Spin Structure at Low Q^2 , with Applications to Hyperfine Splitting

Wednesday, 12 September 2018 15:50 (20 minutes)

Moments of spin structure functions at low Q^2 provide a benchmark test of chiral dynamics, and are necessary input for calculations of atomic energy levels. We will present the results from the Jefferson Lab Hall A and C spin structure experiments at low Q^2 ("g2p" and "SAGDH").
