Development of gaseous particle detectors based on semi-conductive plate electrodes

Friday, April 21, 2017 5:00 PM (1 hour)

A new kind of particle detector based on Resistive Plate Chamber structure is under development. Semi-Conductive electrodes with resistivity up to $10^8 \Omega \cdot \text{cm}$ are introduced to improve Rate Capability performance. The aim is to obtain a radiation hard detector with sub-nanosecond time resolution capable of working in high rate environment (order of MHz/cm²). In this presentation some results on two configurations under test are described. The first characterized by 1mm gas gap and both SI(Semi-Insulating)-Gallium Arsenide electrodes ($\sim 10^8 \Omega \cdot \text{cm}$), and the other characterized by 1.5mm gas gap, one SI-GaAs electrode and one intrinsic Silicon ($\sim 10^4 \Omega \cdot \text{cm}$) electrode.
