## Hadron spectroscopy at LHCb

*Friday, 21 April 2017 12:45 (15 minutes)*

The latest years have seen a resurrection of interest in hadron spectroscopy where the LHC experiments, using data collected at pp collisions at 7, 8 and 13 TeV, are playing a relevant role. The two pentaquarks observed in 2015 and the recent five narrow  $\Omega_c$  states are challenging our knowledge about QCD. A status report on the studies and searches for standard and exotic hadrons is presented.
