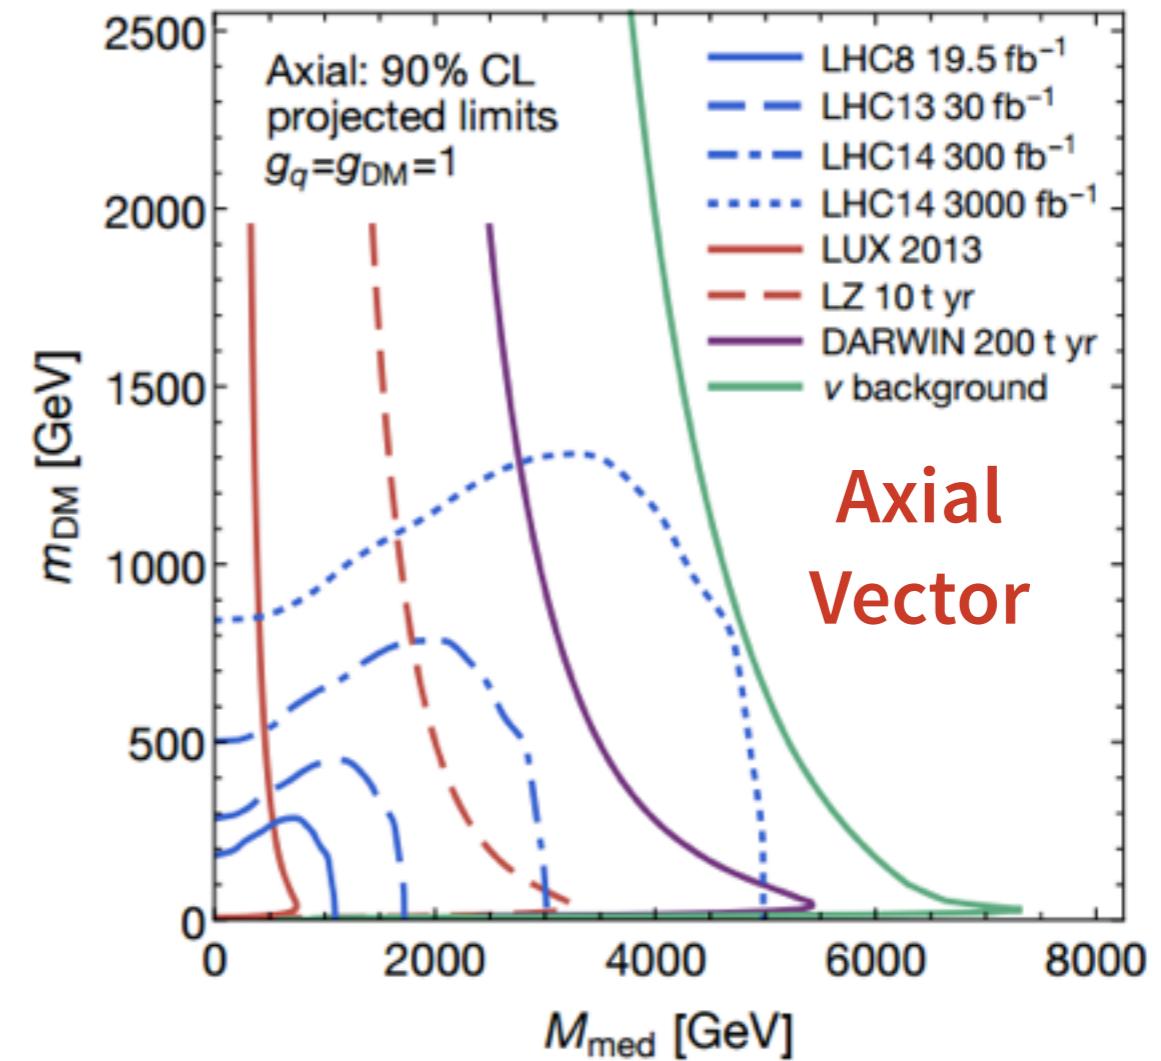

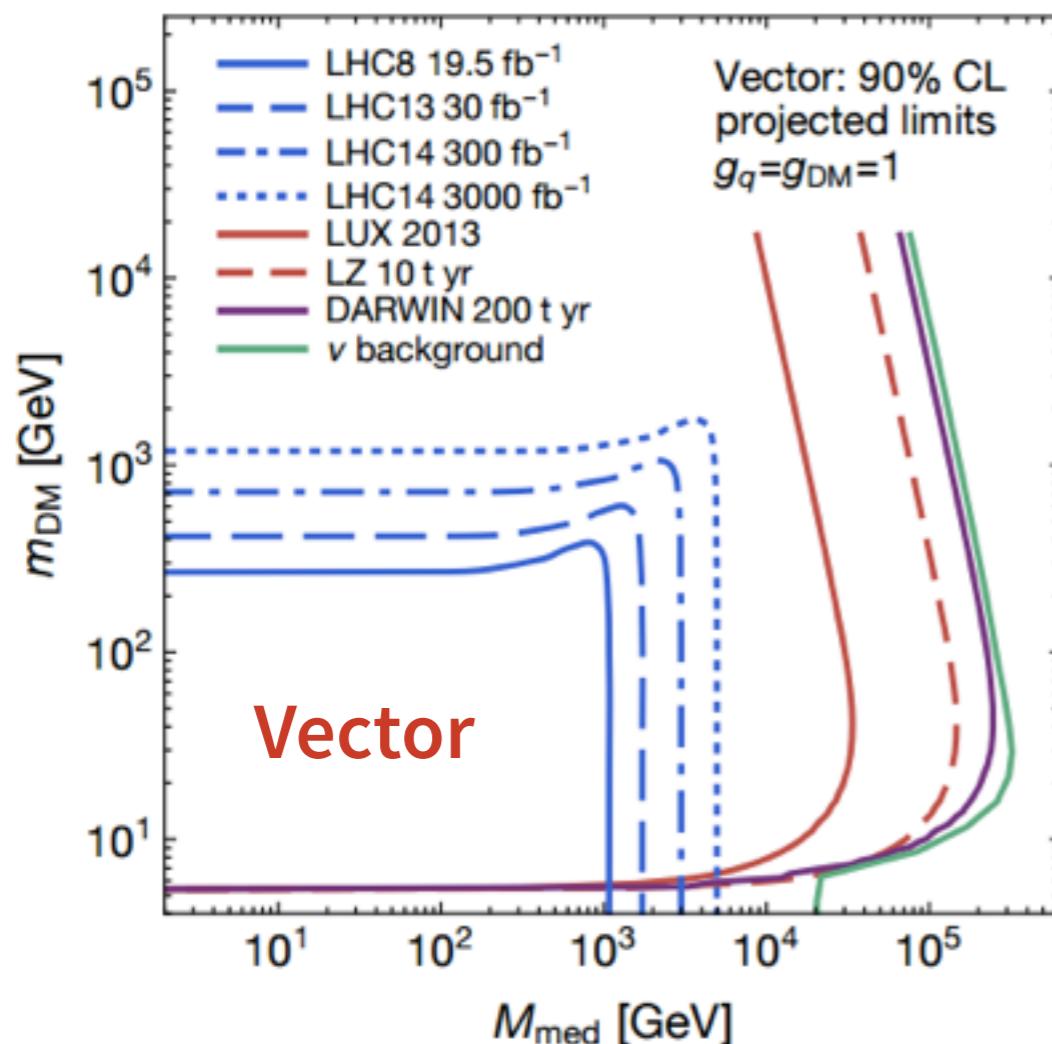

Complementary to DM + tt search

# Sensitivity projections

## Projections for

- ▶ Run-II:  $30 \text{ fb}^{-1}$  @ 13 TeV
- ▶ Run-III:  $300 \text{ fb}^{-1}$  @ 14 TeV
- ▶ HL-LHC:  $3000 \text{ fb}^{-1}$  @ 14 TeV

## Expected limits for

- ▶ LUX-ZEPLIN: 10 tonne years exposure
- ▶ DARWIN 200 tonne years exposure

# Conclusions

- ▶ **The Dark Matter problem stands out as one of the major challenges for modern physics**
  - LHC allow to probe DM at the frontiers of high energy physics in a variety of direct searches
- ▶ **Needs appropriate interpretation of the searches and careful comparison with other experiments**
  - Simplified models provide a more accurate interpretation framework with respect to EFT
  - Working closely with theorists to develop new models

**LHC Run-II is just started and we are waiting for more data  
Hopefully the discovery is just behind the corner!**

**Thank you  
for your attention!**

# **Additional Material**

# Monojet Systematic Uncertainties

## ► Experimental uncertainties on transfer factors R

- Lepton efficiency: 1/2% ( $\mu/e$ )
- Lepton veto: 3%
- Photon efficiency: 2%
- Photon purity: 2%

## ► Theoretical uncertainties on transfer factors R

- QCD scale, PDF uncertainties
- EWK corrections

## ► Systematic uncertainties on minor bkggs

- Top cross section: 10%
- Diboson cross-section: 20%
- Luminosity: 12%
- MET: 4%
- b-veto: 6%

- ▶ **tt di-leptonic**
  - irreducible background for tt+ DM semileptonic channel
- ▶ **Large  $E_T^{\text{miss}}$  from neutrino and missing lepton**
  - This implies higher  $M_T$
- ▶ **Transverse mass  $M_{T2}$  can be used to reject such kind of background events**
  - $M_{T2}^W$  is the minimal mother particle mass compatible with assumed event topology and daughter particle mass

$$M_{T2}^W = \min \left\{ m_y \text{ consistent with: } \begin{array}{l} \vec{p}_1^T + \vec{p}_2^T = \vec{E}_T^{\text{miss}}, \quad p_1^2 = 0, \quad (p_1 + p_\ell)^2 = p_2^2 = M_W^2, \\ (p_1 + p_\ell + p_{b_1})^2 = (p_2 + p_{b_2})^2 = m_y^2 \end{array} \right\}$$

# Bounds on $\sigma_{\chi-N}$

[CMS, JHEP 06 (2015) 121]

- ▶ Upper limits on  $\sigma_\chi$  translated in lower limits on  $M^*$  (interaction scale)

- Ex: scalar interaction  $\propto (M^*)^{-3}$

$$\mathcal{O} = \frac{m_q}{M_*^3} \bar{q} q \bar{X} X$$

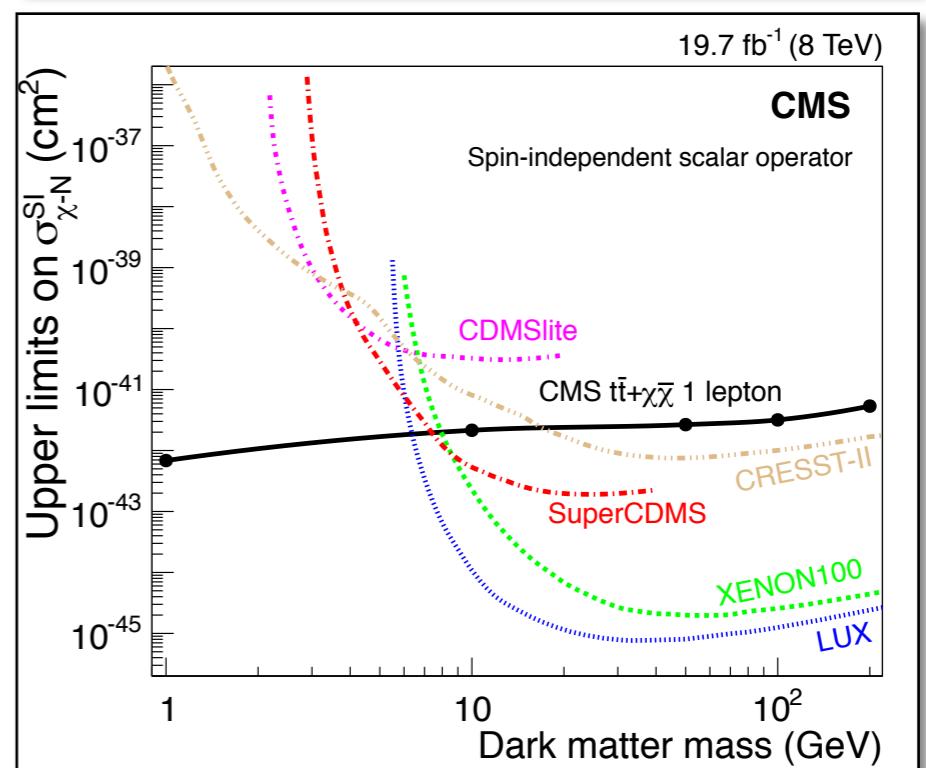

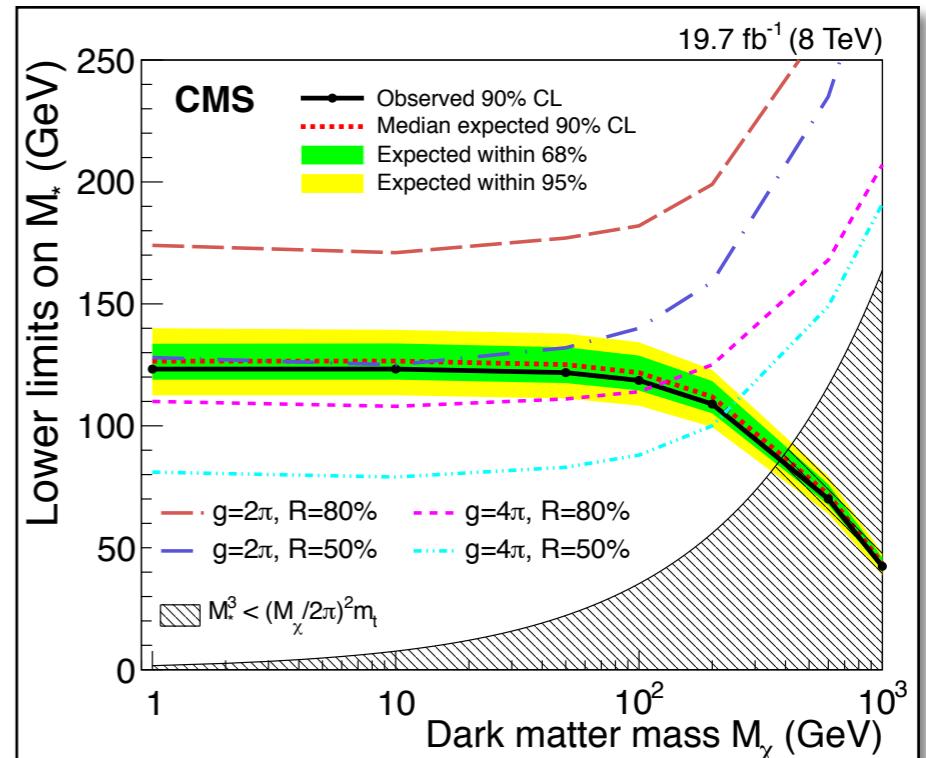

- And  $\sigma_\chi \propto (M^*)^{-6}$

$$M^* = M_{gen}^* \left( \frac{\sigma_{gen}}{\sigma_\chi} \right)^{(1/6)}$$

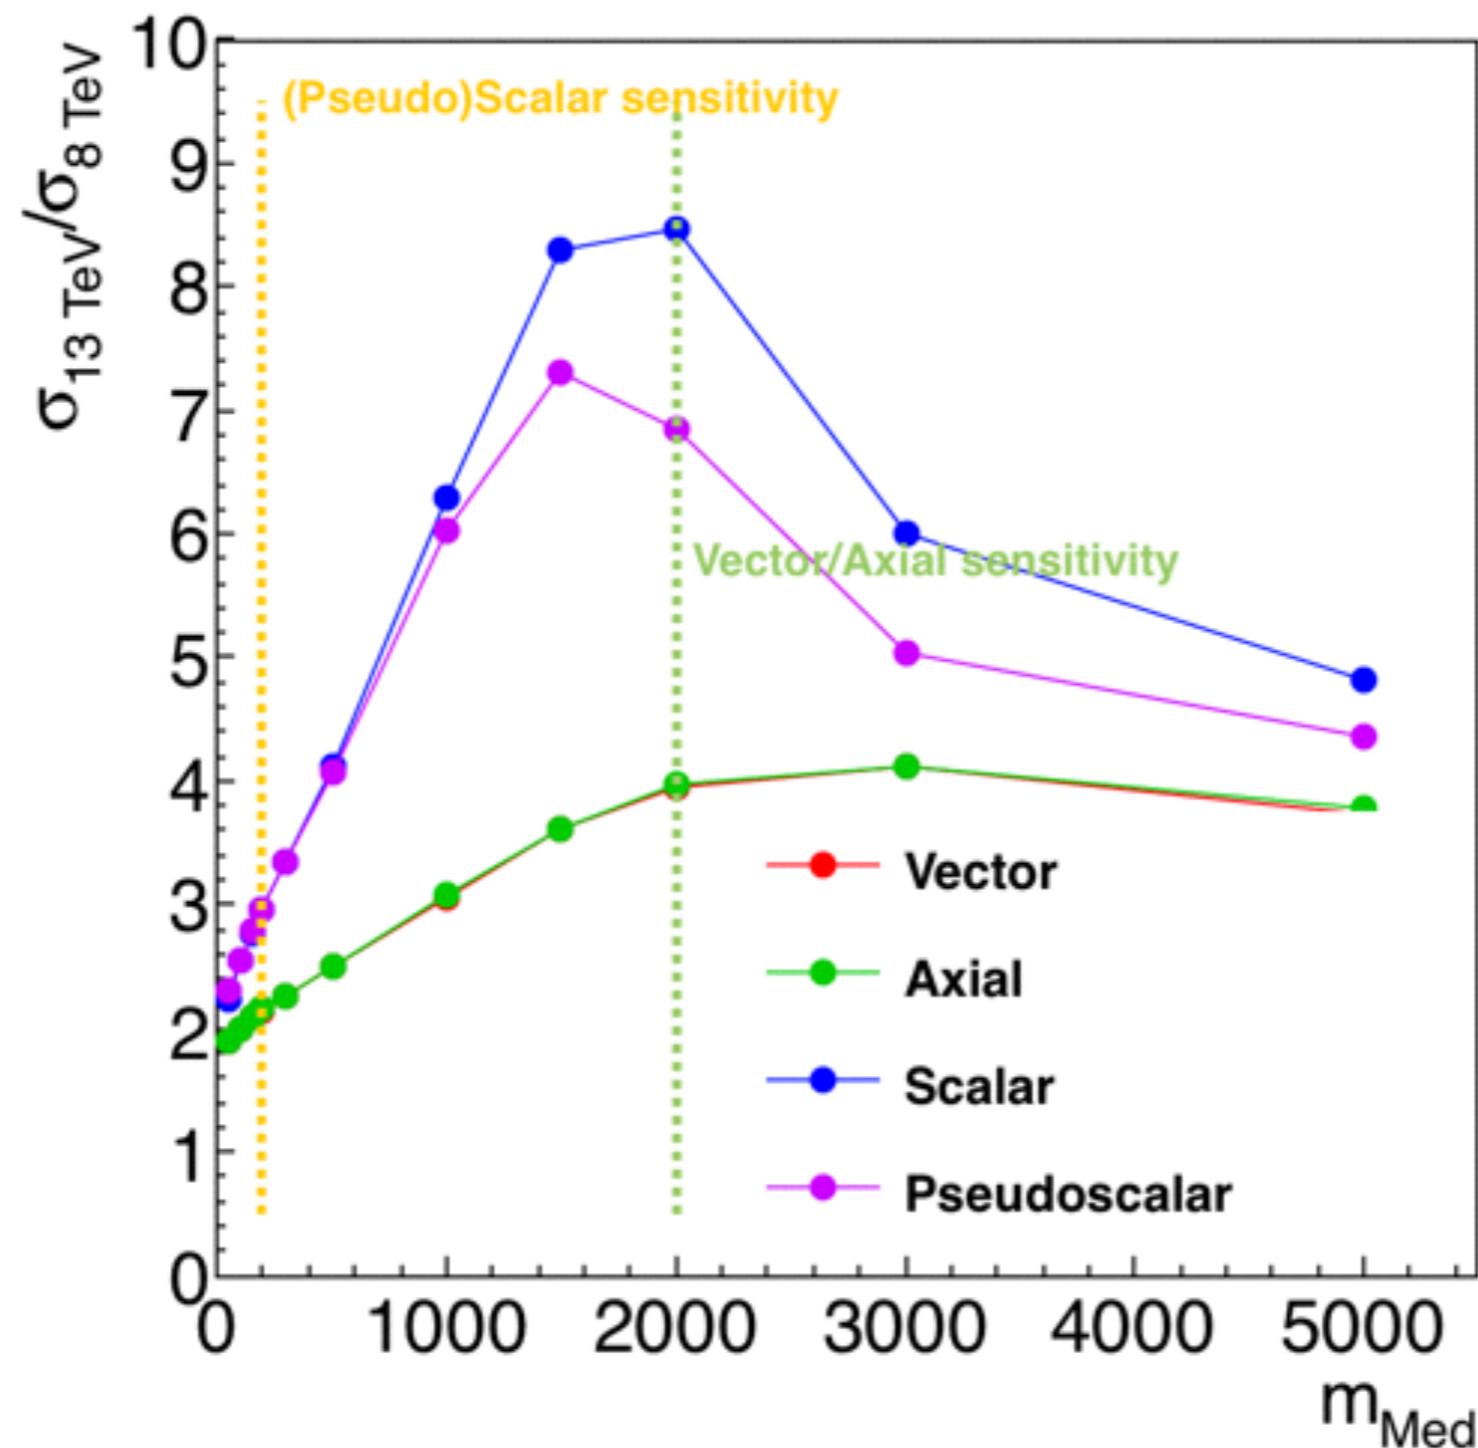

- Translation of the constraints on  $M^*$  in bounds on  $\sigma_{\chi-N}$  (SI or SD according to the case)

- Phys.Rev.D82:116010,2010

$$\sigma_0^{D1} = 1.60 \times 10^{-37} \text{ cm}^2 \left( \frac{\mu_\chi}{1 \text{ GeV}} \right)^2 \left( \frac{20 \text{ GeV}}{M^*} \right)^6$$

# $\sigma_{13\text{TeV}}/\sigma_{8\text{TeV}}$ (monojet)

# Monotop @ 8 TeV

CMS PAS B2G-15-001

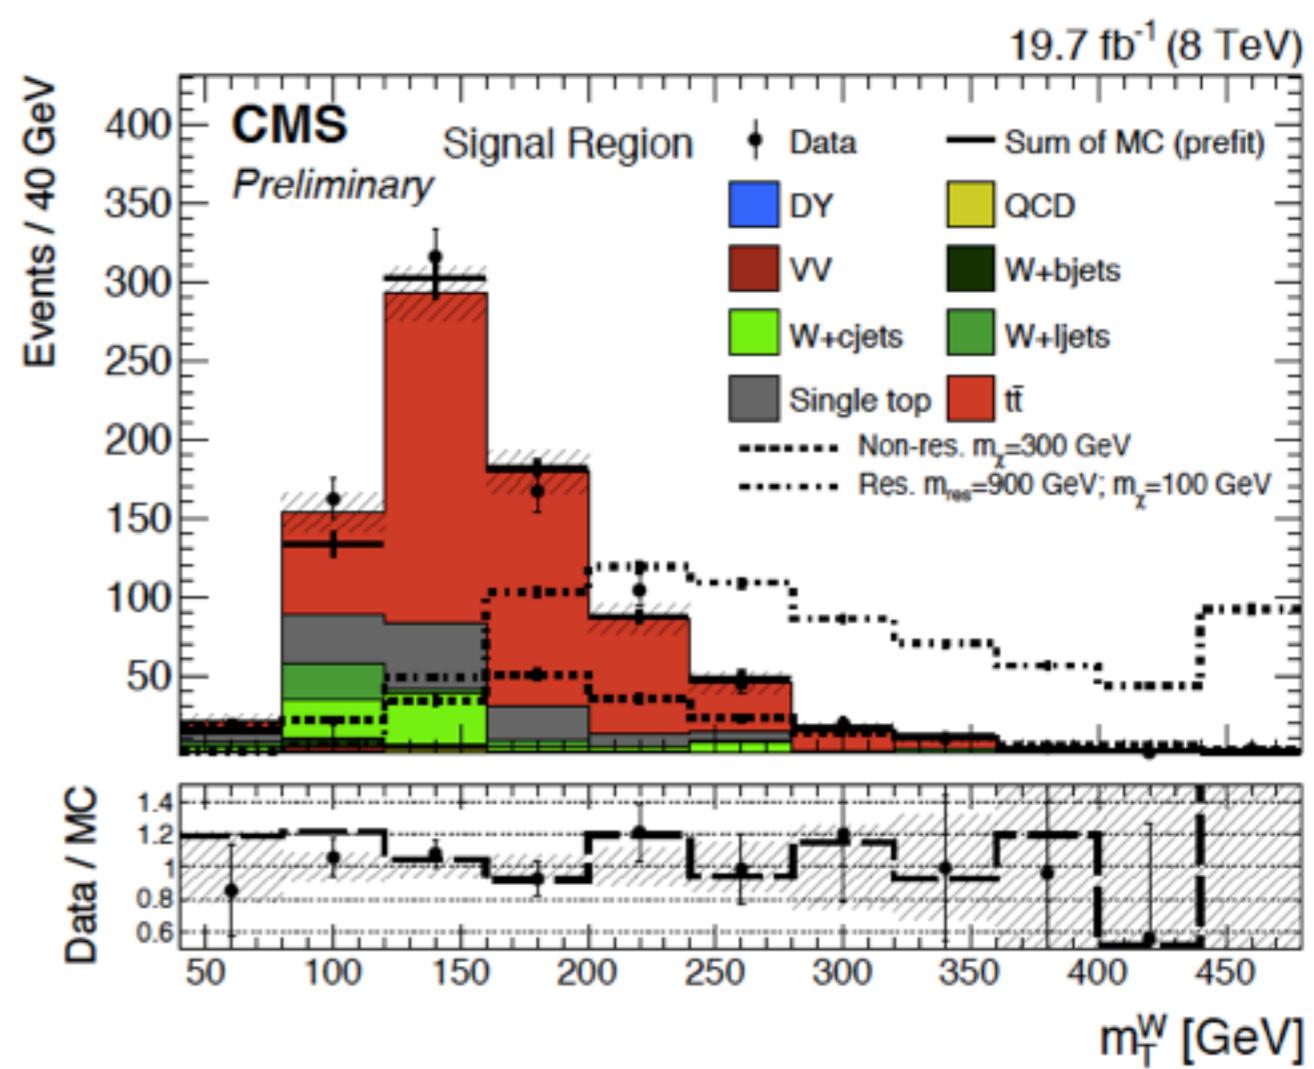

**SM production of single top associated to large  $E_T^{\text{miss}}$  (monotop signature) suppressed**

- ▶ Two production modes BSM:
  - **FCNC interaction** with an invisible Vector/Scalar DM particle
  - **Resonant production** of an invisible exotic state
- ▶ Signal signature:
  - 1 b-jet, 1  $\mu + E_T^{\text{miss}}$
  - Excess of events in  $m_T^W$  tails

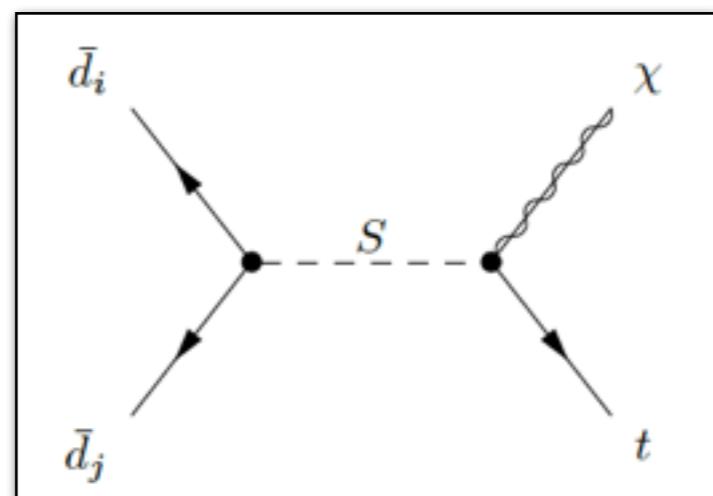

$$m_T^W = \sqrt{2 p_T^\mu E_T^{\text{miss}} (1 - \cos(\Delta\phi(\mu, E_T^{\text{miss}})))}$$

- Previous CMS search: hadronic decay

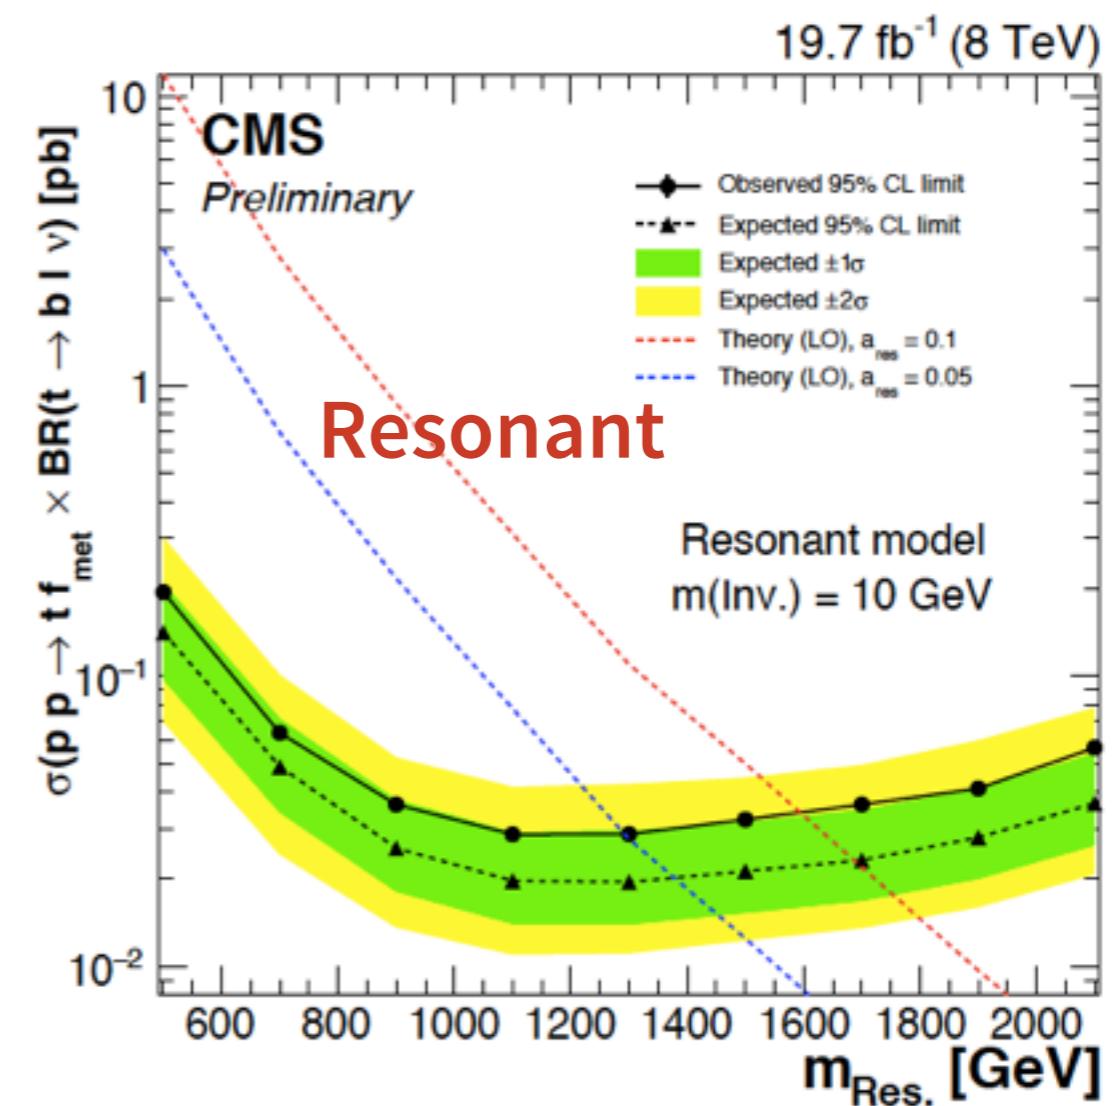

# Monotop @ 8 TeV: Results

- ▶ Main backgrounds, W+jets and ttbar, modelled from control samples
  - W enriched CR (1j 0b)
  - ttbar enriched CR (2j 2b)
- ▶ Template fit to  $m_T^W$  spectrum in signal and control samples

Resonant scenario excluded for resonant particle masses **up to 1610 GeV** ( $a_{\text{res}} = 0.1$ )

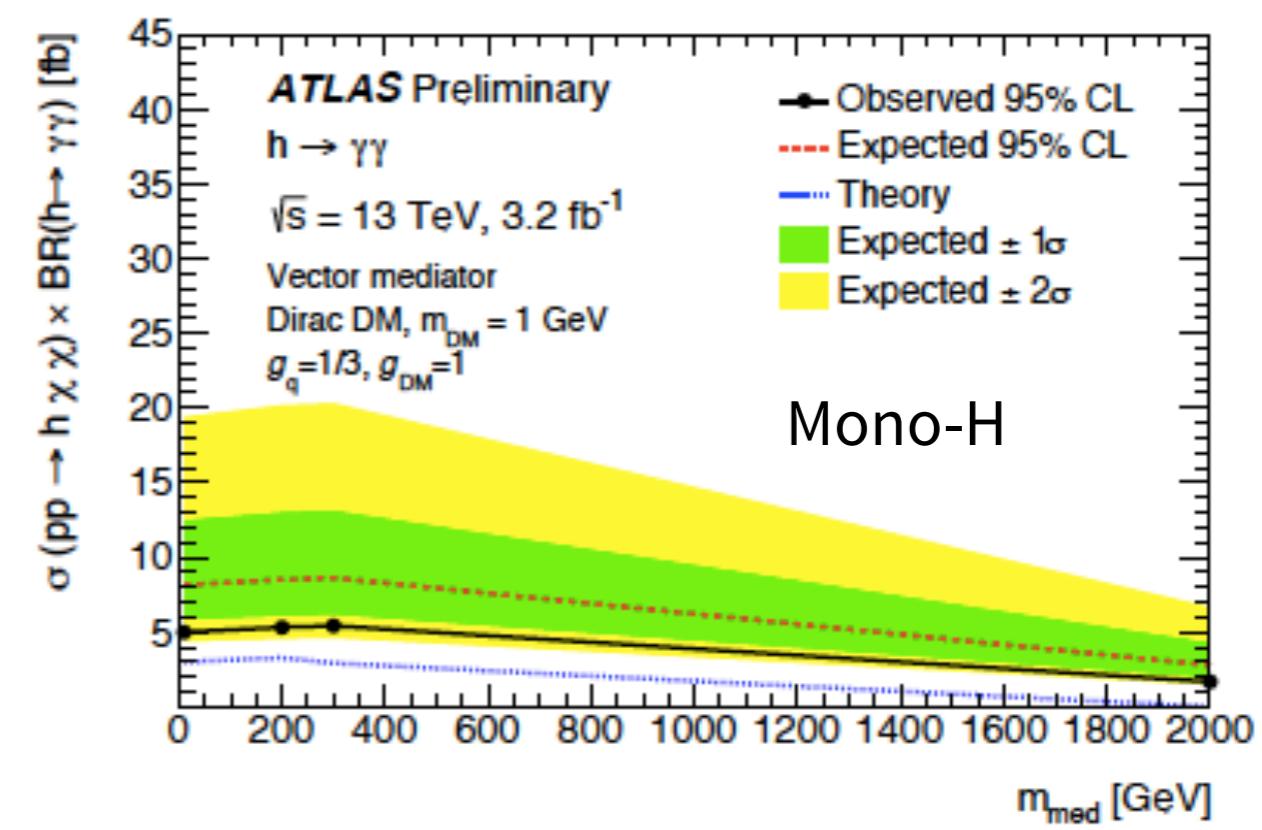

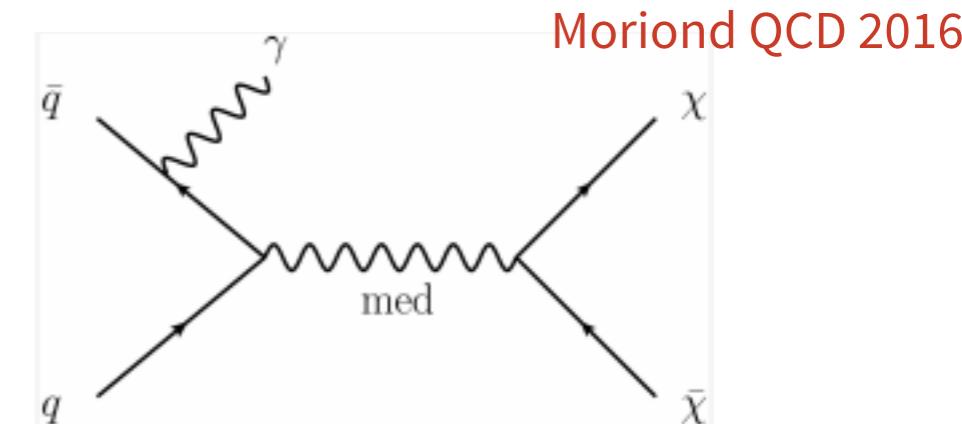

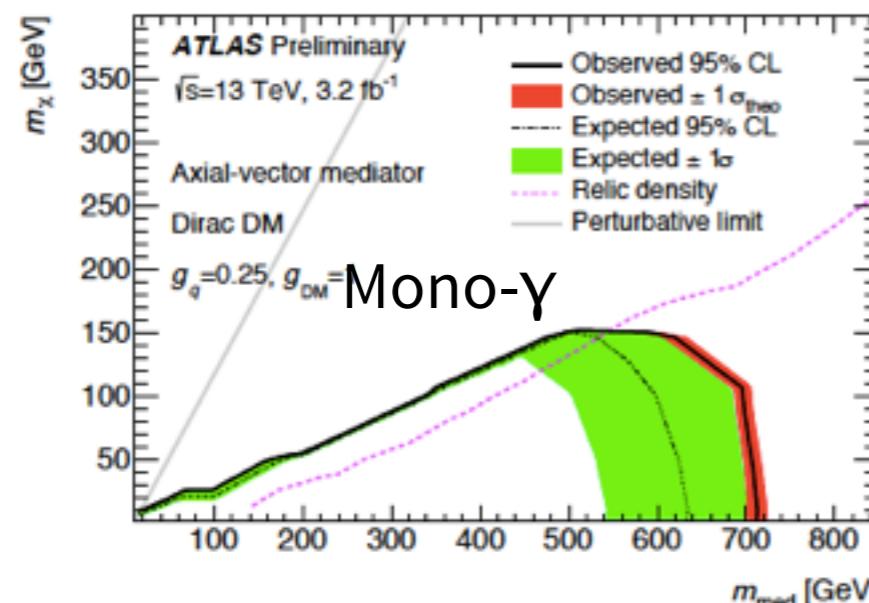

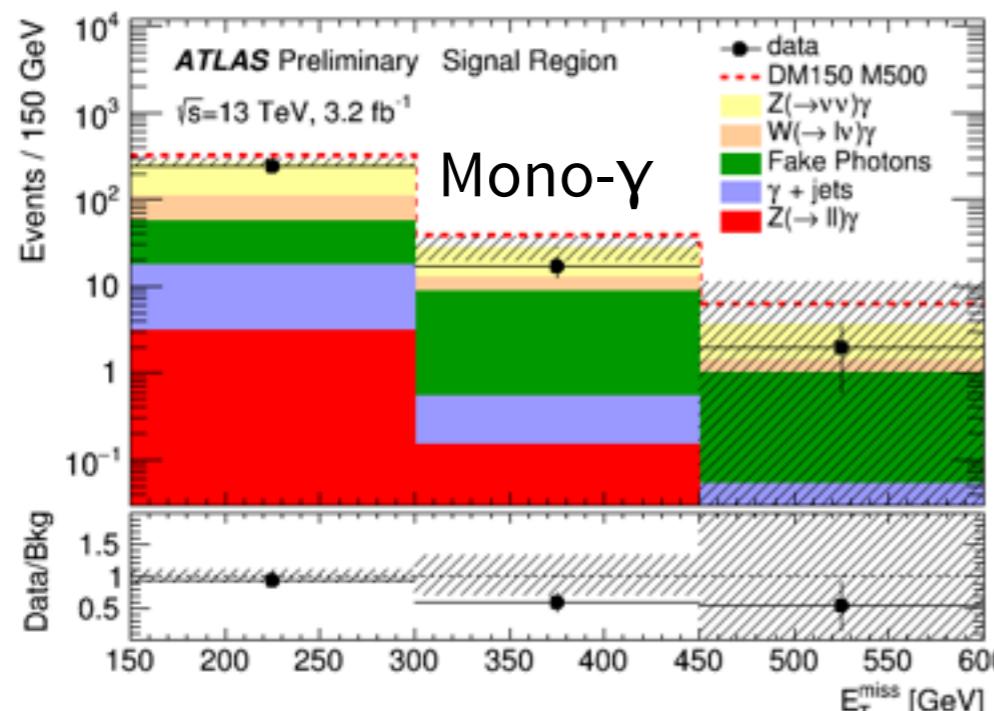

# More mono-searches

## ► Mono-Photon: $\gamma + \text{DM}$

- Major uncertainties from photon fake rate

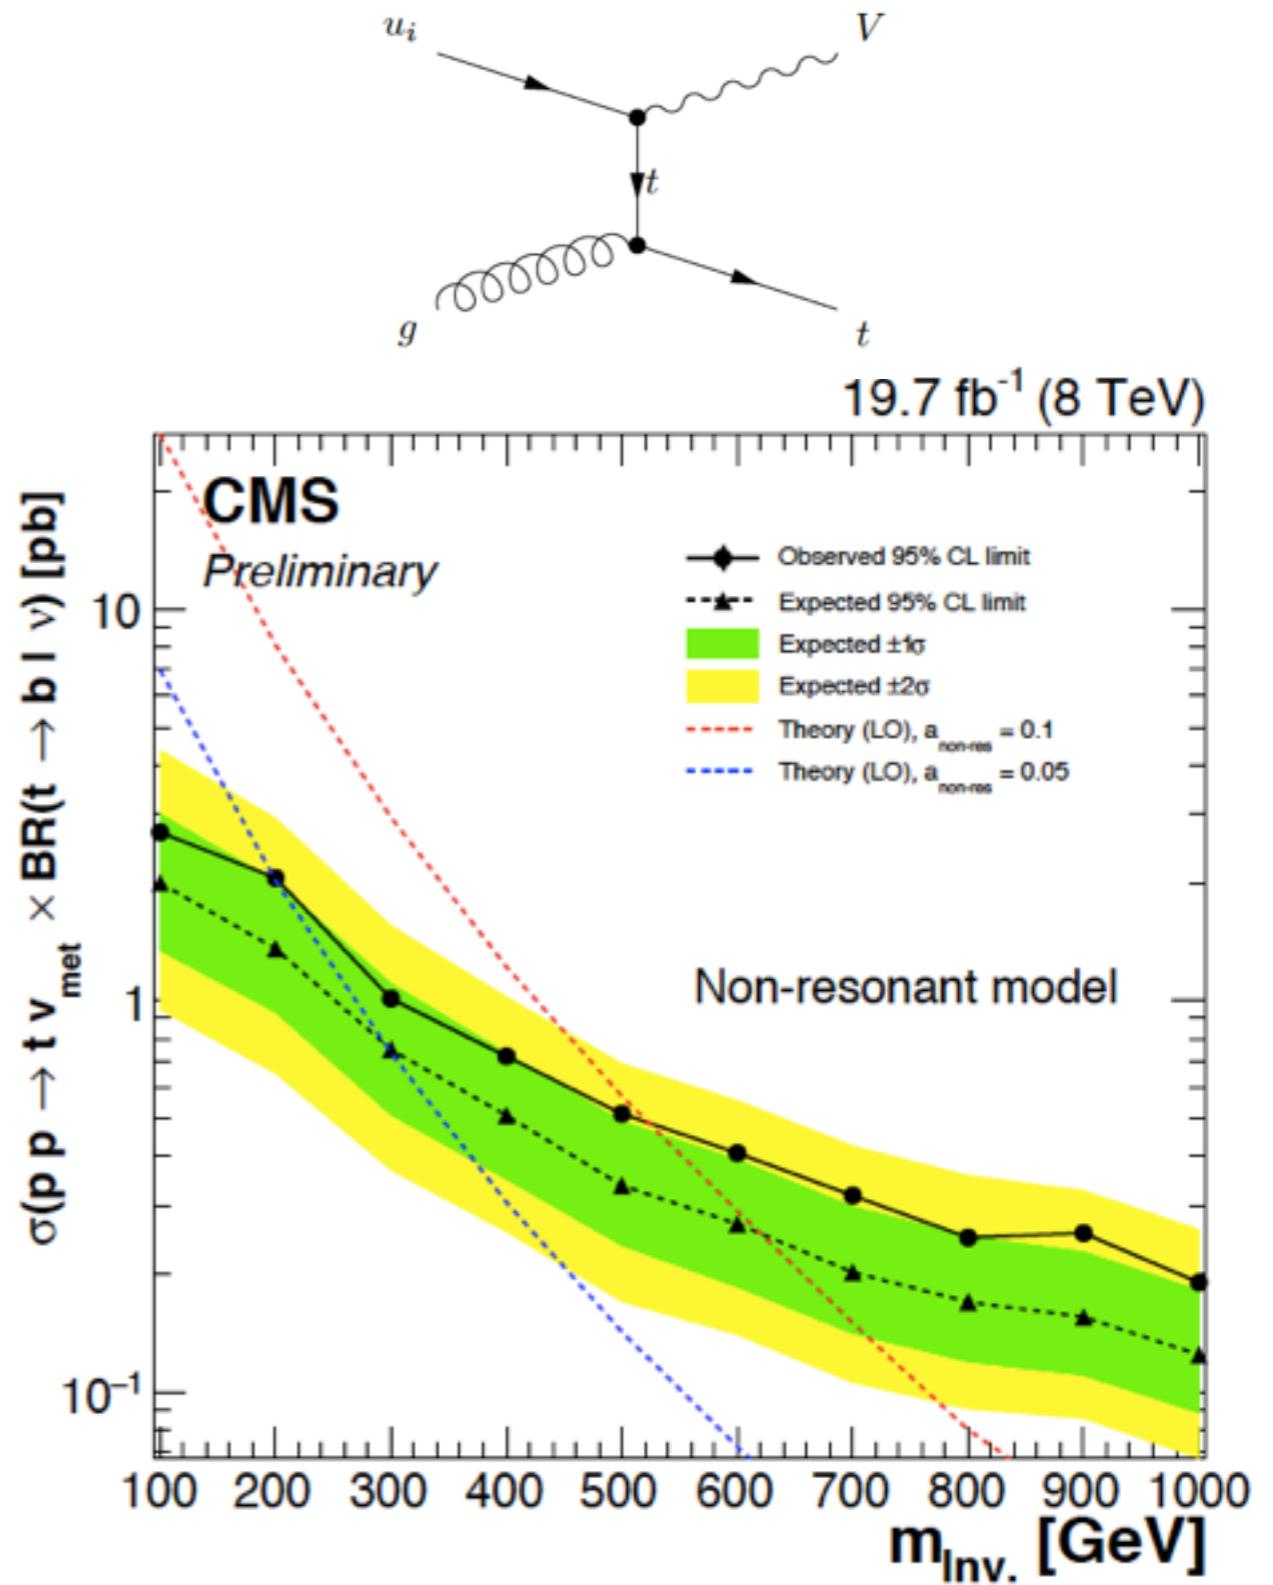

## ► Mono-Higgs: $H(\gamma\gamma/\text{bb}) + \text{DM}$

# Monotop @ 8 TeV

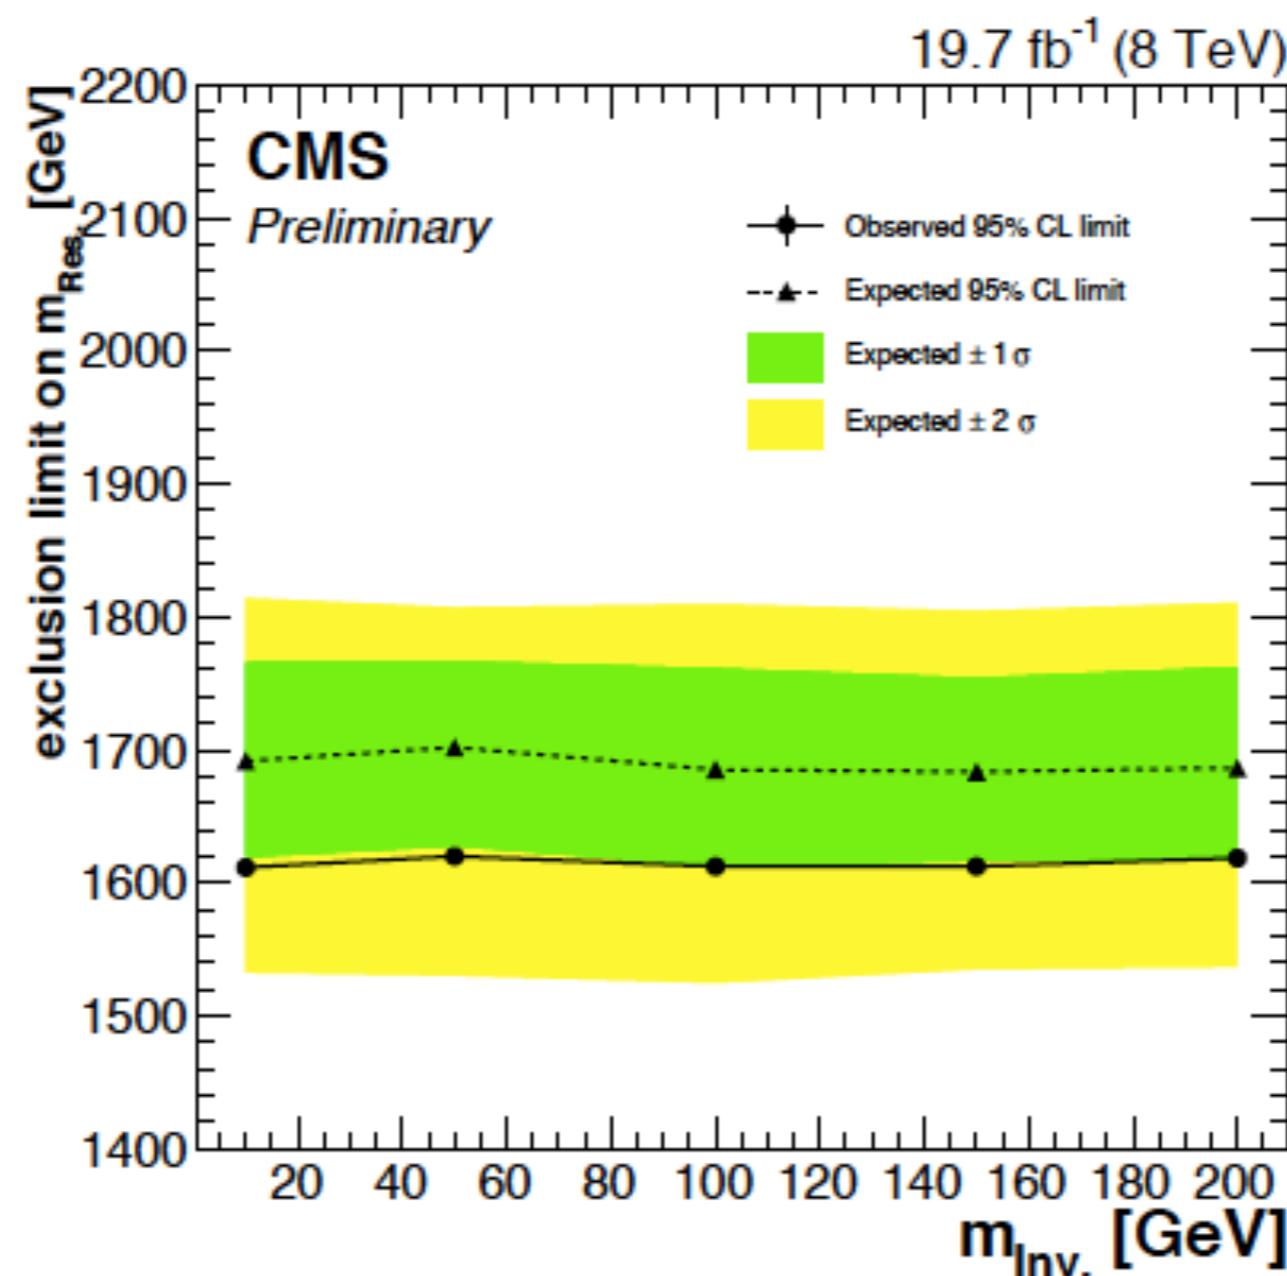

- ▶ Non-resonant scenario excluded for invisible particle masses **up to 523 GeV**
- ▶ Sensitivity close to hadronic channel
  - Invisible vector particles excluded up to **650 GeV** (CMS, arXiv:1410.1149v2])

CMS PAS B2G-15-001
