# Esperimento FOOT

## FOOT Fragmentation Of Target

Motivation. Measurement of nuclear fragmentation for:

- ✓ Particle Therapy
- ✓ Radioprotection in space

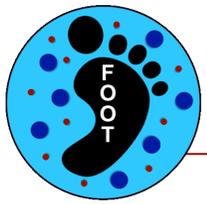

Bologna, Frascati, Milano, Napoli, Perugia, (Pavia), Pisa, Roma1, Roma2, Torino, Trento

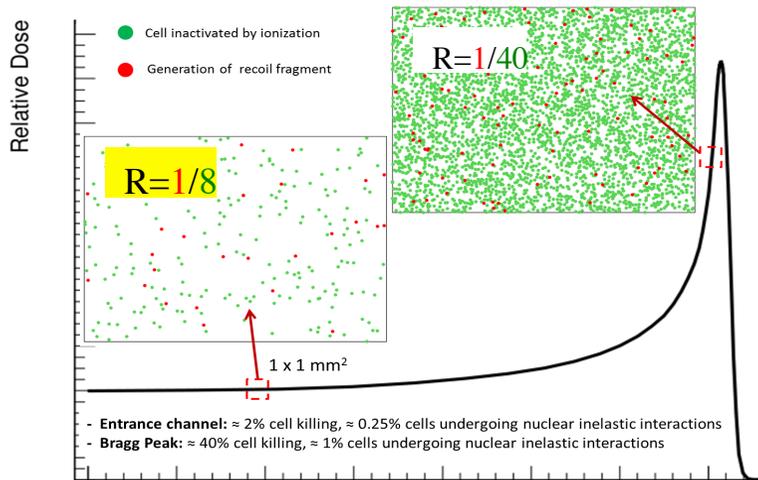

Strasbourg, GSI, Aachen, Nagoya

People: ~70 researchers, ~27 FTE

Data taking 2018-2021@ GSI, Heidelberg, CNAO(?)

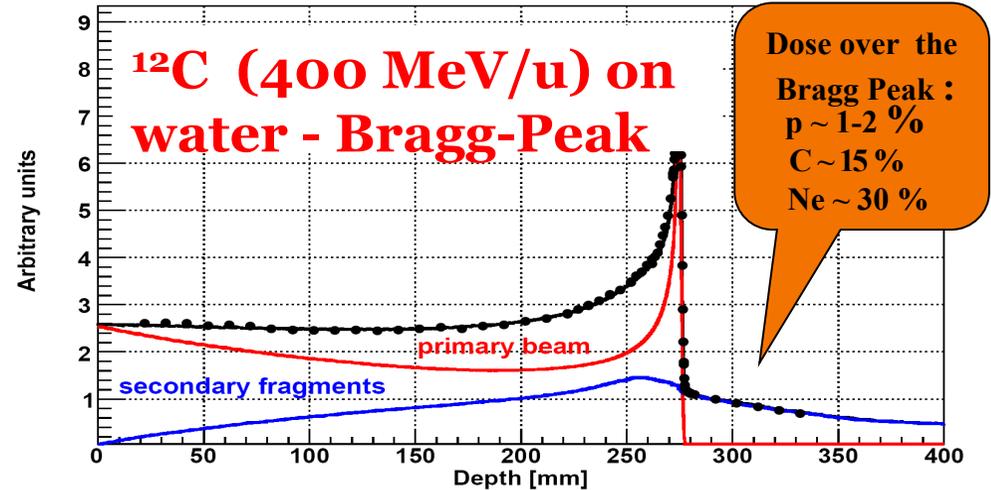

# Esperimento FOOT

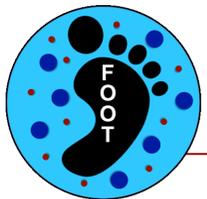

Target fragmentation in proton therapy: Depth gives contribution also outside the tumor region!

# Experimental Program

FRAGMENTATION OF  $^{12}\text{C}$  &  $^{16}\text{O}$  in bio tissue

1. Projectile fragmentation in particle therapy with  $^{12}\text{C}$ ,  $^{16}\text{O}$  and  $^4\text{He}$  beams @ 300-350 MeV/nucl on C,  $\text{C}_2\text{H}_4$  target. **Direct kinematic**
2. Target fragmentation in proton therapy: fragmentation of  $^{12}\text{C}$ ,  $^{16}\text{O}$  beam @ 150-200 MeV/nucl on C,  $\text{C}_2\text{H}_4$  and PMMA target. **Inverse kinematic approach**
3. Fragmentation study for radioprotection in space, in particular on spacecraft shield. He, C, O, (Si?) beams @ 400-800 MeV/u on different target (shield) materials, in particular on  $\text{C}_2\text{H}_4$  (maybe up to 1GeV/nucl? MC studies ongoing)
4. Measurement for PT monitoring:  $\beta^+$  emitters production ( $^8\text{B}$  production) from C,O on C @200-400 MeV/u; large angle fragment emission in C-C, C-O interaction @300MeV/nucl

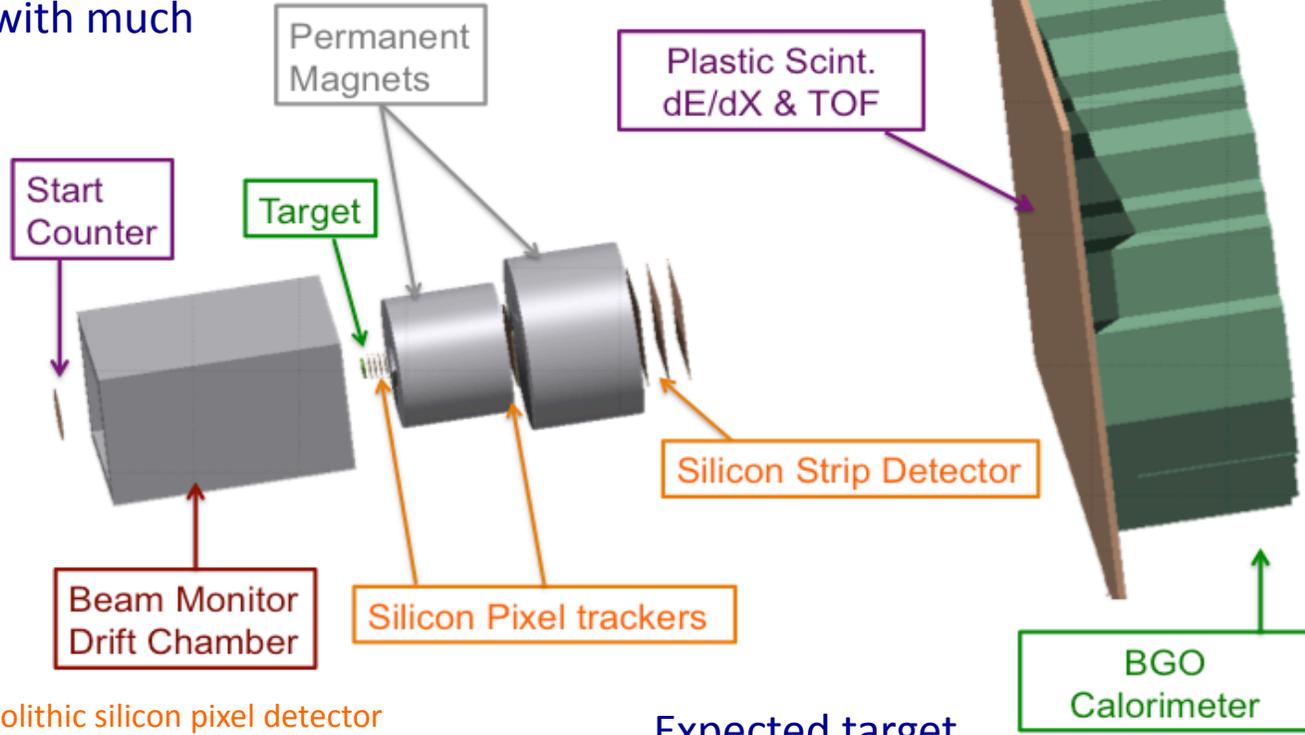

# Esperimento FOOT

# Detector

Heavy frag forward peaked and  $E_{kin} \sim 200 \text{ MeV/nuc}$   
Light fragment spread out in energy with much larger angle distribution

For the fragment with  $Z > 2$   
measurements of **TOF**, **P**,  **$E_{kin}$** ,  **$\Delta E$**

Maximum 2 meters length

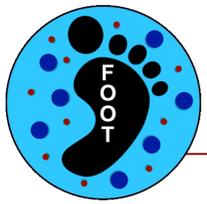

- ✓ Start Counter = thin plastic scintillator (RM1)
- ✓ Beam Monitor = drift chamber (LNF, MI)
- ✓ Vertex detector & Intermediate Tracker = monolithic silicon pixel detector (LNF)
- ✓ Large tracker = silicon strip detector (RM1, LNF, PG)
- ✓ DE/TOF Detector = plastic scintillator (PI)
- ✓ Calorimeter = BGO crystal calorimeter (TO)

Expected target fragmentation performances:

- $\sigma_p/p \sim 4-5\%$
- $\sigma_{TOF} \sim 100 \text{ ps}$
- $\sigma_{E_{kin}}/E_{kin} \sim 1-2\%$
- $\sigma_{DE} \sim 2\%$

Possible Beam time @ CNAO, HIT, GSI  
Calibration @ Trento, LNF

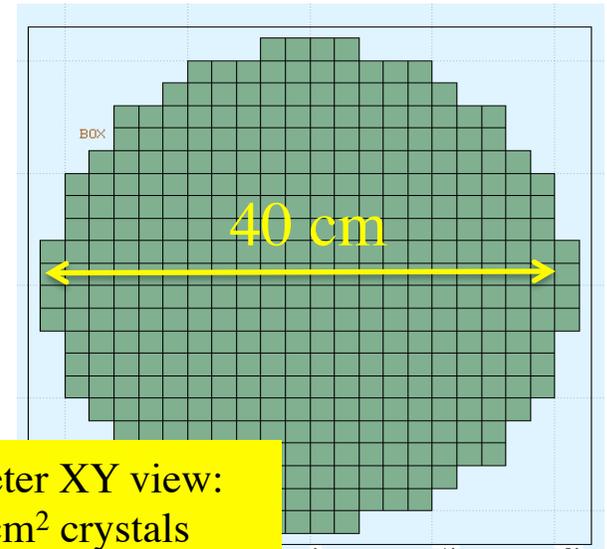

ToV is involved **in the simulation** and design optimization of the BGO Calorimeter

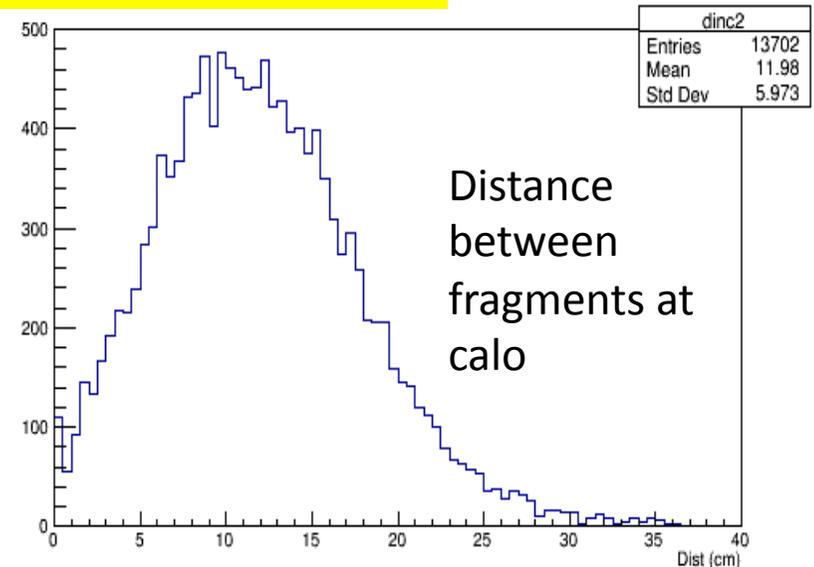

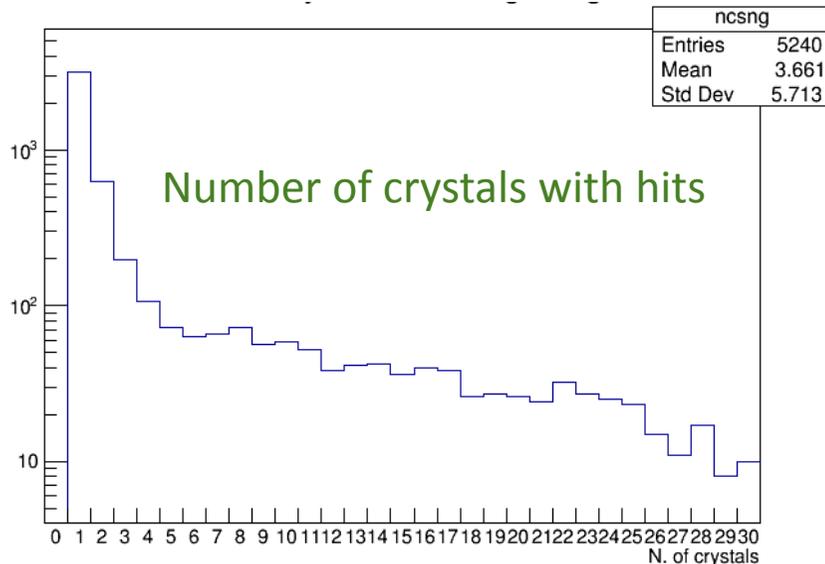

Crystals will be recovered from the L3 experiment

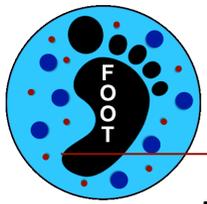

The cluster size is very limited and the distance between multiple fragments seems large->clustering seems an easy task ( also due to BGO density)

Neutron leakage is an issue

Calorimeter XY view:  
360 2x2cm<sup>2</sup> crystals

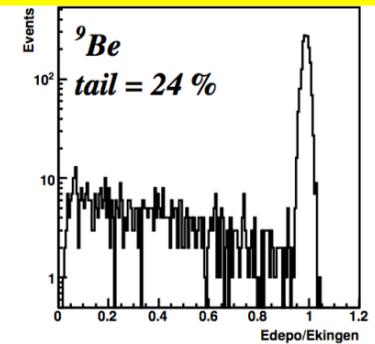

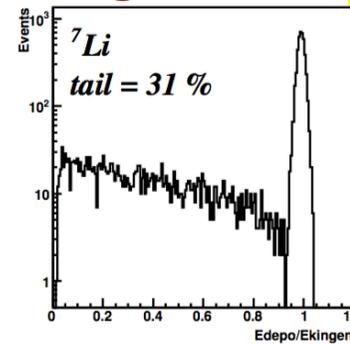

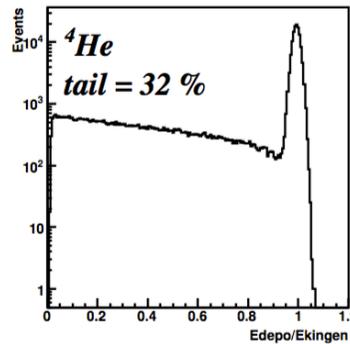

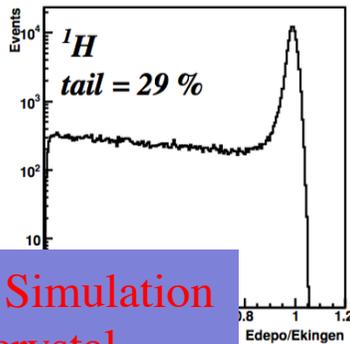

The neutron leakage in BGO seems to be more and more important for energy higher than 200 MeV/nucl and for light fragments (!)

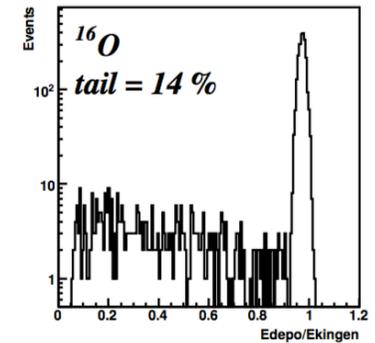

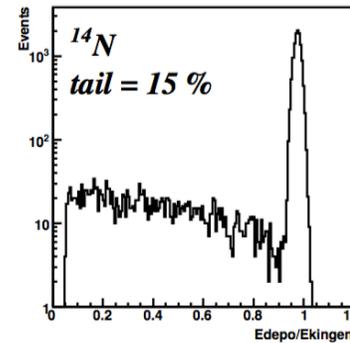

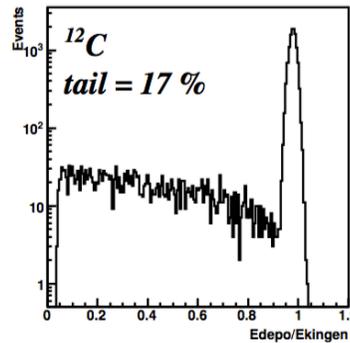

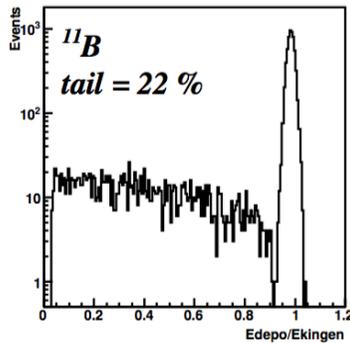

Even if the fit constrained can tag such events, these must be minimized to keep the systematic under control.

## BGO calo length VS neutron leakage

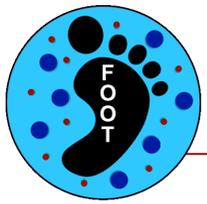

200 MeV/nucl

FLUKA 2017 Simulation  
14 cm length crystal

Ecalo/Ekin

- ✓ E' stato redatto il CDR per l'approvazione dell'esperimento
- ✓ L'intero esperimento FOOT è stimato costare circa 1.4M Euro fino al 2021.

Richieste finanziarie Roma TV:  
Missioni 3.5 kEuro

### Introduction

The FOOT (FragmentatiOn Of Target) experiment aims to perform this investigation using an inverse kinematic strategy. This means that instead of using a beam of protons as a projectile, a beam of heavy tissue-like ions (O and C) with the same energy per nucleon would be used against a proton target. This approach is necessary since products emerging from target fragmentation have very low energy and it would be extremely difficult to measure, while using inverse kinematics secondary fragments have boosted energy and longer range, making detection easier.

The final goal of the detector is to measure the heavy fragment (Z=3) cross section with maximum uncertainty of 5% and the fragment energy spectrum with an energy resolution of the order of 1-2 MeV/u.

**A<sup>-</sup> rating + 100 PAC days beam time**

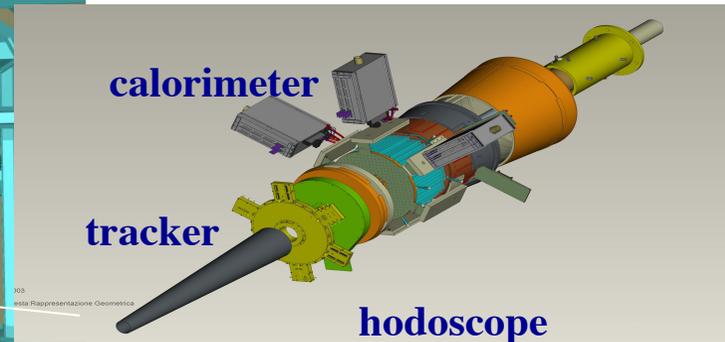

### Hybrid states have same $J^P$ values as $qqq$ baryons. How to identify them?

- Overpopulation of  $N$   $1/2^+$  and  $N$   $3/2^+$  states compared to QM projections.
- $A_{1/2}$  ( $A_{3/2}$ ) and  $S_{1/2}$  show different  $Q^2$  evolution. Can we do it?

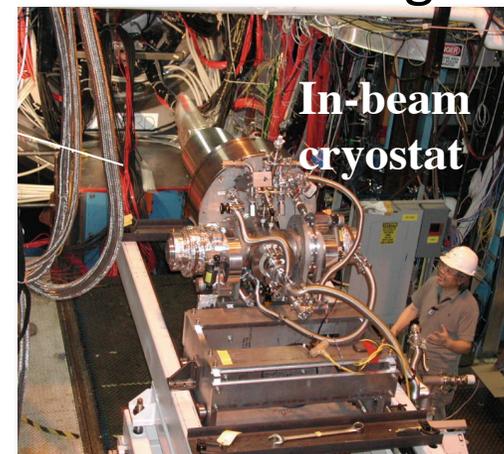

Study of  $Q^2$  evolution of resonances electro-couplings from  $K^+\Lambda$  electro production from the proton

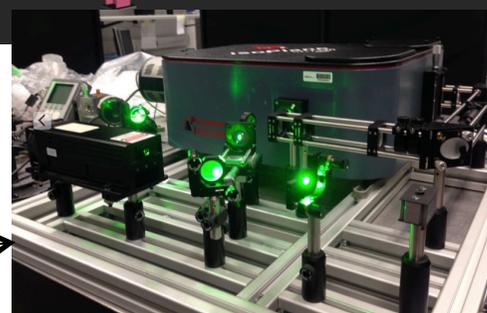

$\theta = 2.5^\circ \rightarrow 4.5^\circ$   
 Forwar Tagger

Polarized target

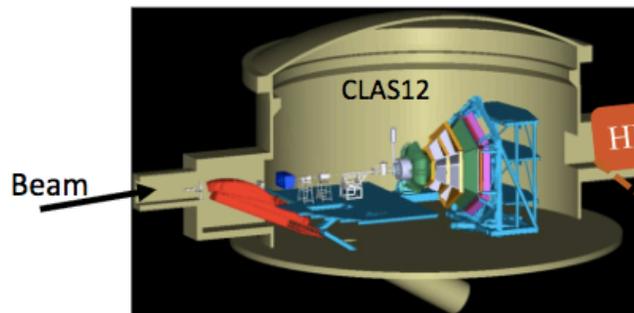

Portable Raman

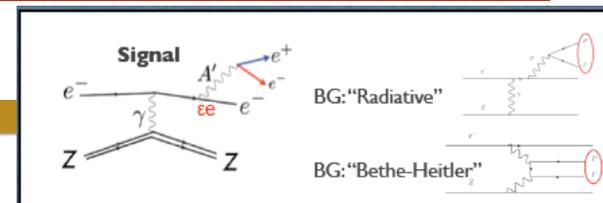

Hall B

- Searches for  $A'$  with **prompt** and **displaced** vertices
- Downstream Hall B alcove
- 2015 Engineering Run, 1 GeV beam at 50 nA
- 2016 Physics Run, 2.3 GeV beam at 200 nA
- Future running planned for 2018 and beyond

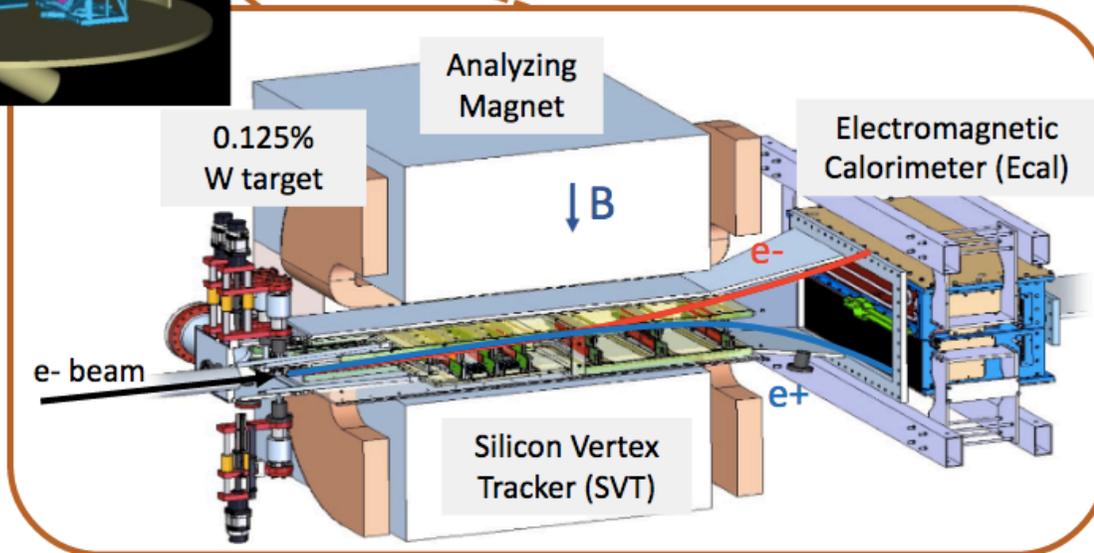

Silicon Vertex Tracker:

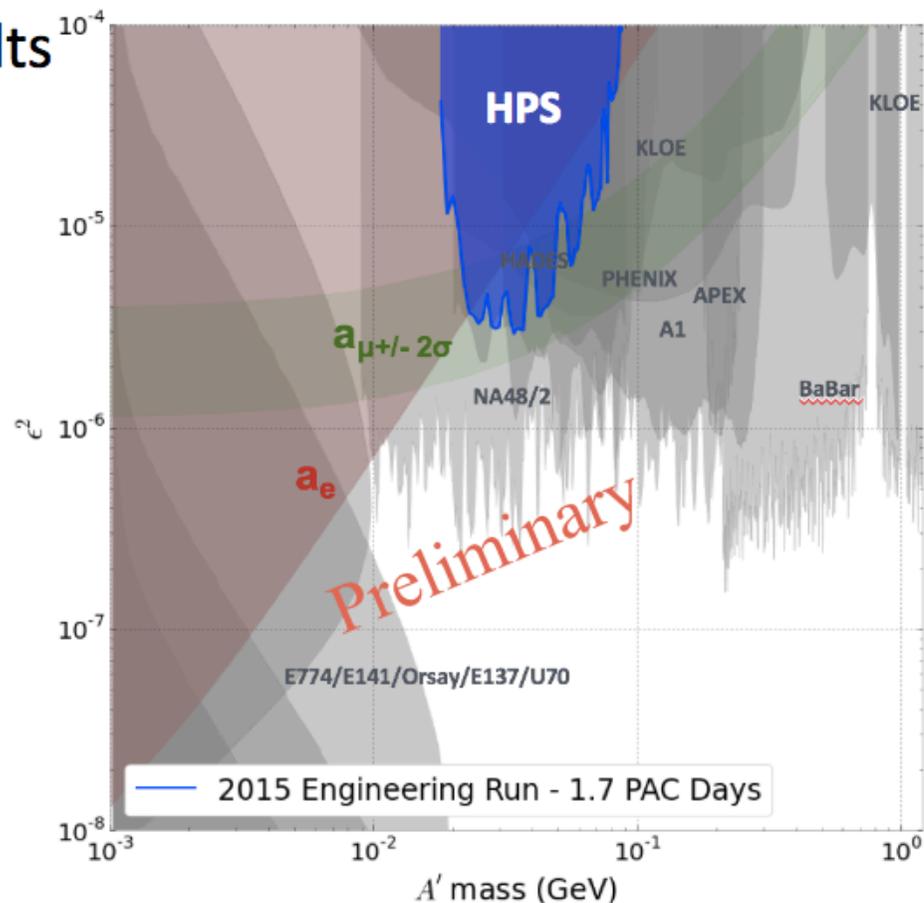

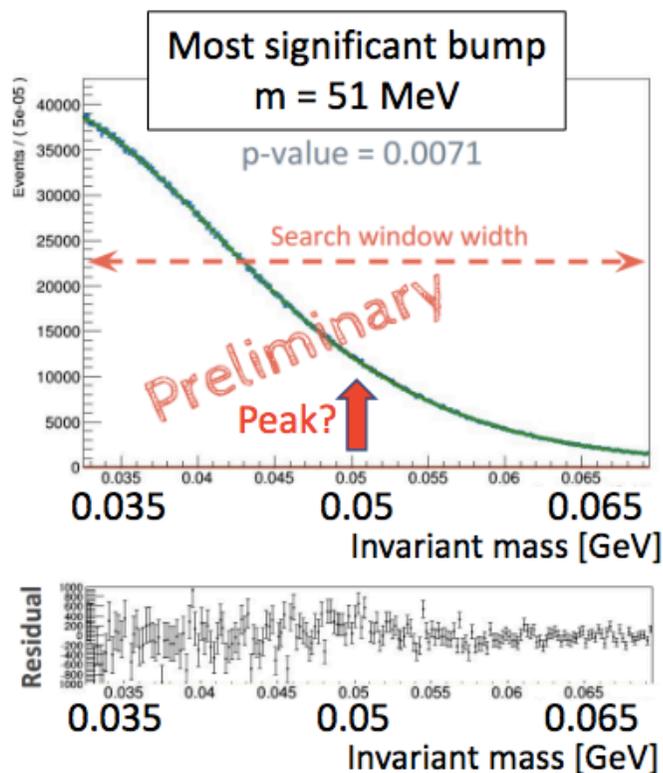

- Tracks particles
- Momentum and vertex reconstruction

EM Calorimeter:

- Triggers events
- Energy and timing

## 2015 Engineering Run results

No vertexing reach attained → needed to run much longer!

- Projected reach did not fully account for acceptance and efficiency

# Attività previste

---

## HD-ice -> HD-e

- Test delle prestazioni eHD con fasci di elettroni ( al JLAB)
- Distillazione del gas di HD ed analisi on-line del gas distillato con il nuovo sistema Raman (Roma - PP1)

## CLAS12 Partecipazione a run di commissioning e presa dati:

- per Run Group A (12 GeV) Hybrid Meson
- Run Group K (6,6 GeV e 8,8 GeV) Hybrid Baryons

## Le richieste maggiori sono relative al progetto PolTarg:

- manutenzione ed al funzionamento del sistema Raman
- installazione e commissioning del sistema di distillazione del gas di HD a Roma

In particolare nel 2018 prevediamo di acquisire 12 nuove bombole per il contenimento del gas distillato con raccorderia e valvola ad ottima tenuta ed il controller di temperatura con sensori calibrati.

<b>Missioni</b>	
Turni di Misura CLAS12, Test Test e-HD, missioni Ge per collaborazione FT e analisi	35 K€
<b>Consumo</b>	
Ottica di ricambio sistema Raman e raccorderia da vuoto	6 K€
<b>Altro Consumo</b>	
Liquidi criogenici: LHe + LN	8 K€
<b>Trasporti</b>	
Spese di Trasporto e sdoganamento gas HD	2 K€
<b>Manutenzione</b>	
Manutenzione Laser e set-up Laser	2 K€
<b>Apparati</b>	
12 nuove bombole di Al elettropulito con valvole a tenuta e carrelli, nuova raccorderia con Swagelock per 14 bombole esistenti e controller di temperatura Lake Shore con 4 sensori Cernox calibrati a 4 k	37 K€
<b>Totale Richieste</b>	<b>90 K€</b>

# Backup

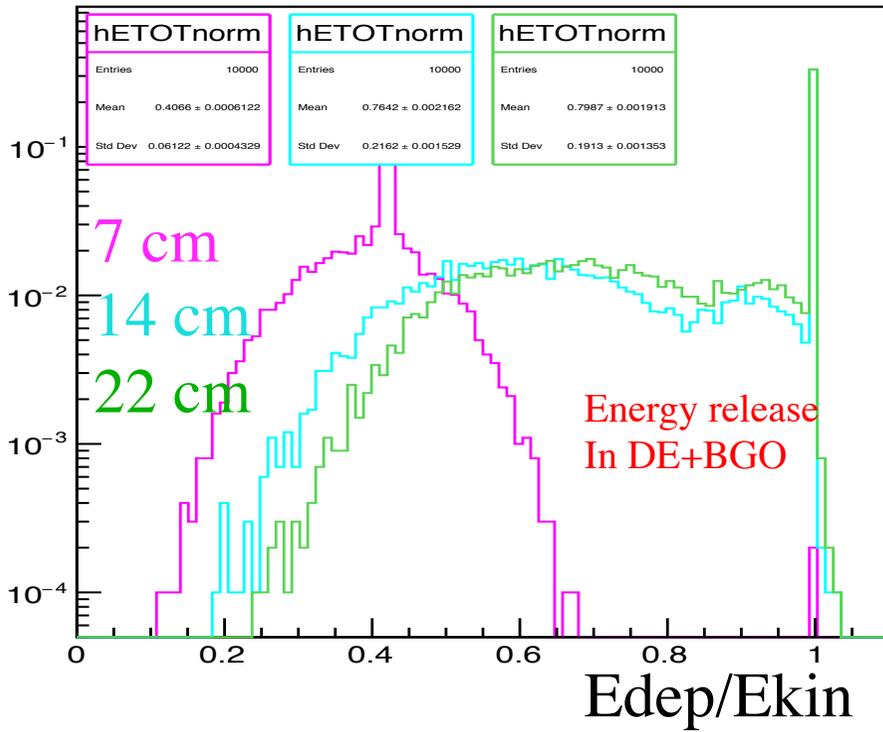

# BGO calo length VS neutron leakage

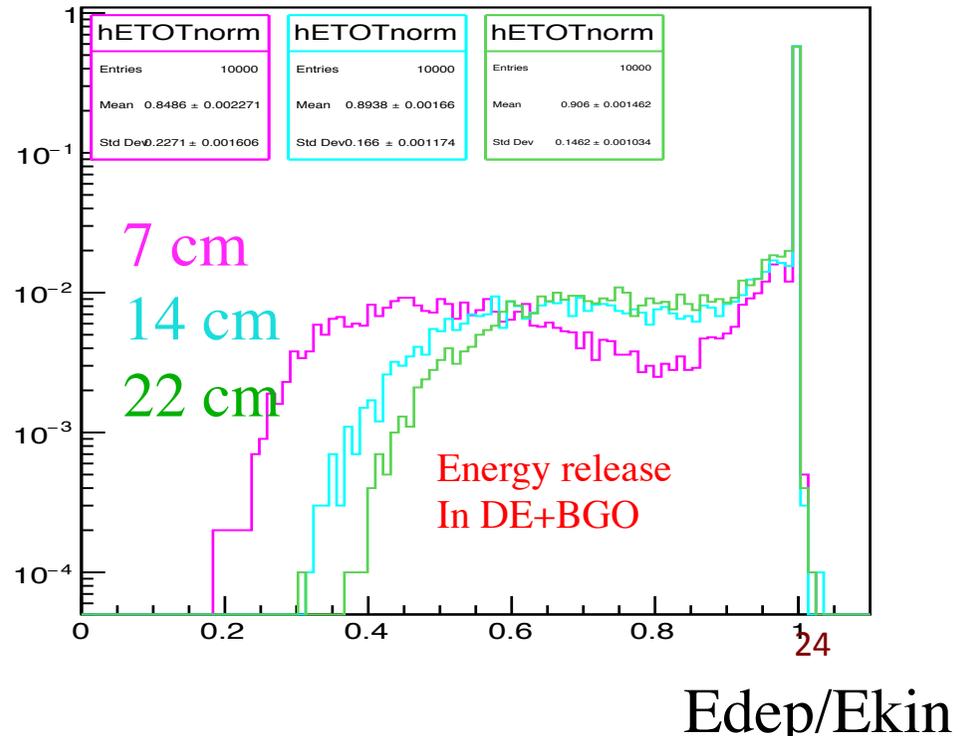

The neutron leakage is difficult to eliminate. The crystal length must be  $> 10$  cm to contain Li, Be fragments at 350 MeV/u. With 7 cm crystals at 300 MeV/nucl also the Li frag escapes

Li @350 MeV /nucl  $E_{kin}=2450$  MeV

C @ 350 MeV /nucl  $E_{kin} = 4.200$  MeV

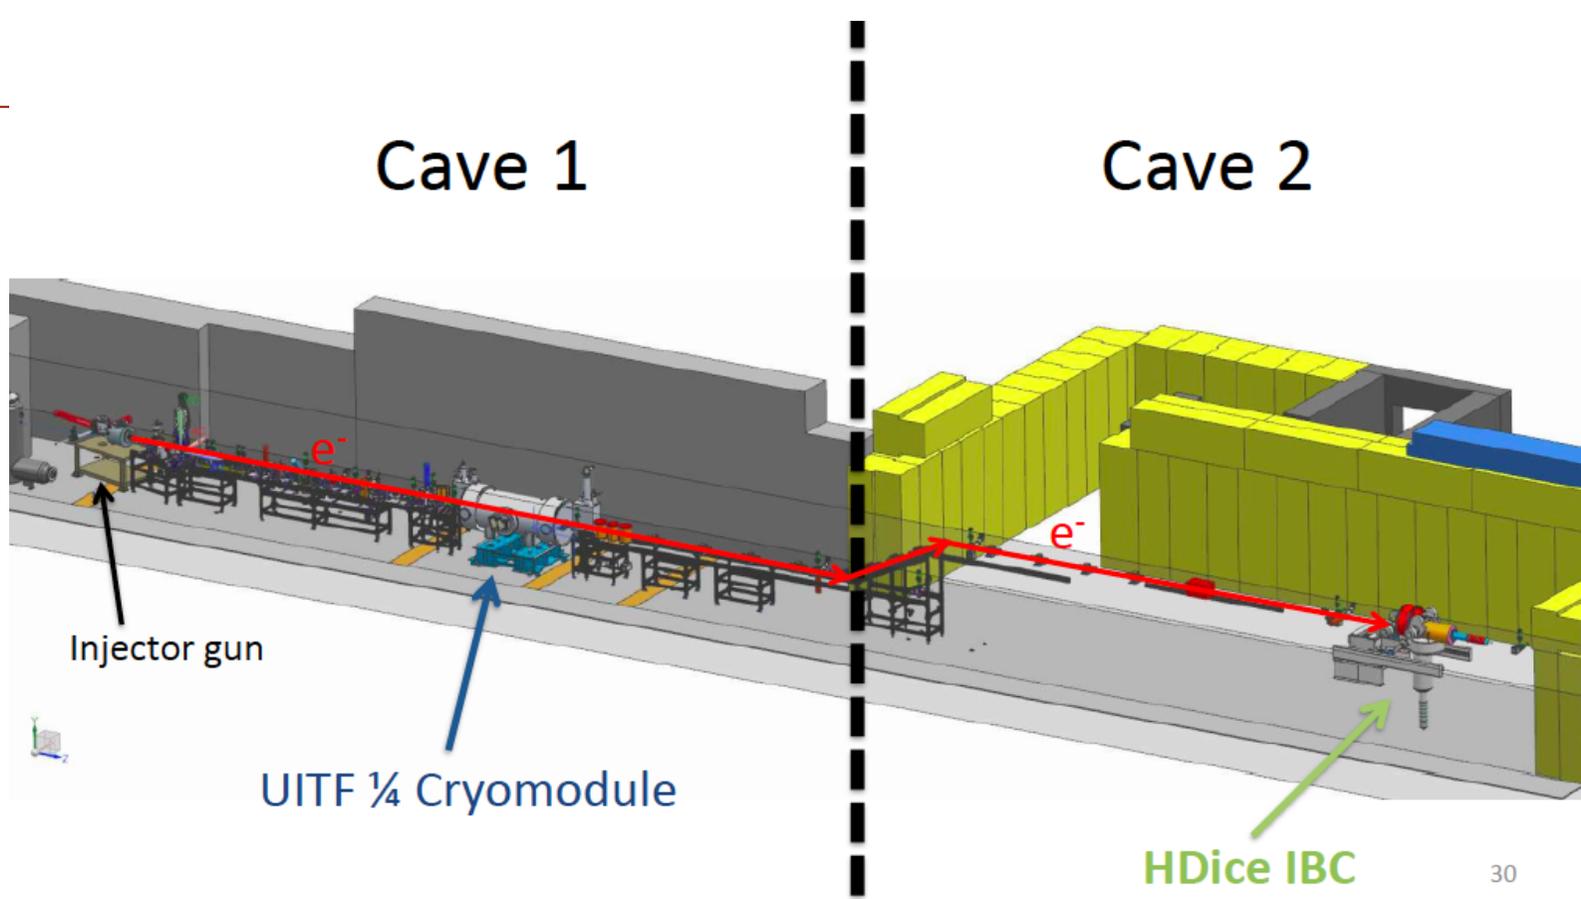

# ORIZZONTE TEMPORALE

## **BGO-OD (Bonn)**

- Finanziamento SFB (programma pluriennale per più università) 2008-2016 (terminato in giugno dell'anno scorso)
- Chiesto nuovo finanziamento DFG (programma pluriennale per singole università) per altri 4 anni (si attende risposta)
- Funzionamento di ELSA è garantito per gli esperimenti di fisica adronica (BGO-OD e CB-ELSA) almeno fino al 2020
- In CSN3 la sigla era in scadenza a Dicembre 2016 ed è stata rinnovata per altri 4 ann

## **A2 (Mainz)**

- Approvata la proroga del finanziamento SFB fino al 2023

**Il 1/4 cryomodule è pronto per il test a RF.**

**IBC pronto per i test.**

- ✓ Installazione del supporto dell'IBC nella zona del test beam
- ✓ Inizio polarizzazione di nuovi bersagli da utilizzare per il test.
