# Gravitational waves and gamma rays Synergies at MeV energies

M. Razzano University of Pisa & INFN-Pisa

On behalf of the LIGO Scientific Collaboration and the Virgo Collaboration

> e-ASTROGAM workshop 28 Feb – 3 March 2017

# **The multi-messenger frontier**

Optical (APOD)

Gamma rays > 0.1 GeV (Fermi-LAT)

# The multi-messenger sky today

Optical (APOD)

Gamma rays > 0.1 GeV (Fermi-LAT, 2013)

Cosmic rays > 57 Eev (Auger, 2007)

Neutrinos > 30 Tev (Icecube, 2013)

## The era of Advanced GW detectors

#### LIGO-Livingston (4 km)

#### Advanced LIGO now in its second observing run (O2) Virgo planned to join soon

## The era of Advanced GW detectors

#### Prospects for Observing and Localizing Gravitational-Wave Transients with Advanced LIGO and Advanced Virgo

Abbott, B. P. et al.

# The new frontiers of multimessenger astronomy

- Complementary information:
  - GW→ mass distribution
  - EM → emission processes, acceleration mechanisms, environment
  - Neutrinos → hadronic/nuclear processes, etc
- Give a precise (arcmin/arcsecond) localization
  - Localize host galaxy of a merger
  - Identify an EM counterpart with timing signature (e.g. pulsars)
  - EM follow-up to get simultaneous observations
- Provide a more complete insight into the most extreme events in the Universe
- Explore the physics of the progenitors (mass, spin, distance..) and their environment (temperature, density, redshift..)

#### Expected multimessengers sources by Advanced LIGO/Virgo

- Known waveforms (template banks)
- $\bullet E_{gw} \sim 10^{-2} Mc^2$
- Core-collapse of massive stars
  - Uncertain waveforms
  - $\bullet E_{aw} \sim 10^{-8} 10^{-4} Mc^2$

Ott, C. 2009

# Non transients

**Transients** 

#### Rotating neutron stars

- Quadrupole emission from star's asymmetry
- Continuous and Periodic

#### • Stochastic background

- Superposition of many signals (mergers, cosmological, etc)
- Low frequency

# Science case for EM follow-up: the GRB connection

#### Short GRBs (<2 s)

# The first synergy: GRBs

# **Other transients – Supernovae**

#### **Stellar explosions**

- What is the physical mechanisms behind Supernovae?
- What is the structure/asymmetry during collapse?
- Many inputs beyond GW are required
- •X and MeV energies observations are very important

# **Continuous sources– Neutron Stars**

#### **Continuous Waves**

- Non-linear instabilities and NS evolution
- Explore the nature of the NS crust
- Glitches
- Gamma-ray monitoring very useful to search

for GWs from known pulsars

Credits: NASA

Credits: ESO/L. Calcada

# **Continuous sources– Neutron Stars**

- High-B pulsars at MeV energies
- PSR B1509-59 is one of the candidates

# Back to the EM follow-up...

- Past experiences (2009-2010)
  - ~30 min latency, optical telescopes+Swift
  - Centralized organization
- Now (2015-)
  - Few mins latency
  - GCN alerts for EM partners (MoU)
  - Broadband coverage

EM event	EM band	Timescale
Prompt emission	Gamma rays	<seconds< td=""></seconds<>
Afterglow	X-ray, optical, radio	Hours-days
Kilonova-macronova	Optical-near IR	Davs-weeks
Radio blast wave	Radio	Months-years

## A needle in a haystack: an example from the past

#### Find a counterpart is not easy! •EM Transients might be

- Fast
- Faint
- Too many

# •Finding counterparts of GRBs was quite difficult

#### •For GWs, the situation is worse...

Credits: NASA

BAT Burst ImageXRT ImageUVOT Image</td

## **EM** follow-up : key challenges

#### •What is the best observing strategy?

- Scan the full error box?
- Look only to specific regions (e.g. potential galaxy hosts?)
- How to identify the potential host?
- If there is more than one candidate...
  - How can we uniquely identify it?
  - How can models help us?

## **Sky Localization of GW transients**

- "Triangulation" using temporal delays
- Depends on the SNR
- Low SNR  $\rightarrow$  large error box (tens hundreds sq deg)
- Wide-fov telescopes are required!

Abbott+16, LRR 19,1

Abbott+16, LRR 19,1

BNS system, SNR ~13.2 LALINFERENCE (left), BAYESTAR (right)

#### **Sky Localization**

Abbott+16, LRR 19,1

## EM follow-up: the role of gamma-ray telescopes

#### •GRBs are very energetic phenomena

- Best candidates for GWs from NS/NS system
- Clearly, strong HE emitters too

#### Gamma-ray telescopes are very useful

- Large FoV & good localization
- Kev-MeV-GeV energy coverage
- Gamma sky not so crowded as optical one
- However, detection required jet alignment (cuts event rate) (e.g. Patricelli,MR+16)

# Why an EM follow-up program?

#### •EM follow-up is key to find counterparts (and do great science)

- GW analysis and checks require time
- Need to avoid misinformation/rumors
- Encourage multiwavelength coverage

#### •LV-EM follow-up program

- Standard MoU to share information promptly while maintaning confidentiality for event candidates
- GW alerts sent to partners through private GCN notices/circulars
- Once first few (>=4) detections, prompt alerts will be made public for high-significance detections (FAR<1/100 yrs)</li>

#### •Status

- 85 groups have signed MoU with LIGO & Virgo
- From radio to gamma rays
- Special LVC GCN Notices and Circulars with distribution limited to partners

# LIGO and Virgo EM follow-up program

# **Now 85** MoUs involving

#### 160 instruments

(space and ground-based facilities) Broadband, radio – VHE gamma ray\_

Astronomical institutions, agencies and large/small groups of astronomers (20 countries)

#### In 2012, LVC agreed policy on releasing GW alerts

"Initially, triggers (partially-validated event candidates) will be shared promptly only with astronomy partners who have signed a Memorandum of Understanding (MoU) with LVC involving an agreement on deliverables, publication policies, confidentiality, and reporting.

After four GW events have been published, further event candidates with high confidence will be shared immediately with the entire astronomy community, while lower-significance candidates will continue to be shared promptly only with partners who have signed an MoU."

- First (2014), second (2015) and third (2016) open calls for participation in GW-EM follow-up program 85 MoUs signed
- http://www.ligo.org/scientists/GWEMalerts.php

# **Opening the GW window**

GW151226

GW15109 Abbott+16, PRL116,6

## GW151226 & LVT151012

Event	Dt (HL, ms)	Area of 90% Prob (90%)	Distance (Mpc)
GW150914	~7	~630	~420
GW151226	~1.1	~850	~440
LVT151012	~-0.6	~1600	~1000

#### The case of GW150914 follow-up

- t+few minutes: cWB & oLIB pipelines
  - T+17 min 14 hr (skymaps)
    - T+2d: first alert (after many checks)
      - T+3w (Oct 3): BBH identification
        - T+4m (Oct 20) updated FAR (<1/100 yr)

#### GW150914 sky maps

#### Localization pipelines

- cWB: constrained ML on sky grid
- LIB: bayesian inference
- BAYESTAR: triangulation (based on CBC pipelines, here offline)
- LALInference: full details

	Area <sup>a</sup>				Comparison <sup>c</sup>					
	10%	50%	90%	$\theta_{\rm HL}{}^{\rm b}$	cWB	LIB	BSTR	LALInf		
cWB	10	100	310	$43^{+2}_{-2}$		190	180	230		
LIB	30	210	750	$45^{+6}_{-5}$	0.55	0.55 —		270		
BSTR	10	90	400	$45^{+2}_{-2}$	0.64	0.56		350		
LALInf	20	150	620	$46^{+3}_{-3}$	0.59	0.55	0.90			

<sup>a</sup>Area of credible level (deg<sup>2</sup>). Note that the LALInference area is consistent with but not equal to the number reported in Abbott et al. (2016e) due to minor differences in sampling and interpolation.

<sup>b</sup> Mean and 10% and 90% percentiles of polar angle in degrees.

 $^{c}$  Fidelity (below diagonal) and the intersection in deg  $^{2}$  of the 90% confidence regions (above diagonal).

Abbott+16, ApJ 826, 13

## GW150914 coverage

- 25 teams involved
- 19 orders of magnitudes in wavelenghts
- Repointing (optical)
- Archival (X & gamma)
- Deep follow-up (optical/radio)

# X-rays and gamma rays

#### **Future perspectives: the role of Virgo**

Virgo will help in localization and parameter estimation

Credit: LIGO (Leo Singer) / Milky Way image (Axel Mellinger)

# Conclusions

- GW and photons provide complementary information
  - Multimessenger observations extremely promising
- Multimessenger approach is key to study the most extreme objects in the Universe
  - Natural laboratories to probe fundamental physics
  - Transients (e.g. GRBs)
  - Also, other sources (e.g. neutron stars)
- First GW events provided first tests for EM follow-up campaign
  - Great synergy and coverage
  - No expected EM emission from BBHs, but new interesting models arising
- Gamma-ray telescopes are important
  - Emission from GRBs and other HE sources
  - Large FoV
- Present & Future
  - Not just BBH: what about BNS/NSBH?
  - Advanced LIGO O2 ongoing
  - Advanced Virgo in commissioning

# Not just Virgo/LIGO...
