

# Probing Beta-Decay by Heavy Ion Charge Exchange Reactions

H. Lenske

Institut für Theoretische Physik, JLU Giessen

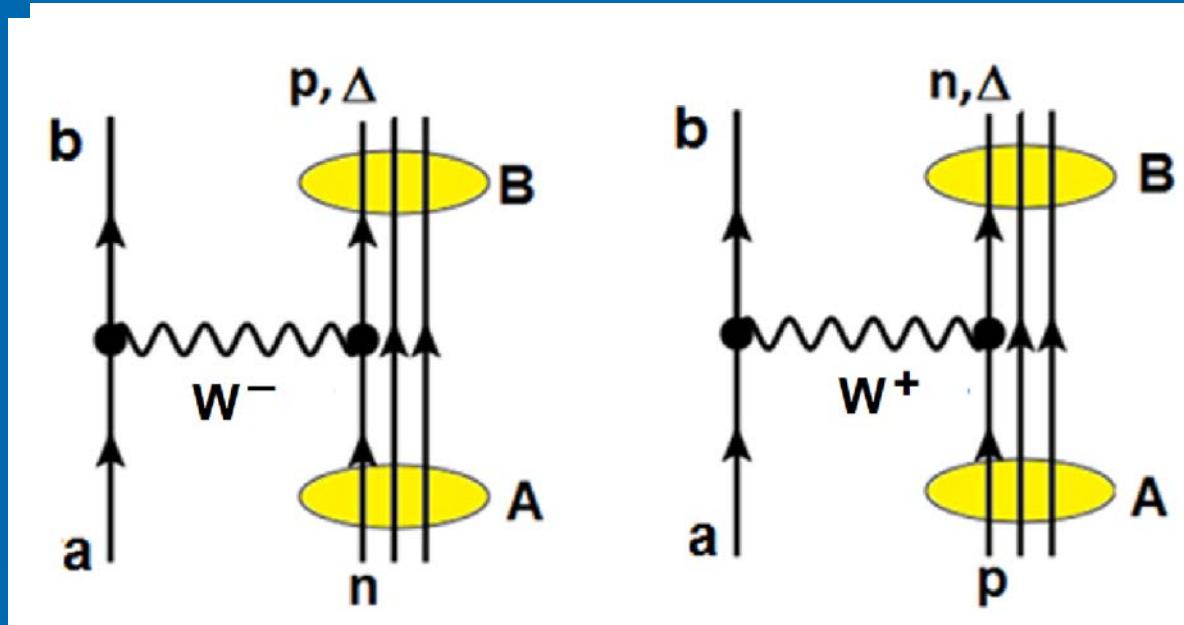

# Agenda:

- Investigating nuclear charge changing excitations:
  - single charge exchange (SCE) reactions
  - double charge exchange (DCE) reactions
- „Majorana“ DCE reactions:
  - „ $0\nu2\beta$ “ operator structure in hadronic interactions
  - DCE reactions and nuclear matrix elements
- Outlook

# Nuclear Reactions as Probes for Nuclear $\beta$ -Matrix Elements

# Charge Exchange Reactions $\leftrightarrow$ Charged Currents:

$\Delta q = \pm 1$  excitation of Fermi- ( $J^\pi = 0+, 1-, \dots$ ) and GT- ( $J^\pi = 0-, 1+, \dots$ ) type states

Operators acting on projectile and target:

$$\{1_\sigma, \vec{\sigma}, \vec{\sigma} \times \vec{q}\} \otimes \tau_\pm$$

# „Majorana“ DCE and $0\nu 2\beta$ Transitions

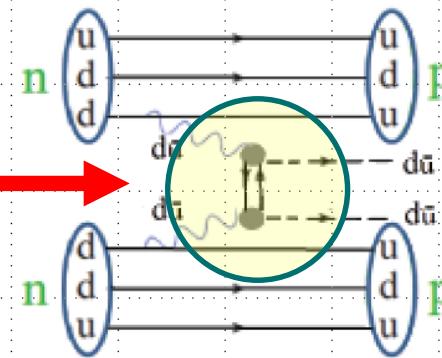

# Weak Interaction $0\nu2\beta$ decay and Strong Interaction Analogue

weak  $0\nu2\beta$  decay

- simultaneous  $d \rightarrow u$   $\Delta q=+1$  transitions by emission of a virtual weak gauge boson  $W^-$
- $W^- \rightarrow e^- + \bar{\nu}_e / \nu_e$ : decay into electron and Majorana neutrino
- Correlation of the two events by exchange of the virtual  $e^- \bar{\nu}_e$  pair
- Emission of two electrons ON their mass-shell:  
 $p^2_{e^-} = m^2_{e^-}$
- Direct observation (GERDA@LNGS...)

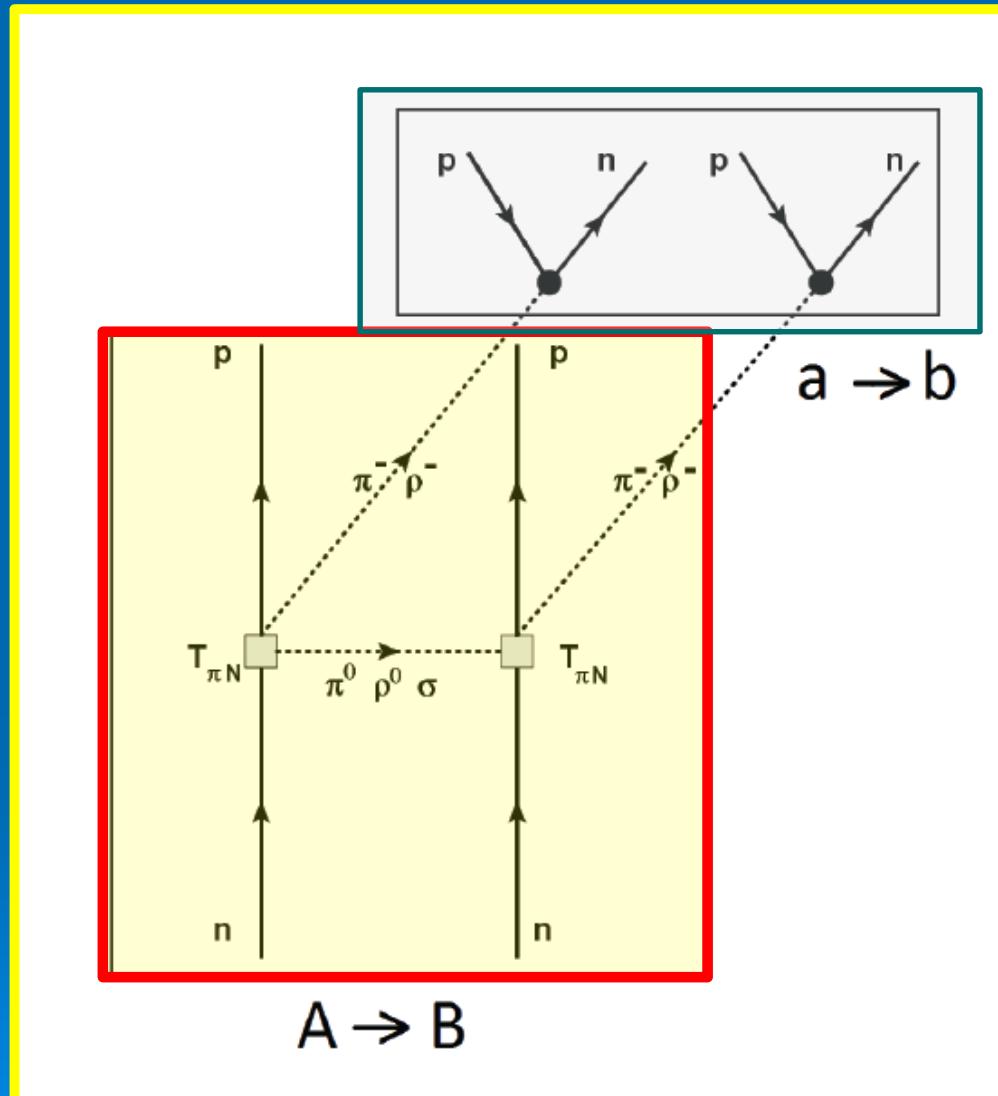

Hadronic analogue

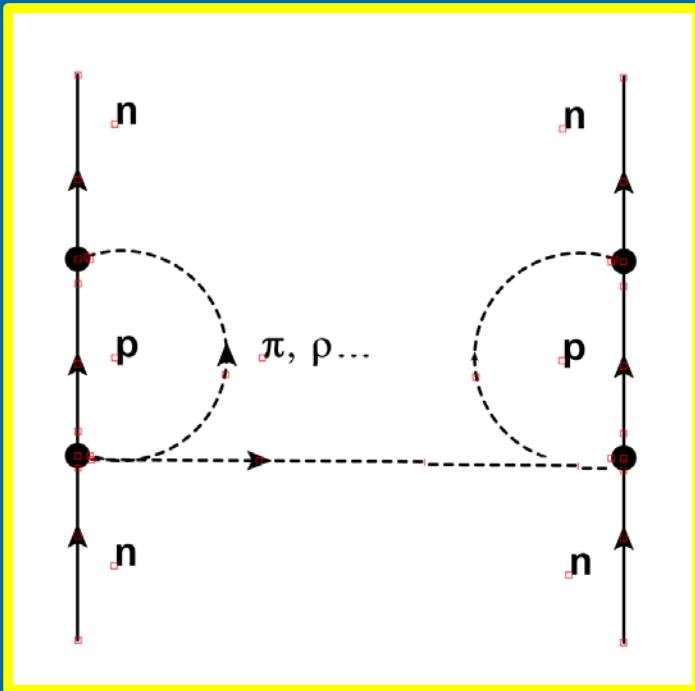

- simultaneous  $d \rightarrow u$   $\Delta q=+1$  transitions by emission of a virtual  $d\bar{u}$  vector pair  $\leftrightarrow \rho^-$  meson
- $\rho^- \rightarrow \pi^- + \pi^0$ : decay into a pair of pions
- Heavy vector mesons  $\rho^-$ \*
- Correlation of the two events by exchange of the virtual  $q\bar{q}$  pair as contained in  $\pi^0 \cong (dd+u\bar{u})/\sqrt{2}$
- Emission of two  $\pi^-$  OFF their mass-shell:  
 $p^2_{\pi^-} \neq m^2_{\pi^-}$
- No direct observation
