

# Identification of extreme blazar candidates in X-ray catalogs

Preliminary!

1ES0229+200

# Outline

- What are AGNs?
- What is a blazar?
- What is an extreme blazar?
- What is our research strategy?

# Active Galactic Nuclei

A famous AGN: Centaurus A

In optical...

...and infrared!

# Active Galactic Nuclei

Suppose you are looking at the Virgo Cluster in the sky...

# AGN: the structure

Main components:

- Supermassive black hole
- Accretion disk
- Torus
- Broad and narrow line regions
- Some of them have relativistic jets

# The view point

# FSRQ vs BL Lacs

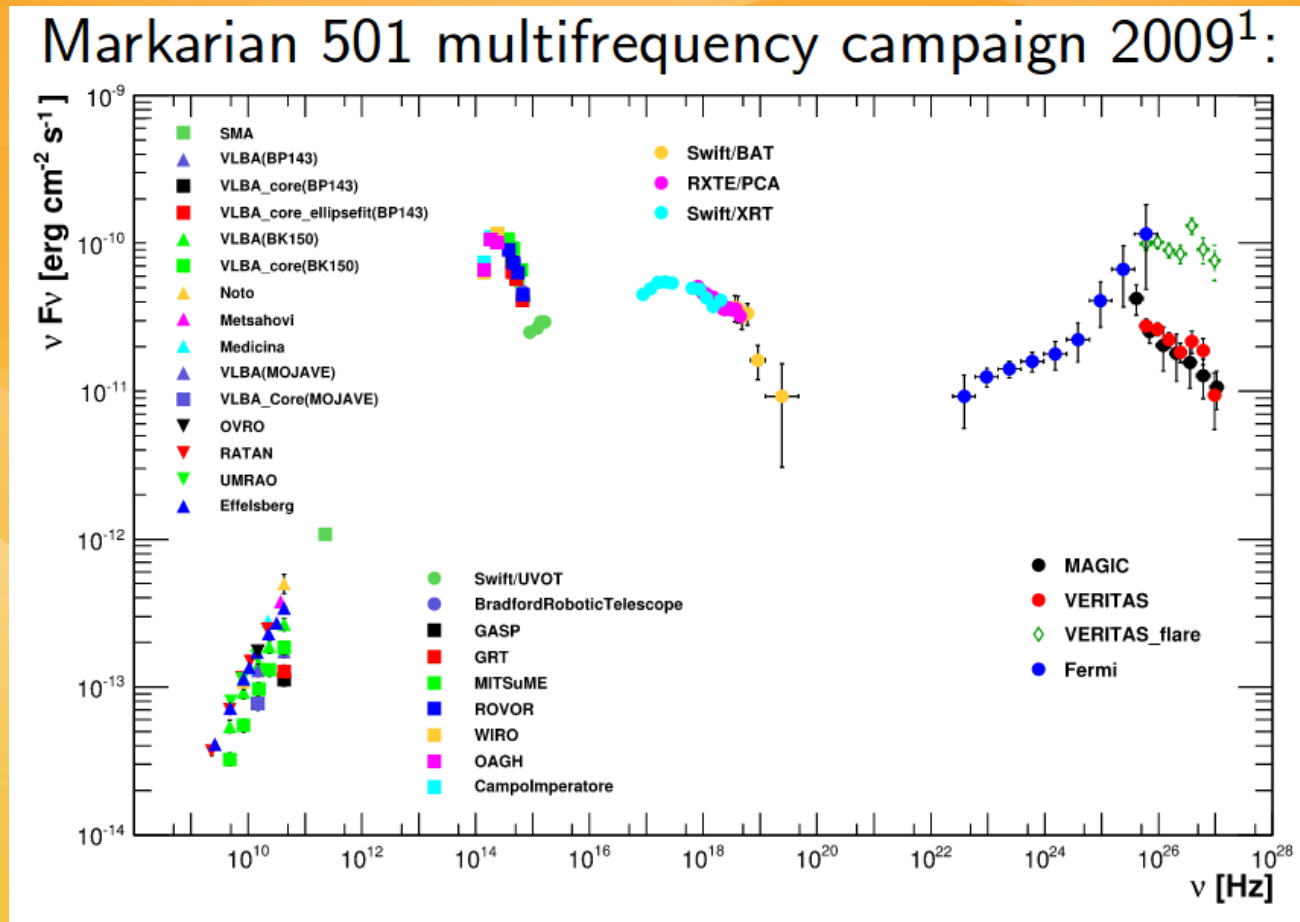

**Blazars** are divided into:

- **Flat spectrum radio quasars**: emission and absorption lines are present
- **BL Lac's type objects**: no spectral lines

Probably due to the different environment around the AGN.

Maybe BL Lac objects are more advanced in the evolution history of FSRQ

# Blazar typical spectrum

# Blazar typical spectrum

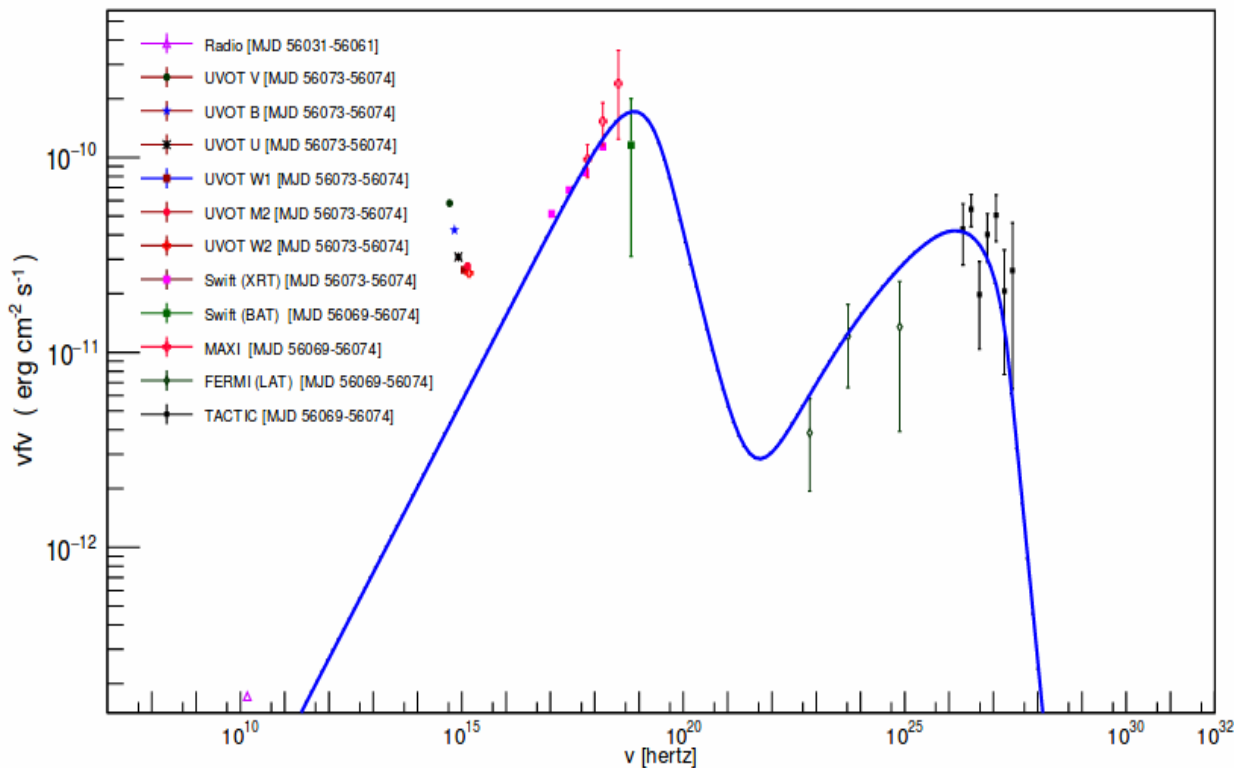

Figure 6: Spectral energy distribution for Mrk 501 during 22-27 May, 2012. The legend report instrument and duration in MJD. The TeV data from TACTIC have been corrected for the absorption due to extragalactic background light using the model reported in Franceschini model [49].

# The main model: SSC

Ref.: Maraschi e Tavecchio 2003

- Spherical and homogeneous emission region around the black hole
- Electrons are electromagnetically accelerated in the jet
- Electrons suffer synchrotron losses and produce photons in the optical to Xray band
- These photons are partly upscattered to VHE due to inverse compton scattering by the very same electrons

→ today is the fundamental model: it is successfull describing the double humped SED of BL Lac objects

→ it needs other contributions to describe details: external compton, hadronic models...

# The main model: SSC

Ref.: Maraschi e Tavecchio 2003

## Parameters:

- **R** radius of the emitting region
- **B** magnetic field
- $\Gamma$  Lorentz factor
- $\Theta$  jet angle with respect to us
- **K** normalization factor in the electron distribution function  $N(\gamma)$
- **$\gamma$ -min** and  **$\gamma$ -max**: range of energy described by  $N(\gamma)$
- **n** spectral index or indexes

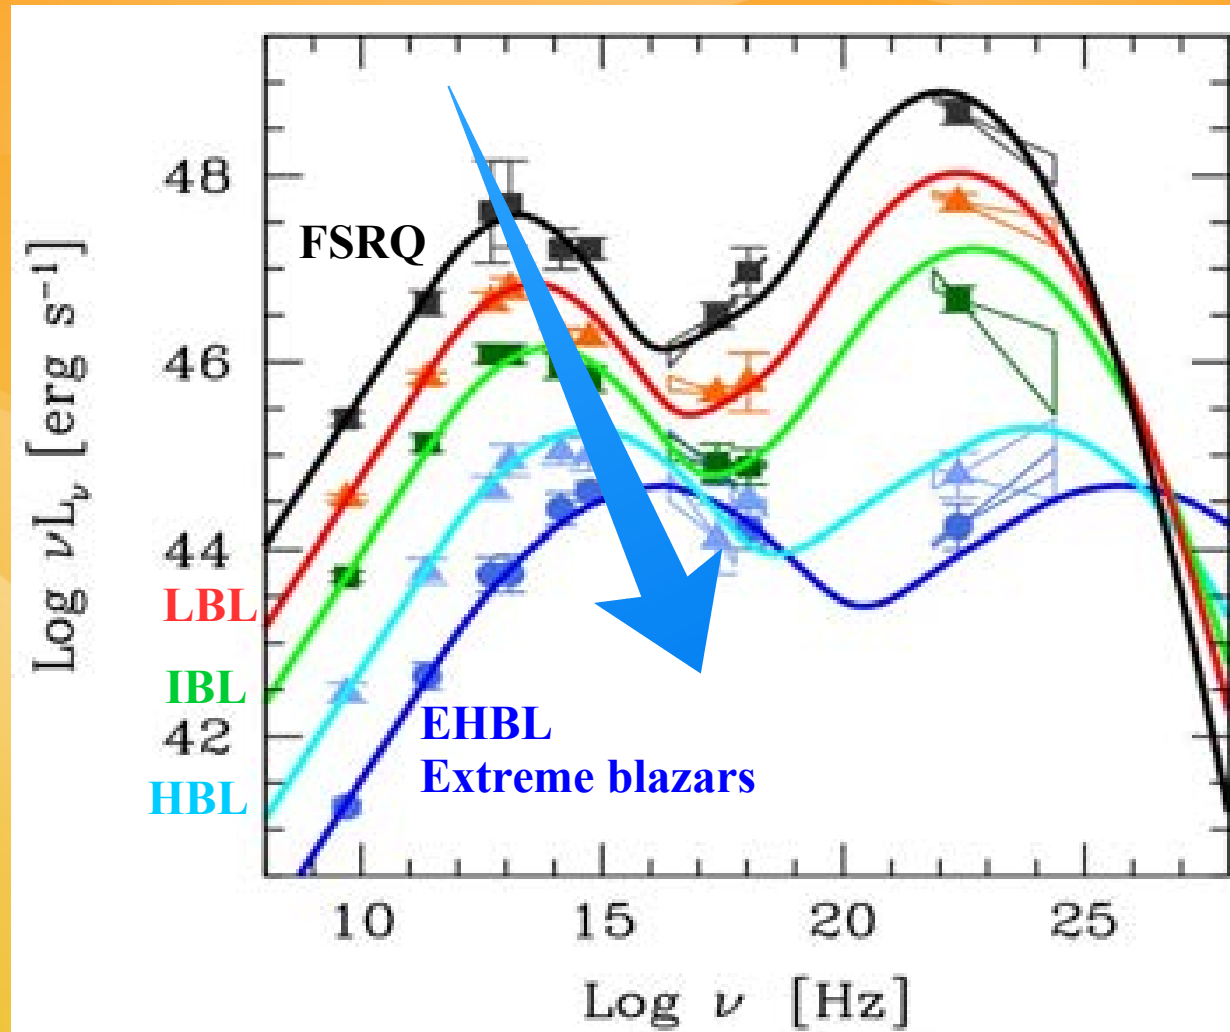

# The main model: SSC

Ref.: Ghisellini 2013

# Blazar sequence

Ref.: Fossati et al 1998

# The archetypal of EHLB 1ES 0229+200

Ref.: Kaufmann et al 2011

1ES0229+200

# Extreme blazars

Spectral properties and criteria:

- High **maximum synchrotron peak frequency**  
 $> 10^{18}$  hard X-rays
- Very high “**inverse compton**” peak frequency  
 $> 10^{26}$  VHE
- **Hard spectrum** in X-ray and Gamma-ray
- Relatively **small luminosity** in comparison with FSRQ
- Detectable host **galaxy**
- Potentially absorbed in the VHE due to **EBL**
- Probably **not well detected in the HE** (Fermi)

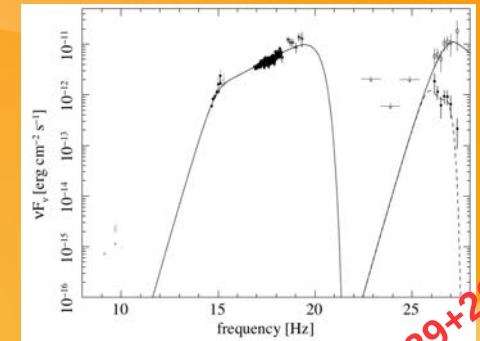

1ES0229+200

# Extreme blazars

## Why to study them?

- SSC model is not completely successful  
→ unknown emission mechanism
- Extremely energetic
- New category to be populated
- Challenge for new telescopes
- Multiwavelength analysis needed
- Neutrinos source?

# **BAT vs Fermi 3LAC**

# BAT vs Fermi 3LAC

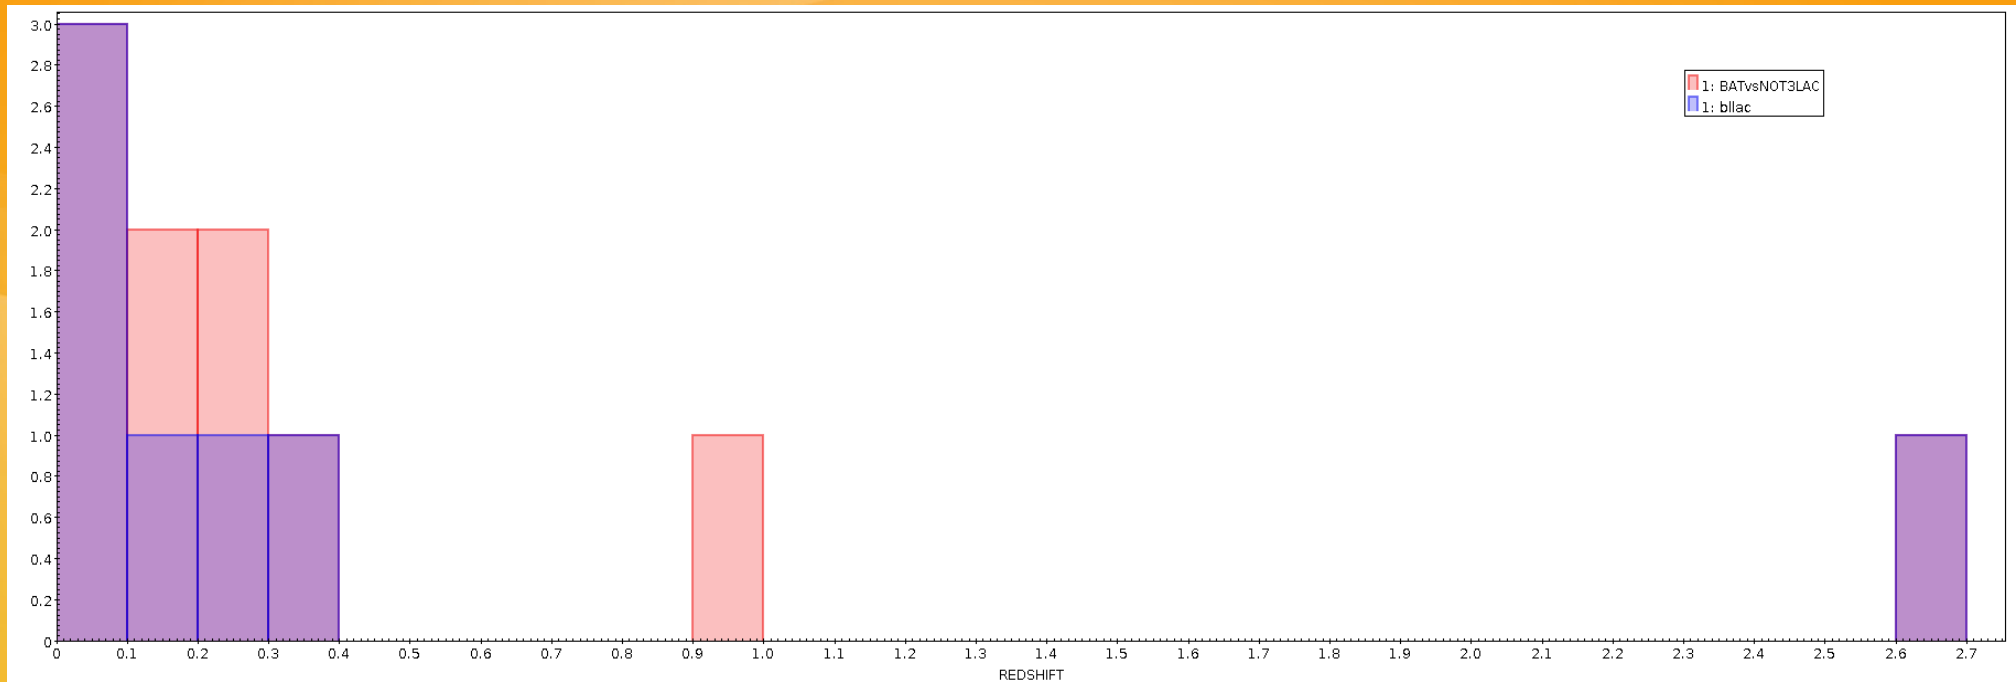

- **Common blazars** between BAT and 3LAC: **39**  
**39** 3LAC's blazars over 49 BAT's sources (79%)
  - **19 FSRQ** (indicated as “blazar” in BAT)
  - **20 BL Lac**
- And what about the remaining **10 blazars**?

# BAT vs Fermi 3LAC

- BAT blazars **undetected** by 3LAC: **10 sources**
  - **3** indicated as “**blazar**” in BAT, maybe 2 of them are Sy
  - **7 BL Lac**

COUNTERPART_NAME	TYPE	REDSHIFT
RBS 0315	BL Lac	2.69
4C +10.08	BL Lac	0.07
PKS 0521-36	BL Lac	0.05534
PKS 0723-008	Bl Lac	0.128
Mrk 205	BL Lac	0.07085
RBS 1640	Blazar / Sy1.5	0.137
4C +34.47	Blazar / Sy1	0.206
4C +73.18	BL Lac LPQ	0.3021
PKS 2145+06	Blazar	0.99
1RXS J225146.9-320614	BL Lac	0.246

# Redshift distribution

**BAT blazars NOT in 3LAC**

- **NED: radio jetted**
- **Angle  $\sim 53/57^\circ$**
- **Size  $\sim 0.84$  Mpc!**

# 4C 73.18

# PKS 2145+06

# 1RXSJ225145-320614

# 1RXSJ225145-320614

- **NED: candidate BL LAC**
- **Detected in 1WHSP as candidate BLLAC with unknown redshift and log nu peak > 18**
- **Low flux in Xray in 2whsp**
- **Different names!!**

# Conclusions

- EHLB candidates:
    - 4C 10.08
    - 1RXSJ225145-320614
    - RBS 1640
    - 4C 34.47 (?)
    - MRK 205 (?)
- at least 3 sources to be studied better!

# Conclusions

- How to continue?
  - Analysis in X-ray and Fermi
  - Analysis of literature of the sources
  - Proposal for observations with telescopes (MAGIC, Nustar...?)
  - Other suggestions are welcome! :)

*Thank you!*
