Neutrino masses generated through new physics at the TeV scale

Tuesday, 4 June 2019 17:39 (23 minutes)

The small neutrino masses might be a consequence of the well known seesaw mechanism, which requires new fields as heavy as 10^{14} GeV. However, there are alternative explanations. For example neutrino masses might be generated through loops or via high-dimensional operators. In both cases, the mediating particles can have TeV-scale masses, and if so it might be possible to produced them at the LHC.

Collaboration name

Primary author: FONSECA, Renato (IPNP)

Presenter: FONSECA, Renato (IPNP)

Session Classification: Neutrino

Track Classification: Neutrino Physics
