Toward a proof-of-principle experiment of Optical Stochastic Cooling

Thursday, September 28, 2017 7:10 PM (20 minutes)

Owing to the superior bandwidth of amplifiers at optical wavelengths the Optical Stochastic Cooling (OSC) technique was first proposed more than 20 years ago as a radical improvement of the widely used Stochastic Cooling operating in the microwave regime. Fermilab is currently developing a proof-of-principle experiment of the OSC method using a 100-MeV electron beam circulating in the compact IOTA ring. The developed capabilities are generic and could have applications to optical manipulations of electron beams beyond OSC. This paper report on the development of an optical amplifier capable of amplifying undulator radiation along with simulations of the OSC insertion beamline.

Primary author: Mr ANDORF, Matthew (Northern Illinois University)

Co-authors: Dr RUAN, Jinhao (Fermi National Accelerator Laboratory); Dr PIOT, Philippe (Northern Illinois University); LEBEDEV, Valeri (Fermi National Accelerator Laboratory)

Presenter: Mr ANDORF, Matthew (Northern Illinois University)

Session Classification: WG3_Parallel

Track Classification: WG3 - Electron Beams from Electromagnetic Structures, Including Dielectric and Laser-driven Structures
