## Many-Body theory: projection Monte Carlo

We compute ground state energies of nuclei by means of projection Monte Carlo methods. The ground state of a many-body system is computed by applying an "imaginary time propagator" to an arbitrary state that has to be non-orthogonal to the ground state (power method):

$$
\langle R \mid \Psi(\tau)\rangle=\langle R| e^{-\left(\hat{H}-E_{0}\right) \tau}\left|R^{\prime}\right\rangle\left\langle R^{\prime} \mid \Psi(0)\right\rangle
$$

In the limit of "short" $\tau$ (let us call it " $\Delta \tau$ "), the propagator can be broken up as follows (Trotter-Suzuki formula):

$$
W\left(R, R^{\prime}, \Delta \tau\right)
$$

$$
\langle R| e^{-\left(\hat{H}-E_{0}\right) \Delta \tau}\left|R^{\prime}\right\rangle \sim e^{-\frac{\left(R-R^{\prime}\right)^{2}}{2 \frac{\hbar}{m} \Delta \tau}} e^{-\left(\frac{V(R)+V\left(R^{\prime}\right)}{2}-E_{0}\right) \Delta \tau}
$$

Potential term ("weight")

Sample a new point from the

## Gaussian kernel

$\left|R_{1}^{\prime}\right\rangle$

## Projection MC many-nucleon systems

Multicomponent wave functions are needed! How large is the system space? For a system of $A$ nucleons, $Z$ protons, the number of states is $2^{A}\binom{A}{Z}$

|  | $A$ | Pairs | Spin $\times$ Isospin |
| ---: | ---: | :---: | :---: |
| ${ }^{4} \mathrm{He}$ | 4 | 6 | $8 \times 2$ |
| ${ }^{6} \mathrm{Li}$ | 6 | 15 | $32 \times 5$ |
| ${ }^{7} \mathrm{Li}$ | 7 | 21 | $128 \times 14$ |
| ${ }^{8} \mathrm{Be}$ | 8 | 28 | $128 \times 14$ |
| ${ }^{9} \mathrm{Be}$ | 9 | 36 | $512 \times 42$ |
| ${ }^{10} \mathrm{Be}$ | 10 | 45 | $512 \times 90$ |
| ${ }^{11} \mathrm{~B}$ | 11 | 55 | $2048 \times 132$ |
| ${ }^{12} \mathrm{C}$ | 12 | 66 | $2048 \times 132$ |
| ${ }^{16} \mathrm{O}$ | 16 | 120 | $32768 \times 1430$ |
| ${ }^{40} \mathrm{Ca}$ | 40 | 780 | $3.6 \times 10^{21} \times 6.6 \times 10^{9}$ |
| ${ }^{8} \mathrm{n}$ | 8 | 28 | $128 \times 1$ |
| ${ }^{14} \mathrm{n}$ | 14 | 91 | $8192 \times 1$ |

Number of states in many nucleon wave functions for a few selected nuclei

- Very accurate results, possibility of using accurate wave functions for the evaluation of general estimators (e.g. response functions
- Due to the high computational cost, application limited so far to $A \leq 12$ : COMPUTATIONAL

## CHALLENGE!

## AFDMC

The operator dependence in the exponent has become linear.
In the Monte Carlo spirit, the integral can be performed by sampling values of x from the Gaussian $e^{-\frac{x^{2}}{2}}$. For a given $x$ the action of the propagator will become:

$$
e^{-x \sqrt{\lambda \Delta \tau} \hat{O}_{n}}|S\rangle=\prod_{k=1}^{3 A} e^{-x \sqrt{\lambda \Delta \tau} \phi_{n}^{k} \sigma_{k}}|S\rangle
$$

In a space of spinors, each factor corresponds to a rotation induced by the action of the Pauli matrices

The sum over the states
has been replaced by sampling rotations!

## AFDMC

The crucial advantage of AFDMC is that the scaling of the required computer resources is no longer exponential: the cost scales as $\boldsymbol{A}^{\mathbf{3}}$ (the scaling required by the computation of the determinants in the antisymmetric wave functions) $\rightarrow$ LARGER SYSTEMS

## ACCESSIBLE!

Progress

- The HS transformation can be used ONLY FOR THE PROPAGATOR Accurate wave functions require an operatorial dependence! "Cluster expansion" introduced and working!(Gandolfi, Lovato, Schmidt)
- Some problems in treating nuclear spin-orbit have been addressed.
- Three-body forces are now implemented in a quasi-perturbative way, but results are very promising.

## Fock space calculations

The stochastic power method can also be used in Fock space. In this case the propagator acts on the occupation number of a basis set used to span the Hilbert space of the solution of a given Hamiltonian. In particular, given two basis states $|\mathbf{m}\rangle$ and $|\mathbf{n}\rangle$ the quantity:

$$
\langle\mathbf{m}| \mathcal{P}_{\Delta \tau}|\mathbf{n}\rangle=\langle\mathbf{m}| 1-\left(\hat{H}-E_{0}\right) \Delta \tau|\mathbf{n}\rangle
$$

is interpreted as the probability of the system of switching the occupation of the state $|\mathbf{n}\rangle$ into the occupation of the state $|\mathbf{m}\rangle$. This propagation has in principle the same properties of the coordinates space version.

## Equation of state of dense matter

The fine tuning of the hyperon-nucleon interaction is essential to understand the behaviour of matter in extreme conditions.

Internal composition still largely unknown

## Effective $\pi$-less theories

L.Contessi, A. Lovato, FP, J. Kirscher, U. van Kolck, N.Barnea, D. Gazit

Plan: build a $\pi$-less effective Hamiltonian in coordinate space on few-body system and check the results for nuclei with larger masses.
Test: a nuclear physics with $m_{\pi}=800 \mathrm{MeV}$ LQCD calculations available for $\mathrm{A}=3,4$

$$
\begin{gathered}
V_{L O}=C_{1}^{L O}+C_{2}^{L O} \sigma_{1} \cdot \sigma_{2} \\
V_{L O}^{3 b}=D_{1} \tau_{1} \cdot \tau_{2}
\end{gathered}
$$

Regularization in $r$ space

$$
\begin{gathered}
V_{L O}(r)=\left(C_{1}^{L O}+C_{2}^{L O} \sigma_{1} \cdot \sigma_{2}\right) I_{0}(\Lambda, r) \\
I_{k}(\Lambda, r)=\Lambda^{k} e^{-\Lambda^{2} r^{2} / 4}
\end{gathered}
$$

## Fułure needs

- The scaling on the KNL partition of Marconi at CINECA is decent, but not perfect.

33 neutrons $0.04 \mathrm{fm}^{\wedge}-3$
VMC 25 equilibrium blocks, 25 average blocks, 10 steps/block

| walkers | cpu | nodes | cpu-time [h] | job-time [min] |
| :---: | :---: | :---: | :---: | :---: |
| 68 | 68 | 1 | 2.934 | 2.591 |
| 136 | 68 | 1 | 5.160 | 4.560 |
| 340 | 68 | 1 | 11.650 | 10.268 |
| 136 | 136 | 2 | 6.215 | 2.748 |
| 272 | 136 | 2 | 10.814 | 4.767 |

Calculation of the EoS on about 10 points for a single model requires ~ 1M hours

- Calculations for ${ }^{40} \mathrm{Ca}$ with pi-less EFT interactions (LO only) would presently require $\sim 4$ Mhours (a factor 40 with respect to ${ }^{16} \mathrm{O}$ ). Repeating ${ }^{16} \mathrm{O}$ calculations with operatorial-dependent correlations would require 2.5Mchrs (a factor 256 with respect to present calculations). A similar estimate holds for calculations of $\wedge 39 \mathrm{~K} / 39 \mathrm{~K}$ required in preparation of the approved hypernuclear program at JLab.
- Considering the already available resources (therefore excluding possible resources coming from grants) a reasonable request of resources from INFN would be 7Mchrs for 2018, 10Mchrs for 2019 and 13Mchrs for 2020, for a total of 30Mchrs over the 3 years. This would in principle accommodate also similar (scaled) needs of the other groups.
