

Decoding Leptonic and Semileptonic B Decays

Tuesday, 8 May 2018 11:15 (1 hour)

We present a new strategy to explore New Physics contributions to leptonic and semileptonic B decays. With this method we can give constraints to the Wilson coefficients of the usual model-independent low-energy effective Hamiltonian; general considerations on selected models are presented, too. We devote particular attention to the effect of possible CP-violating phases in the short-distance coefficients, and assess the impact of New Physics for the determination of the CKM matrix element $|V_{ub}|$. This strategy can also be implemented for B_c decays.

Teaser (will appear on the printed program)

We present a new strategy to explore New Physics contributions to leptonic and semileptonic B decays, focusing our attention to possible new CP-violating phases
