Effective Field theories (EFT)

Name	Operator	Coefficient
D1	$\bar{\chi}\chi \ \bar{q}q$	$m_q/\Lambda^3$
D2	$ar{\chi}\gamma^5\chi\ ar{q}q$	$im_q/\Lambda^3$
D3	$ar{\chi}\chiar{q}\gamma^5 q$	$im_q/\Lambda^3$
D4	$\bar{\chi}\gamma^5\chi\ \bar{q}\gamma^5q$	$m_q/\Lambda^3$
D5	$\bar{\chi}\gamma_{\mu}\chi\ \bar{q}\gamma^{\mu}q$	$1/\Lambda^2$
D6	$\bar{\chi}\gamma_{\mu}\gamma^{5}\chi \ \bar{q}\gamma^{\mu}q$	$1/\Lambda^2$
D7	$\bar{\chi}\gamma_{\mu}\chi \ \bar{q}\gamma^{\mu}\gamma^{5}q$	$1/\Lambda^2$
D8	$\bar{\chi}\gamma_{\mu}\gamma^{5}\chi \ \bar{q}\gamma^{\mu}\gamma^{5}q$	$1/\Lambda^2$
D9	$\bar{\chi}\sigma_{\mu\nu}\chi\ \bar{q}\sigma^{\mu\nu}q$	$1/\Lambda^2$
D10	$\bar{\chi}\sigma_{\mu\nu}\gamma^5\chi\;\bar{q}\sigma^{\mu\nu}q$	$i/\Lambda^2$
D11	$\bar{\chi}\chi G^{\mu\nu}G_{\mu\nu}$	$\alpha_s/4\Lambda^3$
D12	$\bar{\chi}\gamma^5\chi \ G^{\mu\nu}G_{\mu\nu}$	$i\alpha_s/4\Lambda^3$
D13	$\bar{\chi}\chi G^{\mu\nu}\tilde{G}_{\mu\nu}$	$i \alpha_s / 4 \Lambda^3$
D14	$\bar{\chi}\gamma^5\chi G^{\mu\nu}\tilde{G}_{\mu\nu}$	$\alpha_s/4\Lambda^3$

- Only 2 parameters:  $\Lambda, m_{\chi}$
- Signal scales with  $\Lambda$ :  $N_{events} = \mathcal{L}_{int} \frac{f(m_{\chi})}{\Lambda^{2(d-4)}}$
- Optimal choice for DD searches

EFT validity Problems. EFT Validity Condition

### Validity Condition

$$Q_{\rm tr}^2 < M^2 = g_\chi g_q \Lambda^2$$

To ensure EFT validity at LHC, we can throw away events with  $Q_{\rm tr}^2 > M^2$  produced by your event generator (Truncation) [1307.2253, 1402.1275, 1405.3101]

### DM models: from EFT to Simplified Models Simplified Models

Name	Operator	Model
D1	$\bar{\chi}\chi \ \bar{q}q$	S(SS)
D4	$ar{\chi}\gamma^5\chi\ ar{q}\gamma^5q$	P(PP)
D5	$\bar{\chi}\gamma_{\mu}\chi \ \bar{q}\gamma^{\mu}q$	V(VV)
D8	$\bar{\chi}\gamma_{\mu}\gamma^{5}\chi \;\bar{q}\gamma^{\mu}\gamma^{5}q$	A(AA)
D11	$\bar{\chi}\chi G^{\mu\nu}G_{\mu\nu}$	S(SS)

- Simplest UV-safe models that yield EFT dim-6 operators
- Replace contact interactions with propagating degrees of freedom
- Scalar (and pseudoscalar) also introduce dim-7 operator with gluons through top loop
- D2,D3,D6,D7 can also be reproduced, by changing the coupling structure
- All other EFT dim-6 and 7 operators arise at loop level in such models

- Simplified Models: consistency

#### 2) Gauge Invariance for spin 0 models

- Minimal case: 1 higgs doublet
- Next-to-Minimal case: 2 higgs doublets
- Collider signatures

#### Summary

Conclusions

Simplified Models: consistency (s-ch)

- A full UV consistent theory, features: only renormalizable interactions, gauge invariance ↔ renormalizable theory, anomaly-free
  - Only renormalizable interactions
  - Anomalies are neglected and the particles to fix them are supposed not to play an important role
  - X Simplified models listed before are not (all) gauge invariant
- Models are invariant only under  $SU(3)_c \times U(1)_{em}$ , but not under  $SU(2)_L \times U(1)_Y$ , neither under  $U(1)_{dark}$  in V, A models
  - Spin 1 models have a massive gauge boson whose mass term is not G.I.
  - Spin 0 models have  $\bar{q}q$  terms that are not G.I.

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Simplified Models: consistency spin 1

- Pure Vector can acquire mass with Stuckelberg mechanism, no higgs required
- Presence of any new axial coupling implies requirement for new higgs
- New higgs  $\phi$  will in general mix with SM higgs  $\Phi$  via  $\Phi^{\dagger}\Phi\phi^{\dagger}\phi$
- Axial couplings for SM particles require SM higgs charge under new U(1), resulting in Z – Z' mixing

Model	Gauge Invariant	Dark Higgs	h-h'	Z-Z'	Mediators
VV	Yes	No	No	No	1
VA	No	Yes	Yes	No	1-3
AV	No	Yes	Yes	Yes	2-4
AA	No	Yes	Yes	Yes	2-4

### 1510.02110

G. Busoni (University of Melbourne)

Simplified Models: consistency spin 0

- $\bullet\,$  Dark matter (singlet) can only couple to a singlet scalar  $S\,$
- SM fermions can only couple to scalars that have the same quantum numbers of an higgs doublet
- A new singlet scalar *S* can acquire a coupling only by mixing with the scalar inside the doublet
- Minimal choice: only one higgs doublet  $\rightarrow S h$  mixing
- Next to minimal choice:  $2HDM \rightarrow S H$  mixing

Model	G. Inv.	Dark Singlet	Doublets	S-h	S-H	Mediators
SS	No	Yes	1	Yes	-	2
SP	No	Yes	1	Yes	-	2
SS	No	Yes	2	No*	Yes	2*

PP	No	Yes	2	No*	Yes	2*

#### DM models: from EFT to Simplified Models

- Effective Field theories (EFT)
- Simplified Models
- Simplified Models: consistency

### 2) Gauge Invariance for spin 0 models

- Minimal case: 1 higgs doublet
- Next-to-Minimal case: 2 higgs doublets
- Collider signatures

#### Summary

Conclusions

### Gauge Invariance for scalar models

Minimal case: 1 higgs doublet

$$\mathcal{L}_{new} = \frac{1}{2} \partial^{\mu} S \partial_{\mu} S + \frac{1}{2} M_{SS}^2 S^2 - \frac{1}{2} \lambda_{HS} \phi^{\dagger} \phi S^2 - \frac{1}{4!} \lambda_S S^4 - y_{DM} S \bar{\chi} \chi$$
$$\begin{pmatrix} h \\ s \end{pmatrix} = \begin{pmatrix} \cos \epsilon & -\sin \epsilon \\ \sin \epsilon & \cos \epsilon \end{pmatrix} \begin{pmatrix} \phi^0 - \langle \phi^0 \rangle \\ S - \langle S \rangle \end{pmatrix}$$
$$\mathcal{L}_{int} = -y_i \bar{Q}_L^i u_R^i \tilde{\phi} = -m_i \bar{u}_L^i u_R^i (1 + \cos \epsilon \frac{h}{v} - \sin \epsilon \frac{s}{v})$$

Also the higgs now couples to DM:

$$-y_{DM}S\bar{\chi}\chi \rightarrow -y_{DM}\left(\sin\epsilon h + \cos\epsilon s\right)\bar{\chi}\chi$$

Both mediators therefore contribute to all cross sections:

$$\sigma_{\bar{q}q \to \bar{\chi}\chi + X} \propto (y_{\chi}y_q \sin \epsilon \cos \epsilon)^2 \Big(\frac{1}{Q^2 - M_h^2} - \frac{1}{Q^2 - M_s^2}\Big)^2$$

The mixing requires also the Higgs to couple to DM, and the product of the couplings for *h* and *s* is equal and opposite

G. Busoni (University of Melbourne)

Theoretical Models for Dark Matter

### Gauge Invariance for scalar models

Minimal case: 1 higgs doublet

#### Interference between the two mediators

G. Busoni (University of Melbourne)

Theoretical Models for Dark Matter

La Thuile 2017 16 / 39

Minimal case: 1 higgs doublet

- Higgs couples to DM
- Stringent DD constraints on  $\epsilon$ , even  $M_s \to \infty$  (but not for  $M_s \sim M_h$ )
- DD blind window at  $M_s \sim M_h$  [1509.05771]
- Bounds on h invisible give stringent constraints for  $m_\chi \lesssim M_h/2$
- Coupling to leptons arises as well
- Small couplings to fermions,  $\sim y_f \sin \epsilon \lesssim 0.4 y_f$

#### DM models: from EFT to Simplified Models

- Effective Field theories (EFT)
- Simplified Models
- Simplified Models: consistency

#### Gauge Invariance for spin 0 models

- Minimal case: 1 higgs doublet
- Next-to-Minimal case: 2 higgs doublets
- Collider signatures

#### Summarv

Conclusions

### Gauge Invariance for scalar models

Next-to-Minimal case: 2 higgs doublets

Alignment limit: 
$$M_{i,j} = \begin{pmatrix} M_{hh}^{\rho} & 0 & 0\\ 0 & M_{HH}^{\rho} & M_{HS}^{\rho}\\ 0 & M_{HS}^{\rho} & M_{SS}^{\rho} \end{pmatrix}$$
$$\mathcal{L}_{new} = -y_{DM}(\cos\theta S_2 + \sin\theta S_1)\bar{\chi}\chi - \frac{y_f\xi^f}{\sqrt{2}}(\cos\theta S_1 - \sin\theta S_2)\bar{f}f$$

	Type I	Type II
$\xi^u$	$\cot eta$	$\cot eta$
$\xi^d$	$\cot eta$	$-\tan\beta$
$\xi^\ell$	$\cot eta$	$-\tan\beta$

- Type II can allow an enhanced coupling to down quarks, for large values of  $\tan\beta$
- *u*, *d* quarks have same-sign couplings in Type I and opposite sign couplings in Type II

G. Busoni (University of Melbourne)

### Gauge Invariance for scalar models

Next-to-Minimal case: 2 higgs doublets

Not only interference between the two mediators, but also interference between different flavours (Type II)

G. Busoni (University of Melbourne)

Theoretical Models for Dark Matter

#### DM models: from EFT to Simplified Models

- Effective Field theories (EFT)
- Simplified Models
- Simplified Models: consistency

#### Gauge Invariance for spin 0 models

- Minimal case: 1 higgs doublet
- Next-to-Minimal case: 2 higgs doublets
- Collider signatures

### Summary

Conclusions

#### Gauge Invariance for scalar models Collider signatures

- Gen I models were all very similar and had similar signatures, i.e. mono-X from ISR (spin-1) and loop (spin-0)
- This difference was arising because of the structure of the couplings for spin 0/1

 G. inv. models with multiple mediators have additional differentiation. For scalar models, tighter connection with higgs sector and EW interactions mean additional sources of Mono-Z/W/h

#### DM models: from EFT to Simplified Models

- Effective Field theories (EFT)
- Simplified Models
- Simplified Models: consistency

#### 2 Gauge Invariance for spin 0 models

- Minimal case: 1 higgs doublet
- Next-to-Minimal case: 2 higgs doublets
- Collider signatures

# Summary Conclusions

- Construction of simple models valid at LHC and describing the relevant phenomenology
- EFT to simplified models is a first step in this direction
- First generation of SM not gauge invariant
- Gauge invariance implies multiple portals
- DD: presence of blind spots and negative interference effects
- LHC: more differentiation between spin 0 and spin 1
  - Enhanced mono-W/Z/h signals for spin-0

**Backup Slides** 

æ

Just one additional scalar coupled with generic couplings  $g_q y_i, y_\chi$ 

$$\mathcal{L}_{new} = \frac{1}{2} \partial^{\mu} S \partial_{\mu} S - \frac{1}{2} M^2 S^2 - \frac{g_q}{\sqrt{2}} S \sum_q y_i \bar{q}_i q_i - y_{DM} S \bar{\chi} \chi$$

The interaction term of S with quarks is not gauge invariant, as

$$\bar{q}_i q_i = \bar{q}_L^i q_R^i + \bar{q}_R^i q_L^i$$

is not SM singlet

4 A N

Assumptions

- S is a scalar, and is a portal to DM
- $\chi$  is a SM singlet
- S is exchanged in the s-channel
- Structure of SM yukawa lagrangian is not modified
- There is only one Higgs doublet

Implications

- S is a SM singlet
- *S* has to mix with SM higgs, as a quark scalar bilinear can only couple to a particle that has the same quantum numbers as an Higgs doublet

4 A N

- A 🖻 🕨

A Gauge invariant version of this model could be obtained by the following lagrangian ( $Z_2$  on S)

$$\mathcal{L}_{new} = \frac{1}{2} \partial^{\mu} S \partial_{\mu} S + \frac{1}{2} M_{SS}^2 S^2 - \frac{1}{2} \lambda_{HS} \phi^{\dagger} \phi S^2 - \frac{1}{4!} \lambda_S S^4 - y_{DM} S \bar{\chi} \chi$$

EW symmetry breaking mixes the SM higgs with the new scalar

$$\begin{pmatrix} h \\ s \end{pmatrix} = \begin{pmatrix} \cos \epsilon & -\sin \epsilon \\ \sin \epsilon & \cos \epsilon \end{pmatrix} \begin{pmatrix} \phi^0 - \langle \phi^0 \rangle \\ S - \langle S \rangle \end{pmatrix}$$

The mixing angle  $\epsilon$  has to be small, so that higgs and EW phenomenology does not get affected much (all SM signal strengths involving the higgs get a  $\cos^2 \epsilon$  factor)

Consequently,  $\cos \epsilon \sim 1$ ,  $\sin \epsilon < 0.4$ 

The h - s mixing gives s a coupling to Standard Model fermions:

$$\mathcal{L}_{int} = -y_i \bar{Q}_L^i u_R^i \widetilde{\phi} = -m_i \bar{u}_L^i u_R^i (1 + \cos \epsilon \frac{h}{v} - \sin \epsilon \frac{s}{v})$$

The coupling of s to quarks is indeed proportional to yukawas

$$g_q \equiv -\sin\epsilon$$

Also the higgs now couples to DM:

$$-y_{DM}S\bar{\chi}\chi \rightarrow -y_{DM}\left(\sin\epsilon h + \cos\epsilon s\right)\bar{\chi}\chi$$

Both mediators therefore contribute to all cross sections:

$$\sigma_{\bar{q}q \to \bar{\chi}\chi + X} \propto (y_{\chi}y_q \sin \epsilon \cos \epsilon)^2 \left(\frac{1}{s - M_h^2} - \frac{1}{s - M_s^2}\right)^2$$

The mixing requires also the Higgs to couple to DM, and the product of the couplings for h and s is equal and opposite

G. Busoni (University of Melbourne)

- $g_q = \sin \epsilon \le 1$  means low to moderate sensitivity
- Higgs couples to DM
- Stringent DD constraints on  $\epsilon$ , even  $M_s \to \infty$  (but not for  $M_s \sim M_h$ )
- DD blind window at  $M_s \sim M_h$  [1509.05771]
- Too weak signal at LHC unless at least one of the 2 mediators can go on shell
- Bounds on h invisible give stringent constraints for  $m_\chi \lesssim M_h/2$
- Coupling to leptons arises as well!
- VBF operator arises

$$L_{int,VBF} = -\sin\epsilon \left(2\frac{M_W^2}{v}W_{\mu}^+W^{-\mu} + \frac{M_z^2}{v}Z_{\mu}Z^{\mu}\right)s$$

- Conclusions of the previous slides are quite general
  - A more complex scalar sector would still lead to similar conclusions
- To get more freedom with couplings to quarks, the only way is to add an additional Higgs doublet
- New Lagrangian will contain the singlet *S* as well, for a total of 3 scalars

$$\begin{split} V(\Phi_1, \Phi_2, S) &= M_{11}^2 \Phi_1^{\dagger} \Phi_1 + M_{22}^2 \Phi_2^{\dagger} \Phi_2 + (M_{12}^2 \Phi_2^{\dagger} \Phi_1 + h.c.) \\ &+ \frac{\lambda_1}{2} (\Phi_1^{\dagger} \Phi_1)^2 + \frac{\lambda_2}{2} (\Phi_2^{\dagger} \Phi_2)^2 + \lambda_3 (\Phi_1^{\dagger} \Phi_1) (\Phi_2^{\dagger} \Phi_2) \\ &+ \lambda_4 (\Phi_2^{\dagger} \Phi_1) (\Phi_1^{\dagger} \Phi_2) + \frac{1}{2} \left( \lambda_5 (\Phi_2^{\dagger} \Phi_1)^2 + h.c. \right), \\ &+ \frac{1}{2} M_{SS}^2 S^2 + \frac{1}{3} \mu_S S^3 + \frac{1}{4} \lambda_S S^4 \\ &+ \frac{\lambda_{11S}}{2} (\Phi_1^{\dagger} \Phi_1) S^2 + \frac{\lambda_{22S}}{2} (\Phi_2^{\dagger} \Phi_2) S^2 + \frac{1}{2} (\lambda_{12S} \Phi_2^{\dagger} \Phi_1 S^2 + h.c.) \end{split}$$

#### • The 3 scalars will in general mix with arbitrary mixing angles

- There is always a region of the parameter space where one can decouple the first doublet and make it SM-like  $\cos(\beta \alpha) = 0$
- This region may rise up naturally in presence of some symmetries of the full UV model
- In that case  ${\cal S}$  mixes only with the scalar of the second doublet, and there is no constraints on the mixing angle
- SM phenomenology doesn't get affected in this limit, and no VBF operator arises

< 回 > < 三 > < 三 >

- In 2HDM, natural alignment arises in presence of the symmetry  $\lambda_1=\lambda_2=\frac{1}{2}\left(\lambda_3+\lambda_4+\lambda_5\right)$
- Under such symmetry, rotating the doublets of an angle  $\beta$  leave the couplings  $\lambda_{1,\dots,5}$  invariant
- Rotating in the higgs basis, where  $\langle \Phi_1 \rangle = \begin{pmatrix} 0 \\ v \\ \sqrt{2} \end{pmatrix}$  and

$$\langle \Phi_2 
angle = \left( egin{array}{c} 0 \\ 0 \end{array} 
ight)$$
 one gets the mass matrix

$$M^{\rho} = \begin{pmatrix} M^{\rho}_{hh} & 0 & M^{\rho}_{hS} \\ 0 & M^{\rho}_{HH} & M^{\rho}_{HS} \\ M^{\rho}_{hS} & M^{\rho}_{HS} & M^{\rho}_{SS} \end{pmatrix}$$
(1)

• To avoid the SM higgs to mix with the singlet state, one needs to require that in the new basis  $\lambda_{11S} = 0$ 

### Backup Slides Type I and II

In the alignment limit  $(\beta - \alpha = \pi/2)$ , ones gets (neglecting scalar interactions))

$$L = L_{SM} + \frac{1}{2} \partial^{\mu} S_i \partial_{\mu} S_i - \frac{1}{2} M_i^2 S_i^2 (i = 1, 2) + \bar{\chi} (i \partial - m_{\chi}) \chi$$
$$- y_{DM} (\cos \theta S_2 + \sin \theta S_1) \bar{\chi} \chi - \frac{y_f \xi^f}{\sqrt{2}} (\cos \theta S_1 - \sin \theta S_2) \bar{f} f$$

	Type I	Type II
$\xi^u$	$\coteta$	$\cot eta$
$\xi^d$	$\cot eta$	$-\tan\beta$
$\xi^{\ell}$	$\cot eta$	$-\tan\beta$

- Type II can allow an enhanced coupling to down quarks, for large values of  $\tan\beta$
- u, d quarks have same-sign couplings in Type I and opposite sign couplings in Type II

#### **Direct Detection Constraints**

Not only interference between the 2 mediators, but also interference between different flavours (Type II)

G. Busoni (University of Melbourne)

Theoretical Models for Dark Matter

La Thuile 2017 36 / 39

- The most general case is Type III
  - In this case, FCNC generally appear at tree level
- To get rid of them at tree level, one needs flavour-diagonal couplings (in mass eigenstates basis)
- In absence of symmetry, loop level FCNC will appear
- Examples of Yukawa patterns that are "protected" against loop level FNCN:
  - Aligned yukawas:  $y_H^U = \tan \gamma_u y_h^U, y_H^D = \tan \gamma_d y_h^D, y_H^l = \tan \gamma_l y_h^l$
  - Coupling only to first 2 generations:  $y_{H}^{u,c} = A, y_{H}^{d,s} = B, y_{H}^{b,t,l} = 0$

#### **Direct Detection Constraints**

Interference between flavours only happens for a certain ratio between the yukawa couplings
