## Upsilon production vs charged particles multiplicity

The ratios of the production cross sections of the Upsilon(nS) mesons are studied using a sample of pp collisions at  $\sqrt{s}=7$  TeV, corresponding to an integrated luminosity of  $4.8 \text{ fb}^{-1}$ , collected with the CMS detector at LHC. The ratios are measured for Upsilon(nS) as a function of the number of charged tracks. Evidence of a decrease of the ratios between the higher and the lower mass states as a function of the particles' multiplicity is observed.

### Collaboration name

CMS

**Primary author:** CMS, Collaboration

**Presenter:** CMS, Collaboration

**Session Classification:** Poster session

**Track Classification:** Flavor and Precision Physics
