

Spectral methods in Causal Dynamical Triangulations

Thursday, 14 December 2017 18:20 (20 minutes)

Causal Dynamical Triangulations is one of the present promising numerical approaches to the problem of Quantum Gravity.

Motivated by the current lack of observables encoding geometric features at all scales, I will present a new set of observables based upon the analysis of eigenvalues and eigenvectors of the Laplace-Beltrami operator of triangulations, and discuss the main results obtained with this method.
