

# Direct measurement of the 64.5 keV resonance strength in the $^{17}\text{O}(p,\alpha)^{14}\text{N}$ reaction at LUNA

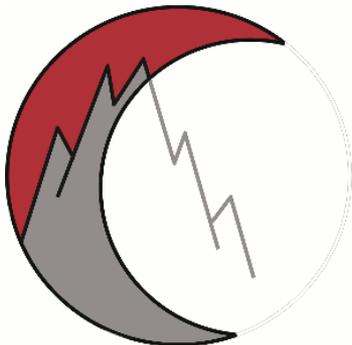

Carlo G. Bruno

Edinburgh University

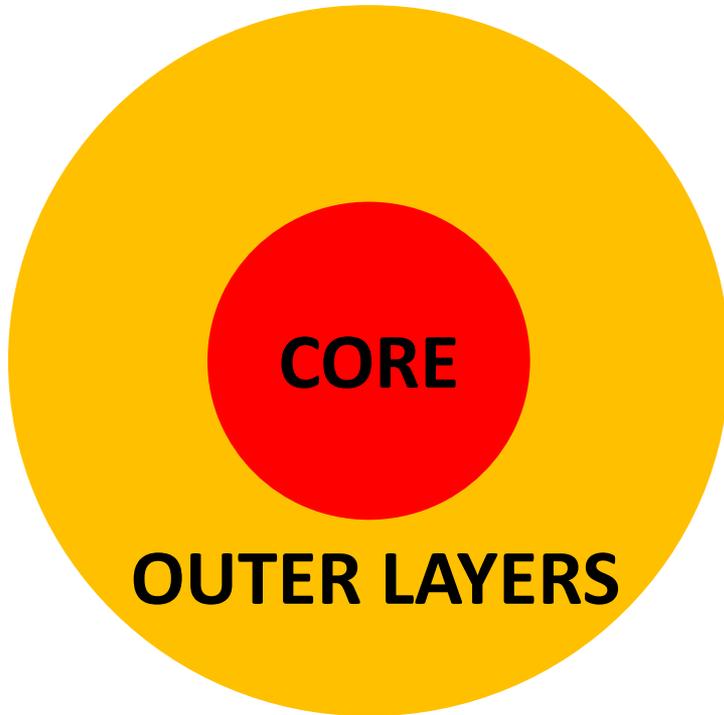

5 Ottobre 2017

GIANTS - Bologna

LUNA

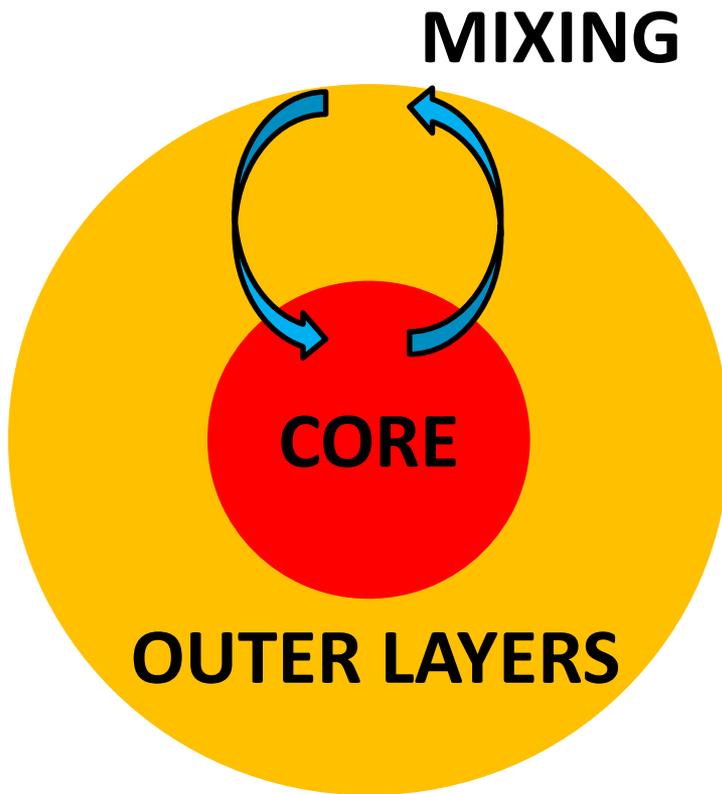

# ASTROPHYSICAL MOTIVATION

- **Giant Branch stars**
- Burn hydrogen via CNO cycle in the core ( $T=0.03-0.1$  GK)
- CNO signature = isotopic abundance pattern at equilibrium
- CNO signature observed in outer layers!

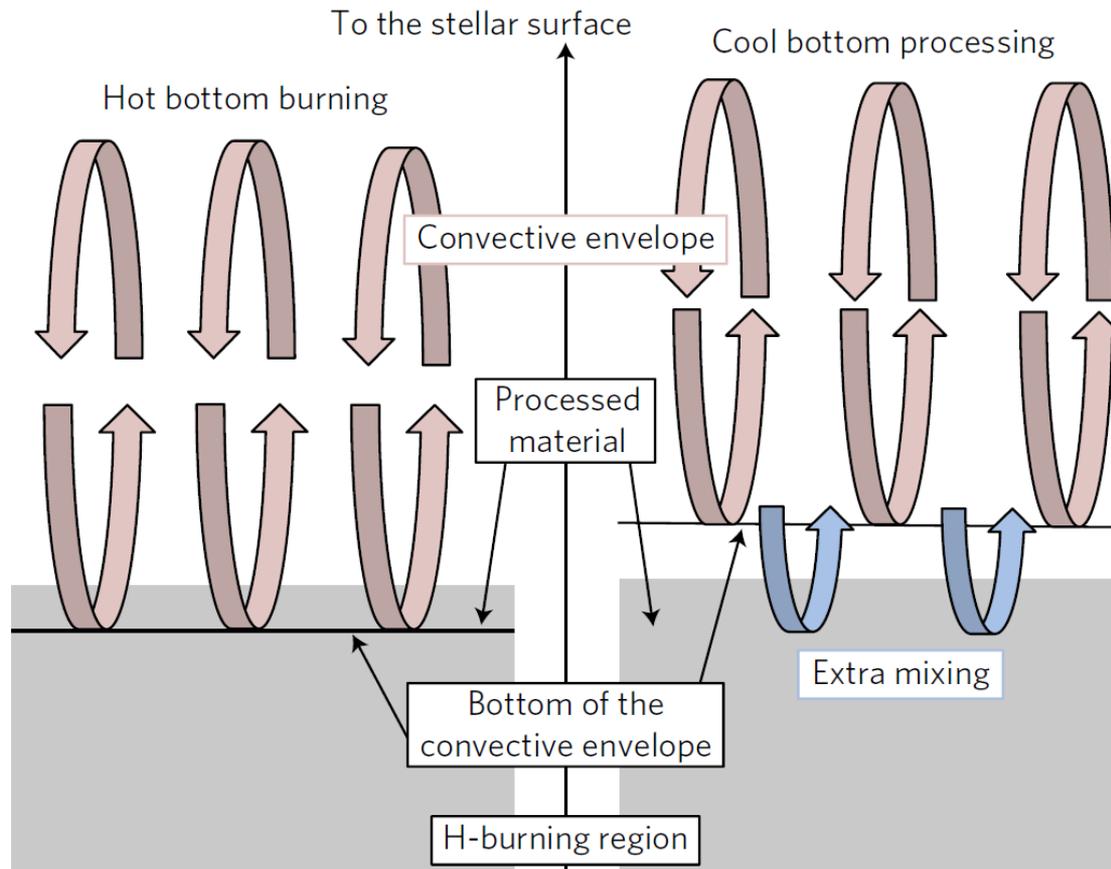

# ASTROPHYSICAL MOTIVATION

- **Giant Branch stars**
  - Burn hydrogen via CNO cycle in the core ( $T=0.03-0.1$  GK)
  - CNO signature = isotopic abundance pattern at equilibrium
- CNO signature observed in outer layers!
- Convective / recirculating processes carry CNO products to outer layers
- Physical nature often unknown
- Affect reliability of stellar evolution models

# MIXING PROCESSES

- How can we study these unknown mixing processes?
- Trace them with CNO isotopes
- $^{17}\text{O}$  is an ideal tracer for HBB / CBP

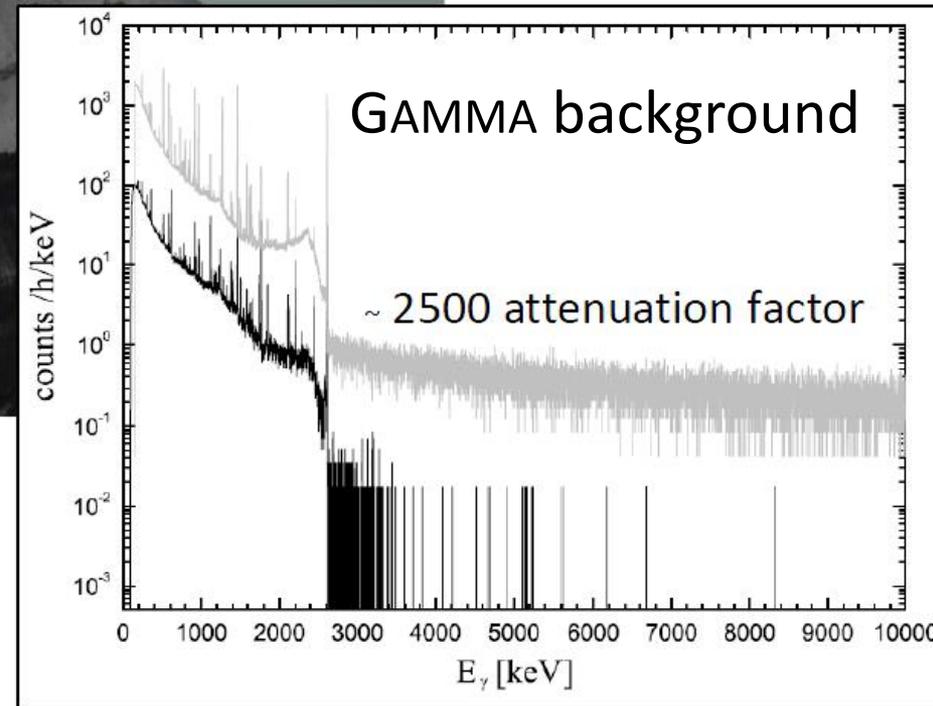

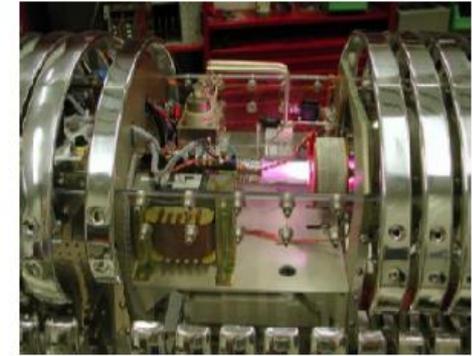

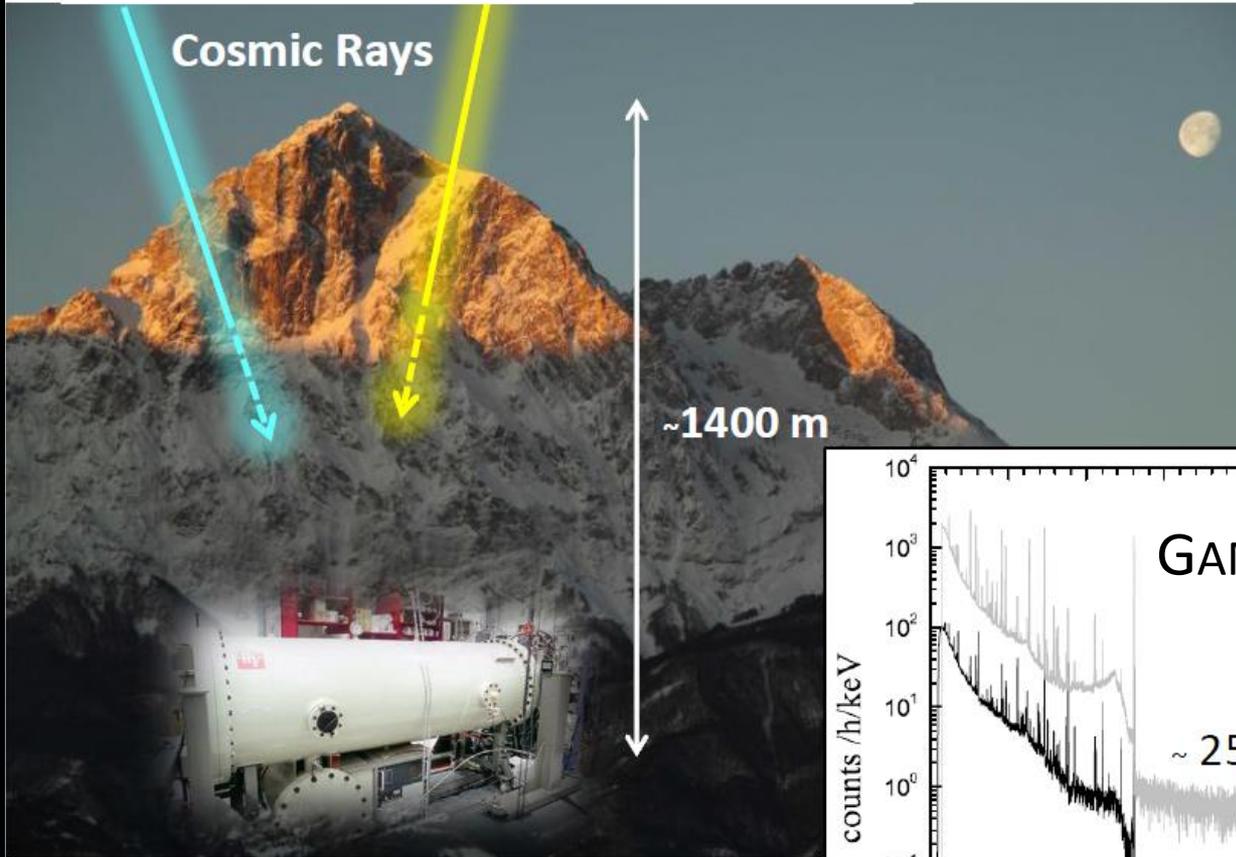

# AIMS

- Stellar models are affected by uncertainties in  $^{17}\text{O}/^{16}\text{O}$  and uncertainties come primarily from **destruction** rate of  $^{17}\text{O}$
- $^{17}\text{O}(\text{p},\alpha)^{14}\text{N}$
- **Our aim:** study this reaction at relevant energies to reduce the uncertainties in the  $^{17}\text{O}$  isotopic abundances
- Very low counting rates expected:  $\sim 1$  count/h
- Natural background will be a problem. How do we solve this?

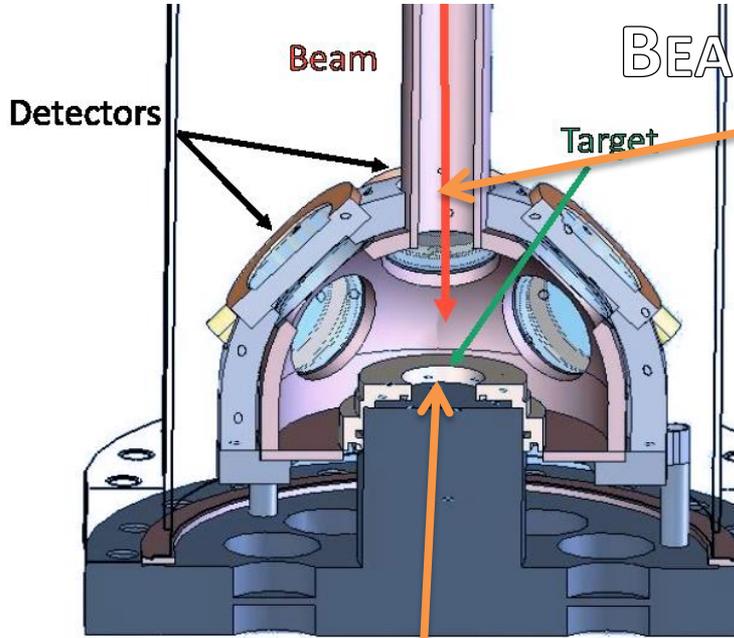

# THE LUNA EXPERIMENT

THE LUNA EXPERIMENT

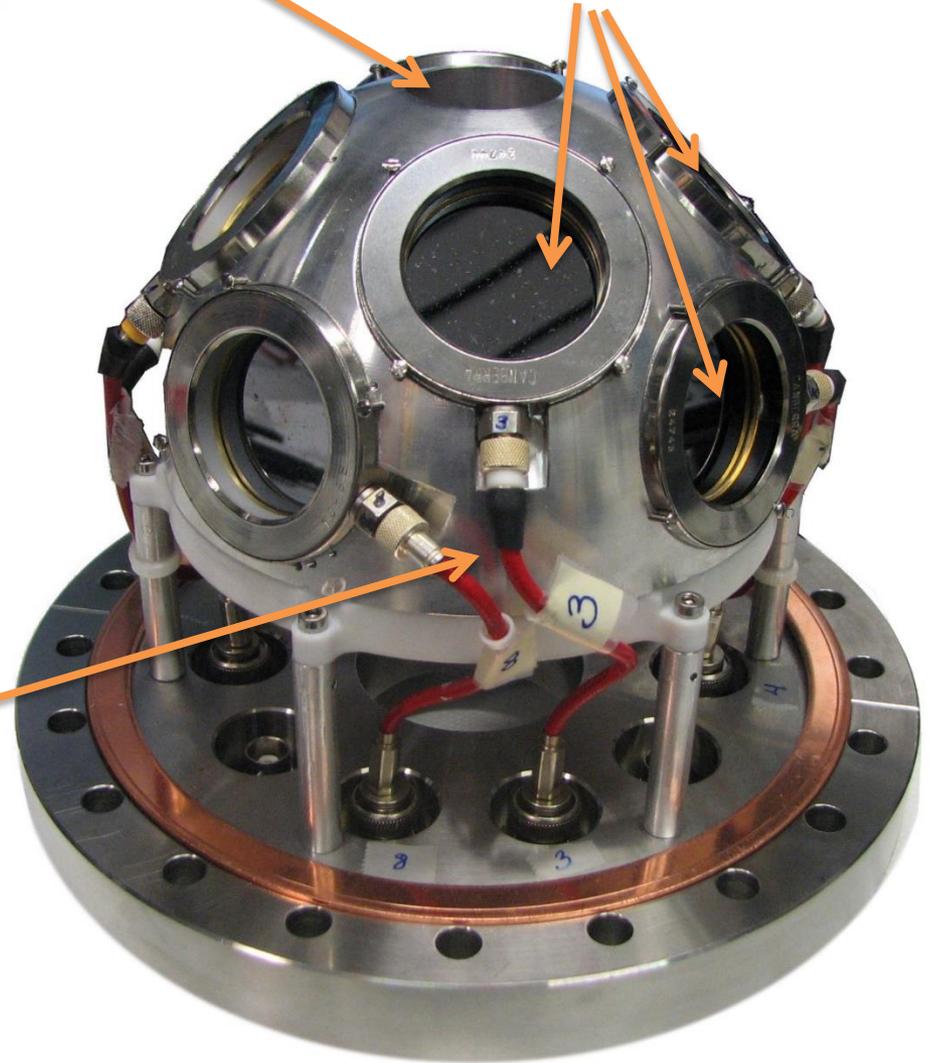

Thanks to the natural shielding of Gran Sasso Laboratory, background will be significantly reduced, allowing a direct measurement.

# REACTION CHAMBER

SILICON DETECTORS  
( 8 IN TOTAL )

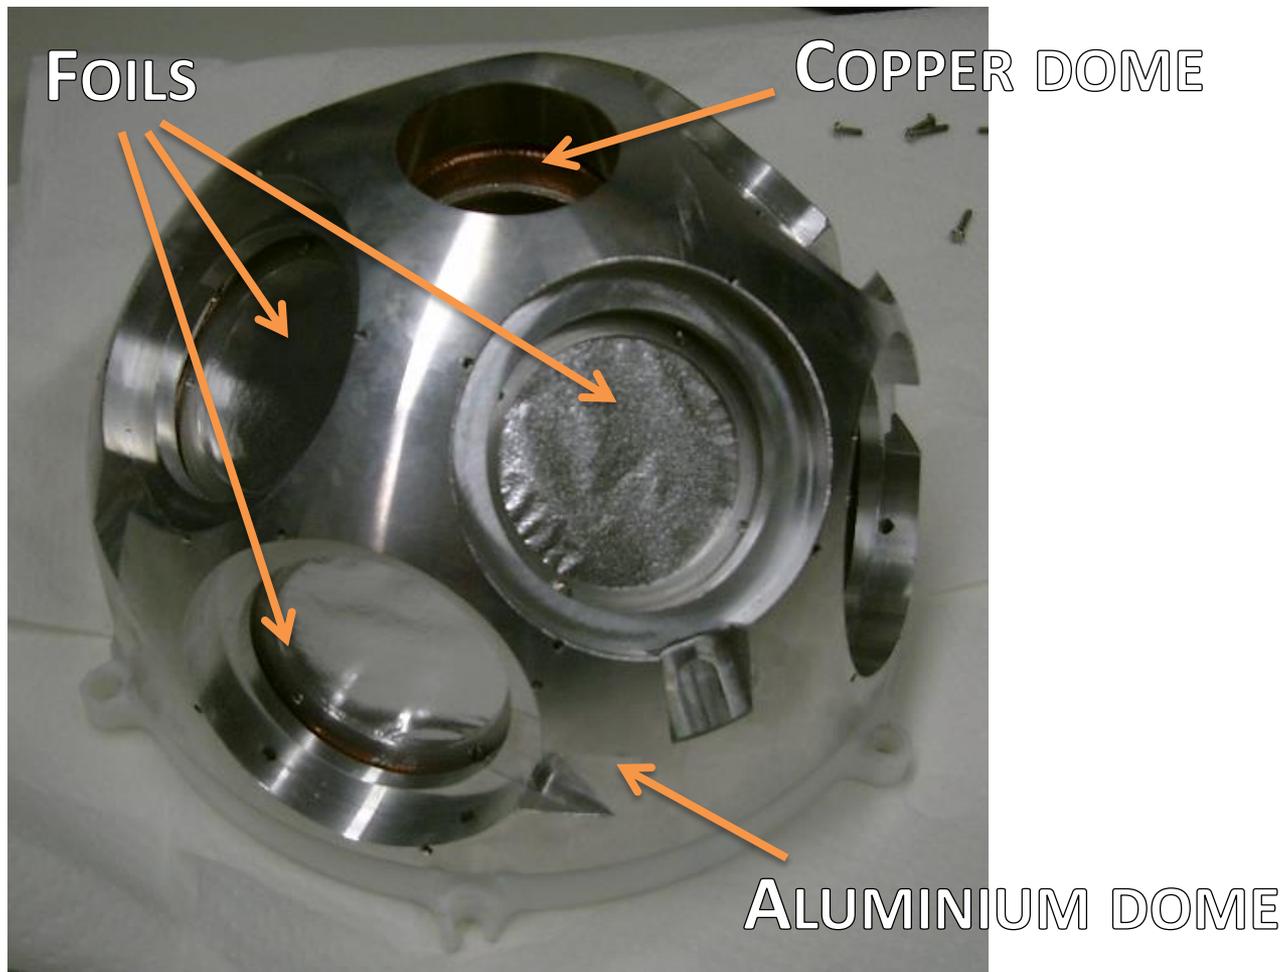

SOLID TARGET POSITION

EXPERIMENTAL SETUP

# THE FOILS

- **Back-scattering protons will hit the silicon detectors**
  1. Will damage detectors
  2. Will increase background
- Foils mounted to shield detectors
- **Foils must be:**
  1. Thick to stop protons
  2. Thin to let alphas through
  3. Homogeneously thick, rugged, free of pinholes ...
- **Finding a compromise was difficult**
- Aluminised Mylar, roughly  $2.4\mu\text{m}$  thick, was chosen
- For  $^{17}\text{O}(p,\alpha)^{14}\text{N}$ : 200 keV protons stopped and 1 MeV alpha particles detected at 200-250 keV

# THE FOILS

# THE FOILS

# BACKGROUND REDUCTION IN SI DETECTORS

- Advantage of moving underground for gamma spectroscopy is well-established
- What about alpha spectroscopy?
- Does a **lead castle** help?
- We compared the background in Edinburgh and Gran Sasso

## GRAN SASSO

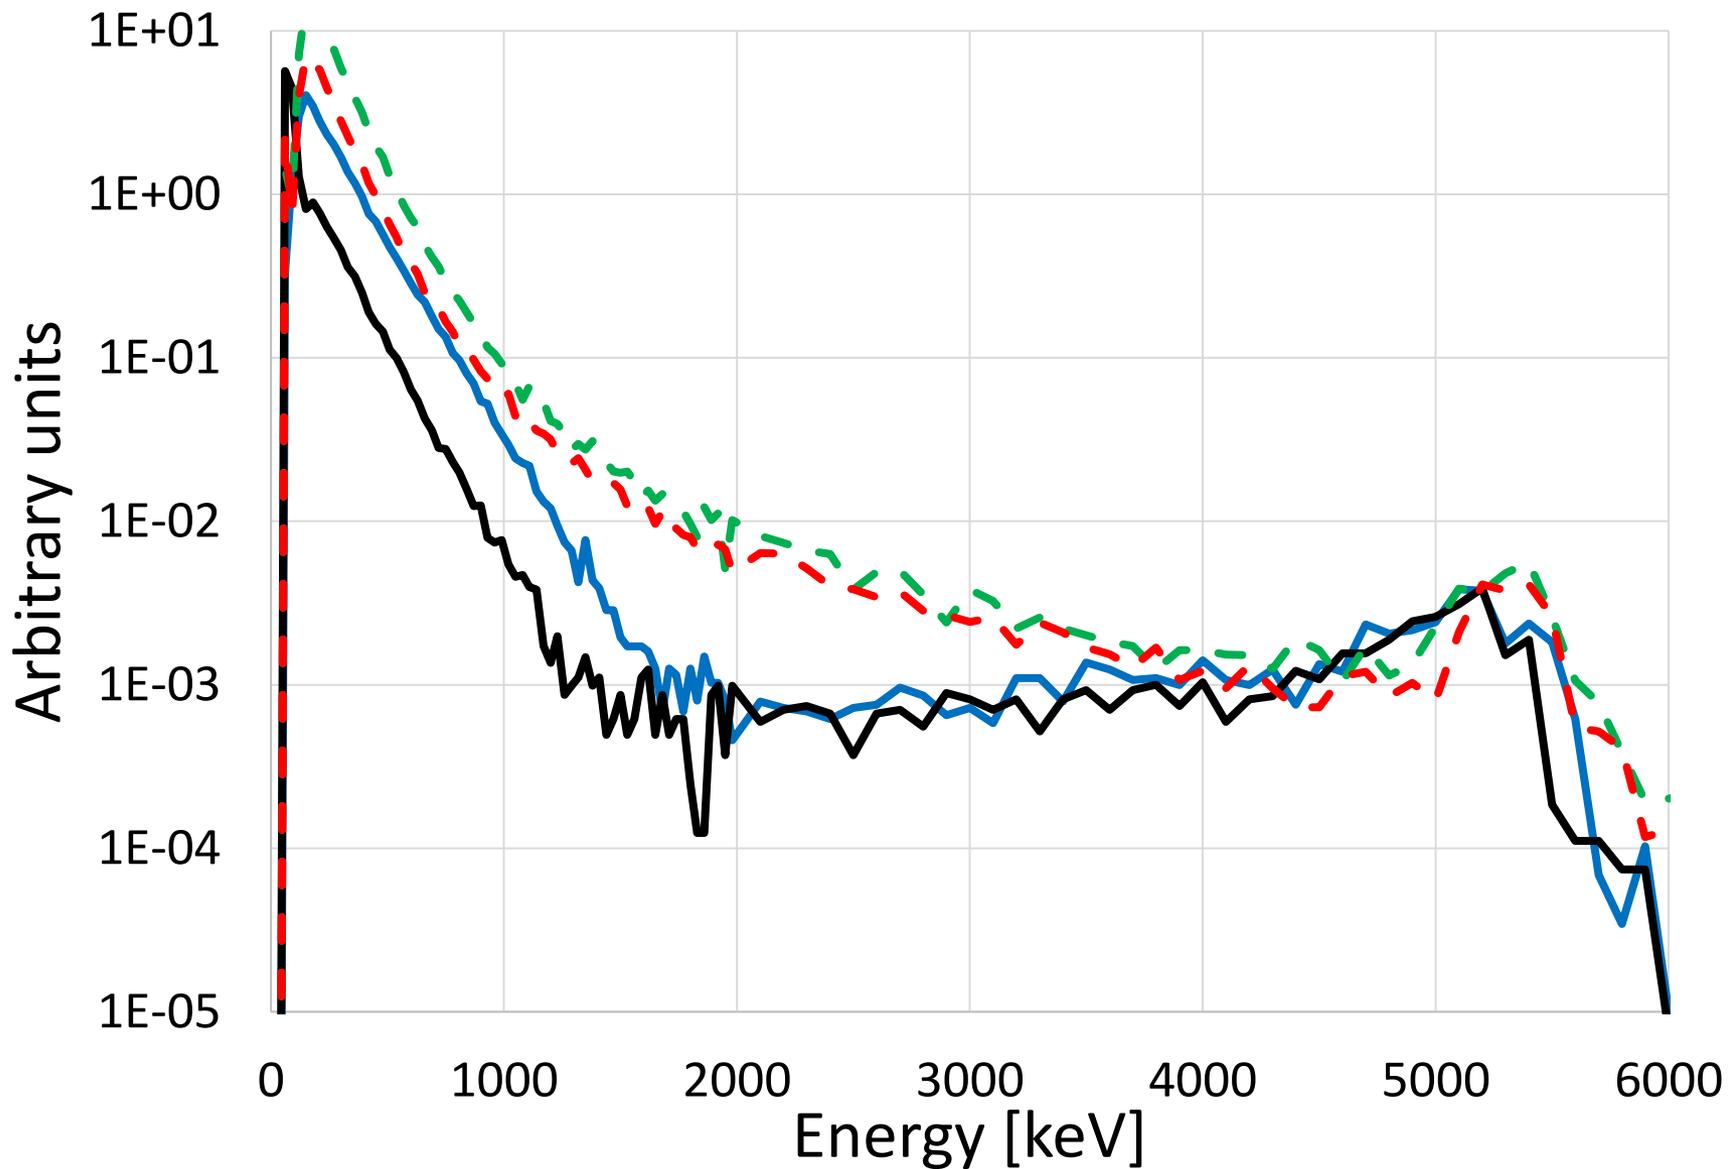

## EDINBURGH

# BACKGROUND REDUCTION IN SI DETECTORS

— Underground — Underground+Pb - - Overground - - Overground+Pb

BACKGROUND REDUCTION

# Resonance strengths in the $^{17,18}\text{O}(p, \alpha)^{14,15}\text{N}$ reactions and background suppression underground

## Commissioning of a new setup for charged-particle detection at LUNA

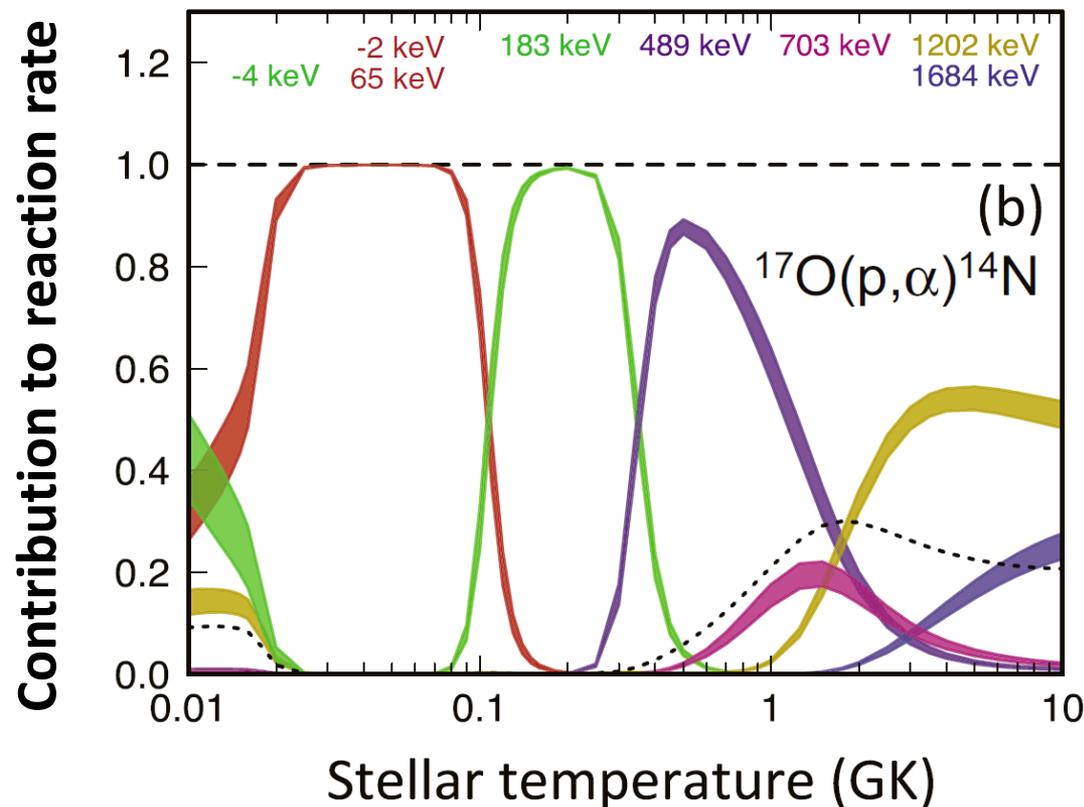

LUNA Collaboration

Brogini<sup>4</sup>, A. Cacioli<sup>4,5</sup>, F. Cavanna<sup>6</sup>, P. Corvisiero<sup>6</sup>, R. Depalo<sup>4,5</sup>, A. Di Leva<sup>7</sup>, Z. Elekes<sup>8</sup>, Zs. Fülöp<sup>8</sup>, G. Gervino<sup>9</sup>, C.J. Griffin<sup>1</sup>, A. Guglielmetti<sup>10</sup>, C. Gustavino<sup>11</sup>, Gy. Gyürky<sup>8</sup>, G. Imbriani<sup>7</sup>, M. Junker<sup>2</sup>, R. Menegazzo<sup>4</sup>, E. Napolitani<sup>5</sup>, P. Prati<sup>6</sup>, E. Somorjai<sup>8</sup>, O. Straniero<sup>2,12</sup>, F. Strieder<sup>13</sup>, T. Szücs<sup>3</sup>, and D. Trezzi<sup>10</sup>

# NUCLEAR PHYSICS ASPECTS

- Q-value = 1.2 MeV. Alpha energy at emission = 1 MeV
- After foils: alpha energy = 200 - 250 keV
- Two narrow resonances at **70** and **193** keV (Lab. frame)
- Resonances dominant at astrophysical temperatures
- **AIMS: measure  $E_p=70$  and 193 keV resonances**

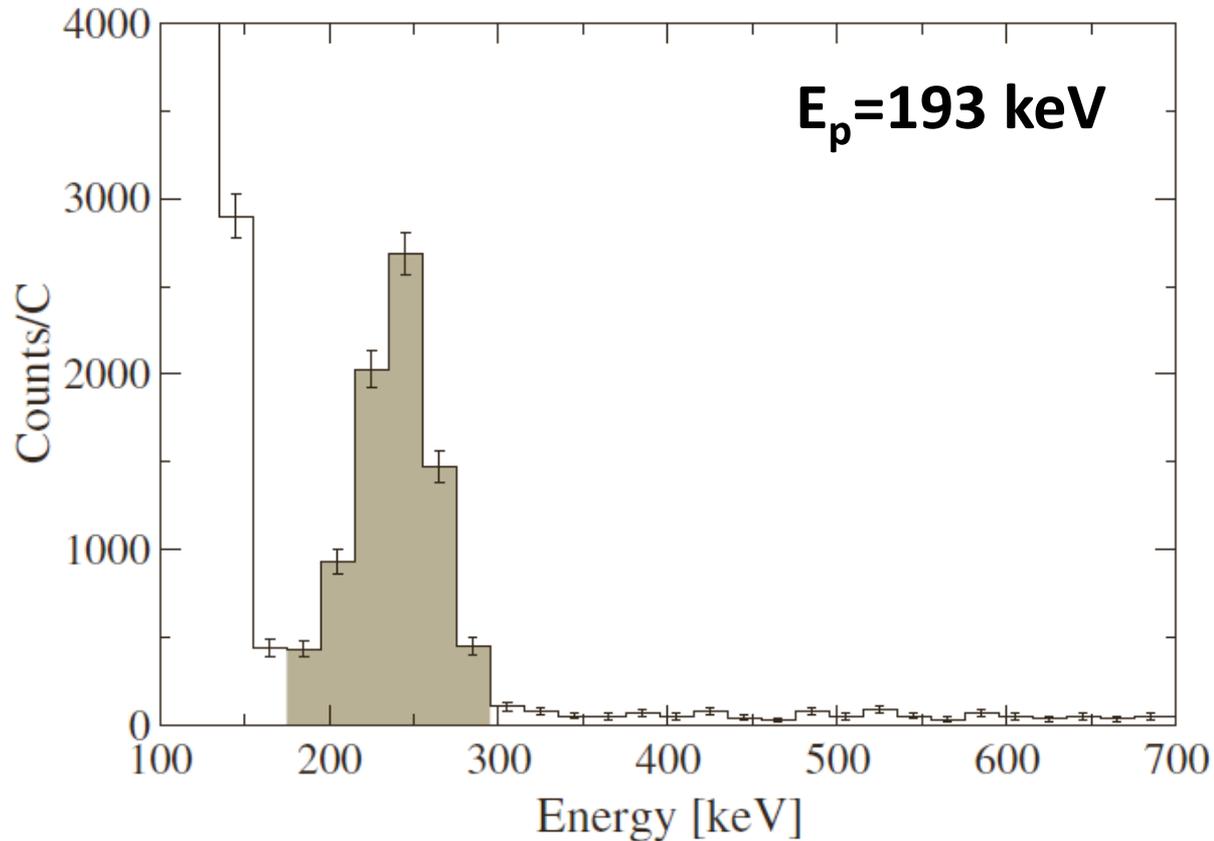

Buckner et al.,  
PRC **91** (2015)

# FINDING THE REGION OF INTEREST

- Counting rate at  $E_p=193$  keV  $\rightarrow$  8000 counts/C (OK!)
- Counting rate at  $E_p=70$  keV  $\rightarrow$  few counts/C (very low!)
- How do we find the signal at  $E_p=70$  keV?

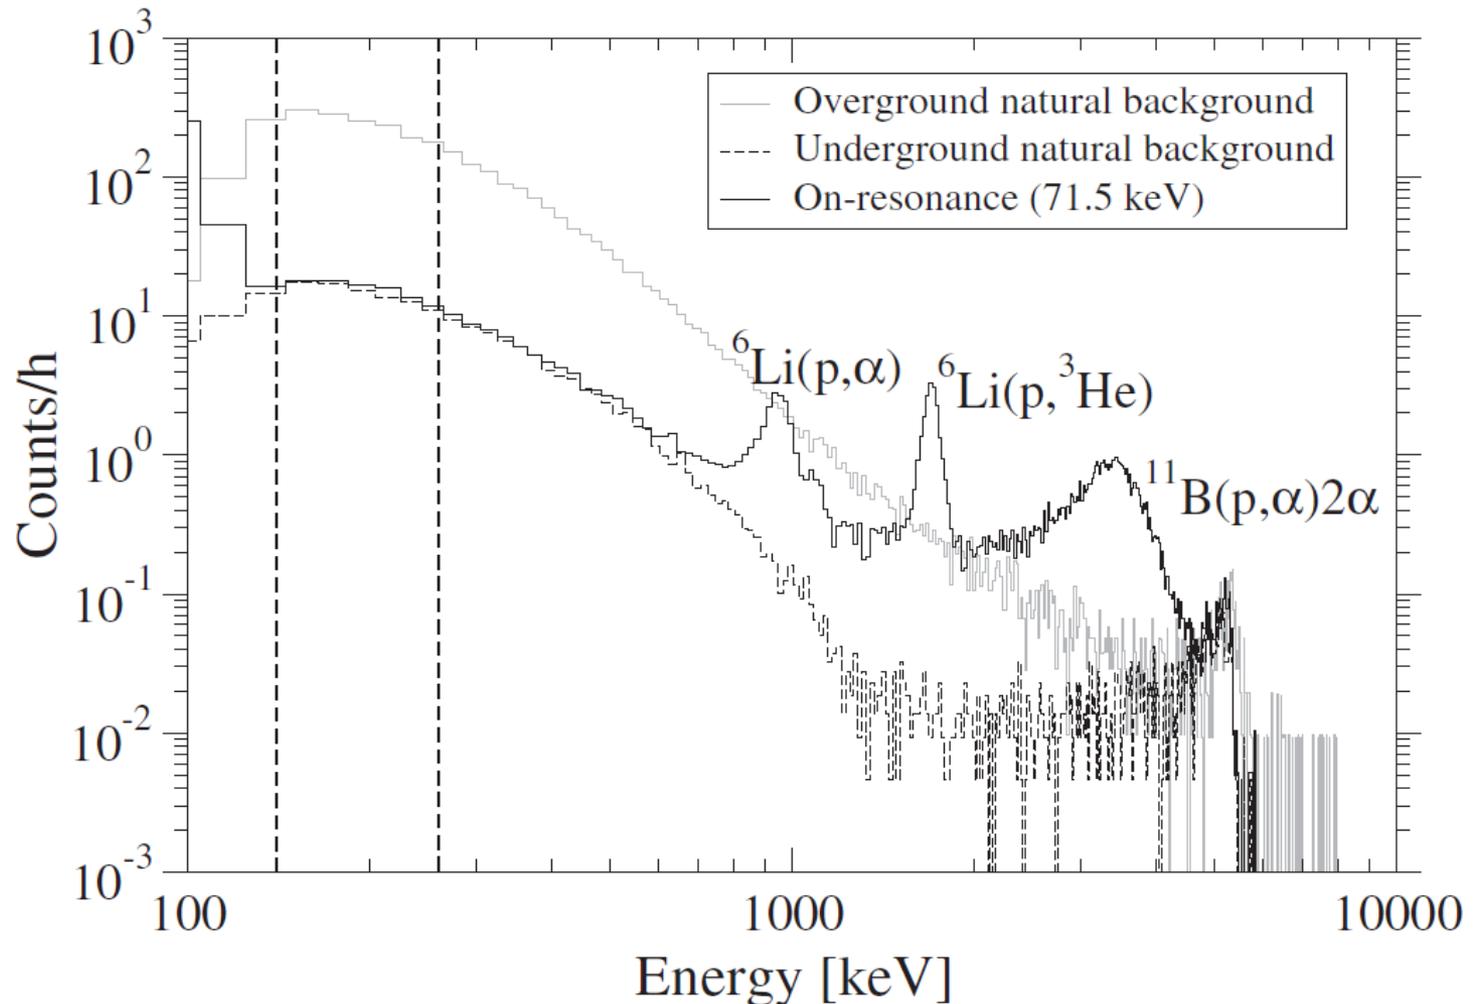

# FINDING THE REGION OF INTEREST

- Counting rate at  $E_p=193$  keV -> 8000 counts/C (OK!)
- Counting rate at  $E_p=70$  keV -> few counts/C (very low!)
- How do we find the signal at  $E_p=70$  keV?
- Define a ROI at  $E_p=193$  keV
- Use ROI defined at  $E_p=70$  keV (small correction needed)

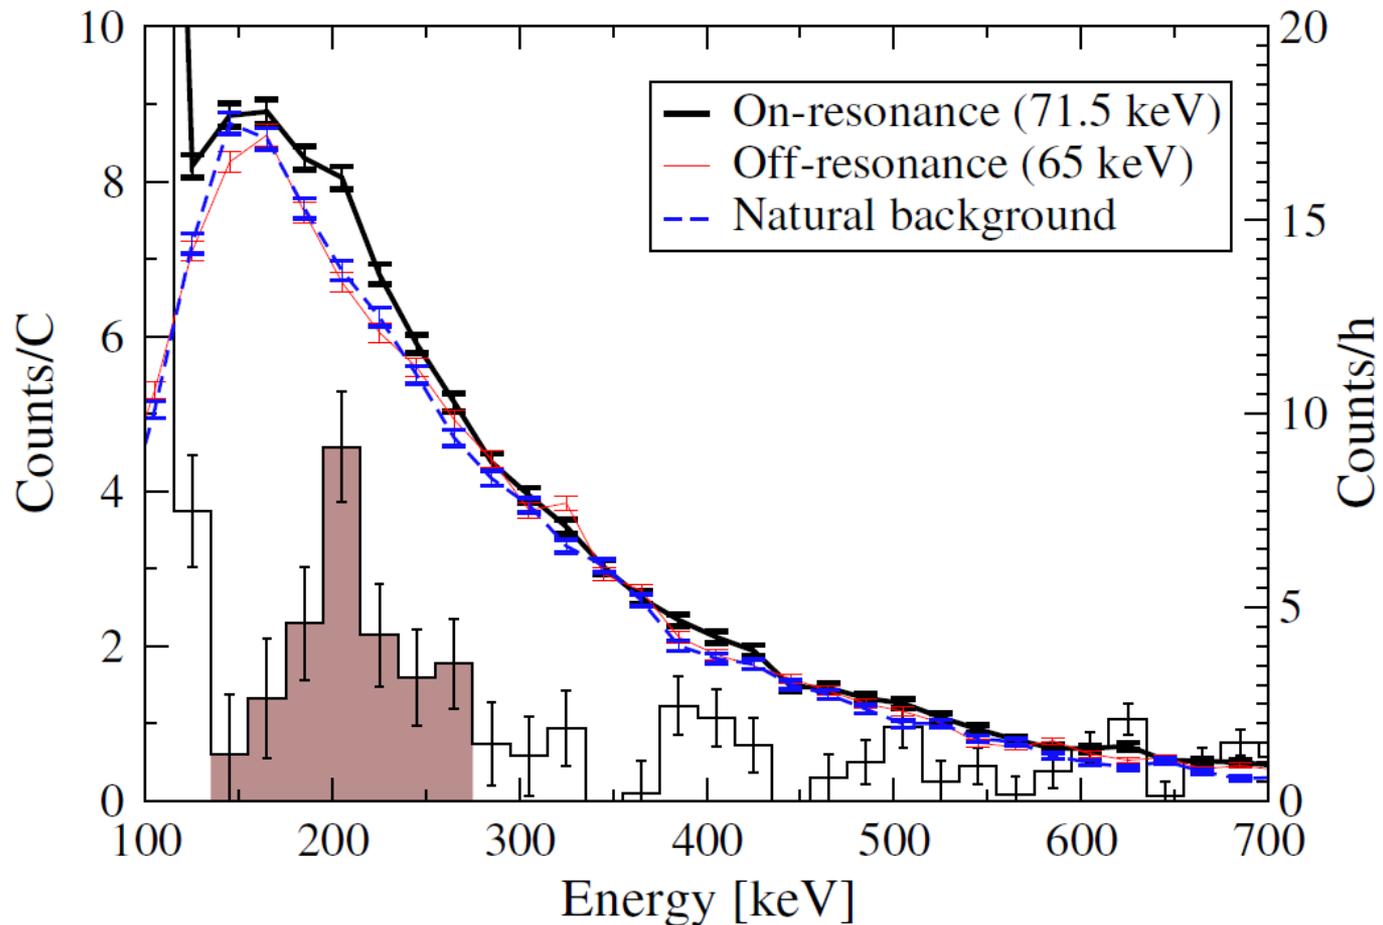

# RAW SPECTRA

- On-resonance and natural background in agreement
- Natural background is the main source of background
- Large reduction compared with overground

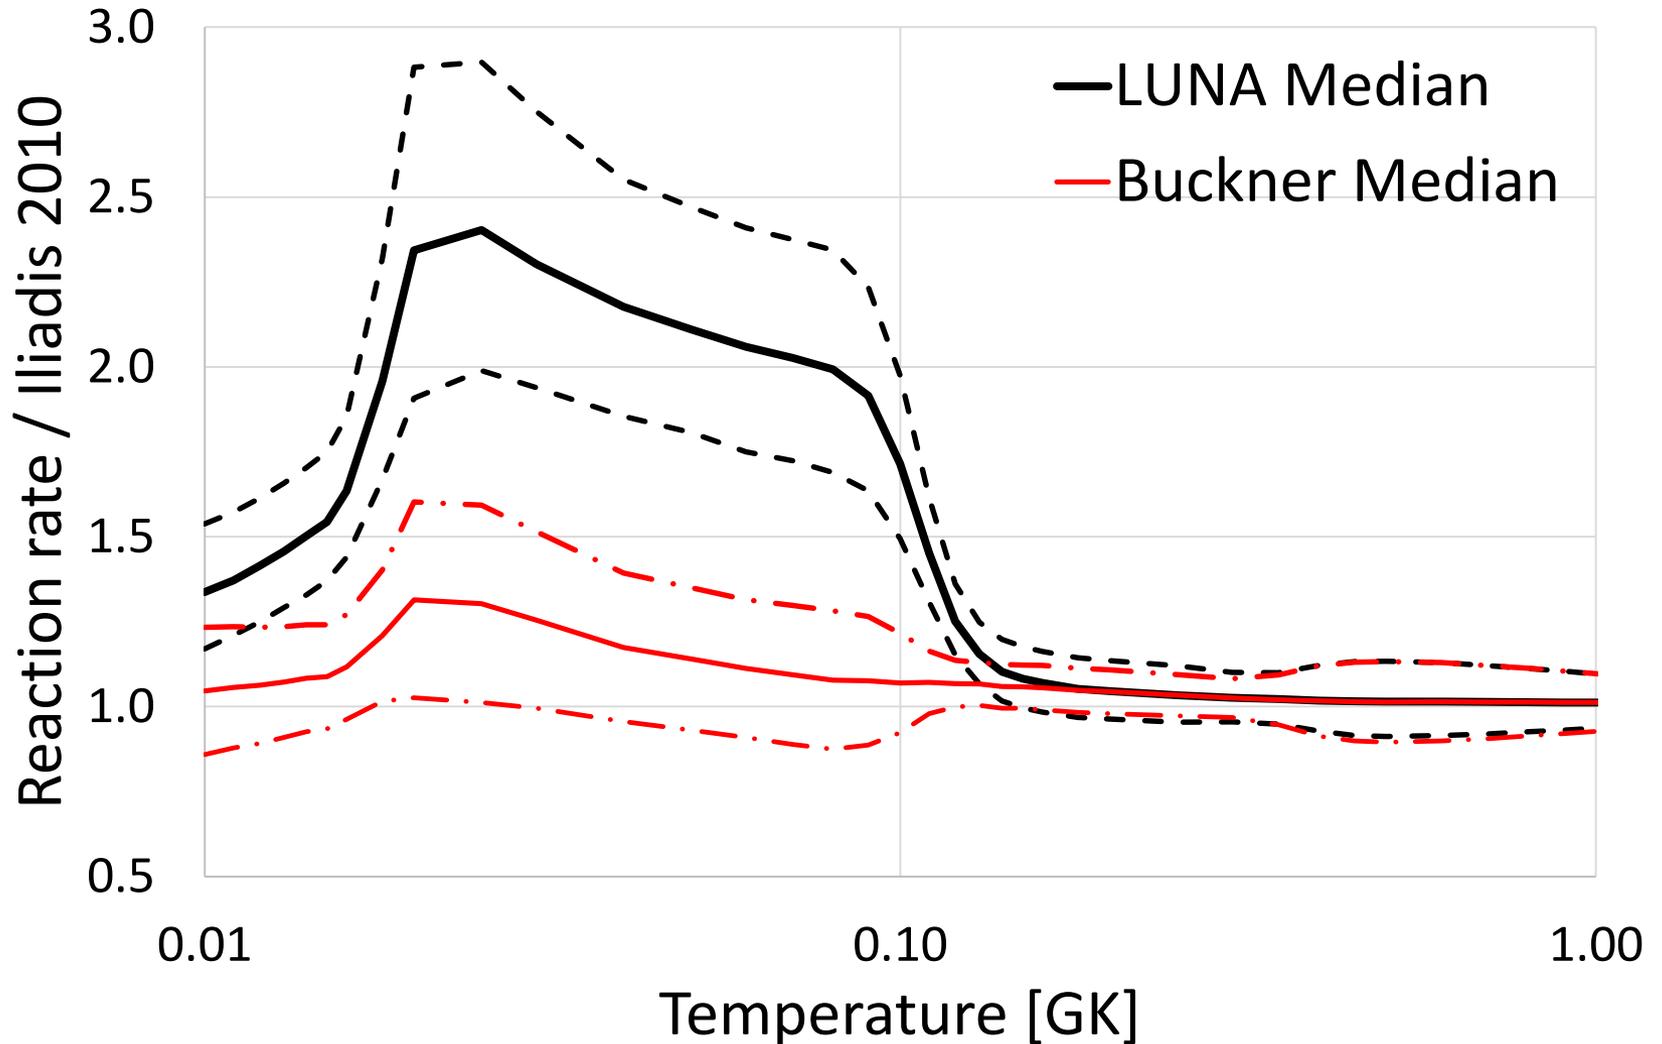

# SUBTRACTED SPECTRA

- Clear peak in the green region of interest
- Shape looks reasonable
- No obvious structures in the off-resonance
- Maximum Likelihood employed to extract counts

# REACTION RATE

- Compared with Iliadis 2010 compilation and Buckner 2015
- Same input file, changed only 70 keV resonance

REACTION RATE

**Improved Direct Measurement of the 64.5 keV Resonance Strength  
in the  $^{17}\text{O}(p,\alpha)^{14}\text{N}$  Reaction at LUNA**

(LUNA Collaboration)

# ASTROPHYSICAL IMPLICATIONS

- Oxygen-rich Group II pre-solar grains
- Tentative origin: low-mass AGB stars and CBP mixing
- CBP is introduced ad-hoc.

# ASTROPHYSICAL IMPLICATIONS

- Oxygen-rich Group II pre-solar grains
- New production site: massive AGBs
- Excellent agreement with Hot Bottom Burning models
- No need for ad-hoc Cool Bottom Process
- First evidence of pre-solar grains from massive AGBs!

# Origin of meteoritic stardust unveiled by a revised proton-capture rate of $^{17}\text{O}$

A green fiber optic cable is connected to a complex metal flange assembly. The flange is made of polished metal and has many small bolts around its perimeter. The background shows a laboratory or industrial setting with various equipment, including a rack of electronic modules and a keyboard. The text "THANK YOU FOR YOUR ATTENTION!" is overlaid in white, bold, sans-serif font.

**THANK YOU FOR YOUR  
ATTENTION!**

# DETECTORS AND $Ta_2O_5$ TARGET

- 8 silicon detectors (Canberra PIPS)
- Surface: 9 cm<sup>2</sup>
- Thickness: 5x300  $\mu\text{m}$ , 3x700  $\mu\text{m}$
- Dead layer:  $\sim$ 20-50nm
- Resolution: 40 keV for the Am peak ( 5486 keV )

- 5 (or 15) keV thick for 200 keV protons
- Stable under beam bombardment ( up to 20C )
- H<sub>2</sub><sup>17</sup>O water at  $\sim$ 95% enrichment
- H<sub>2</sub><sup>18</sup>O water at  $\sim$ 95% enrichment

# $E_p = 193$ KEV RESONANCE

- Clear peak in the green region of interest determined from 193 keV resonance
