<b>Gluonium content in <math>\eta'</math></b>	<b>final, paper in writing</b>
$\eta \rightarrow \pi^+\pi^-\gamma$	<b>in progress</b>
$\eta \rightarrow e^+e^- e^+e^-$	<b>in progress</b>
$\eta \rightarrow \mu^+ \mu^-$	<b>new</b>
$\gamma\gamma \rightarrow \pi^0\pi^0$	<b>in progress</b>
$\gamma\gamma \rightarrow \eta$	<b>new</b>

# $\eta'$ gluonium content

A global fit to determine the pseudoscalar mixing angle and the gluonium content of the  $\eta'$  meson.

Paper under the review of the collaboration

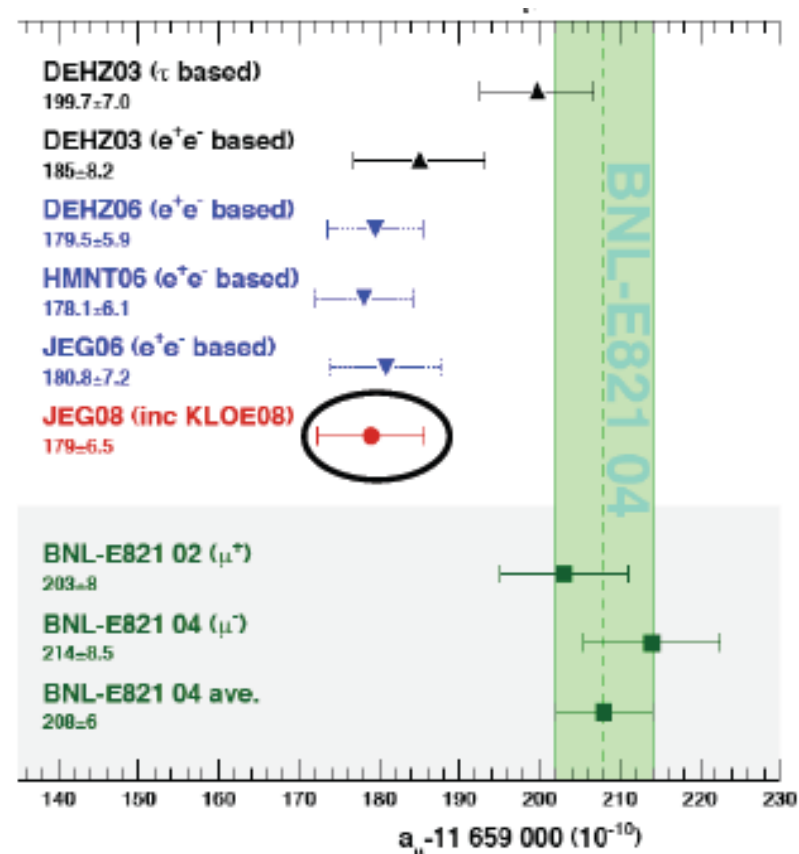

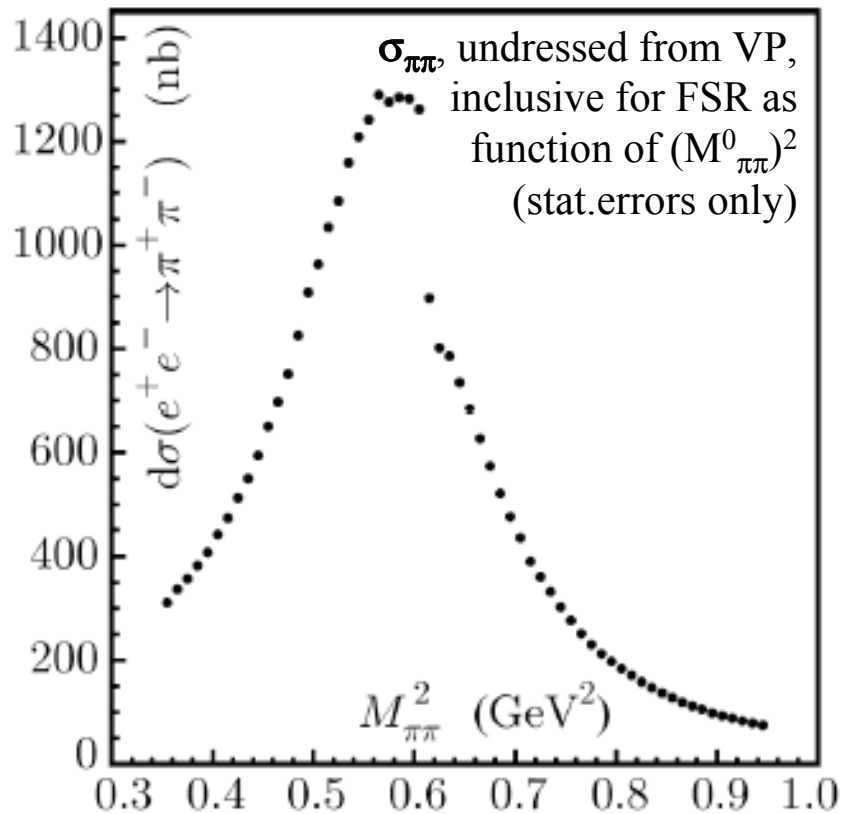

- Use KLOE  $R_\phi = \text{BR}(\phi \rightarrow \eta' \gamma) / \text{BR}(\phi \rightarrow \eta \gamma)$
- From a global fit to all measured  $V \rightarrow P \gamma$  and  $P \rightarrow V \gamma$  transitions, we extract:
  - gluonium fraction  $Z_G^2 = 0.12(4)$
  - pseudoscalar mixing angle  $\phi_P = 40.4(6)^\circ$
  - $\phi$ - $\omega$  mixing angle  $\phi_V = 3.32(9)^\circ$
- Fit result slightly different from our previous but **confirms** the presence of significant gluonium contribution in  $\eta'$ .

# KLOE result [PLB670(2009)285]

$$a_{\mu}^{\pi\pi}(0.35-0.95\text{GeV}^2) = (387.2 \pm 0.5_{\text{stat}} \pm 2.4_{\text{sys}} \pm 2.3_{\text{theo}}) \cdot 10^{-10}$$

Systematic frac. errors:  
exp. 0.6%, th. 0.6%

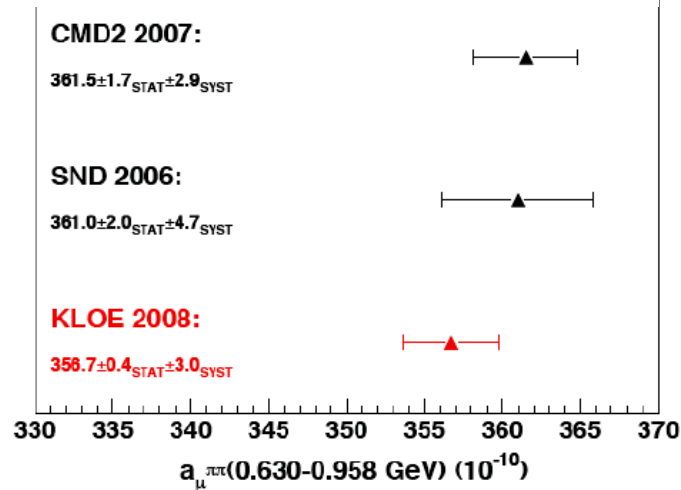

- Th. predictions on  $a_{\mu}^{\pi\pi}$  vs BNL result.
- KLOE strengthens the discrepancy between SM and experiment ( $\sim 3.3\sigma$ )

# Comparison with CMD2/SND

only  
statistical  
errors are  
shown

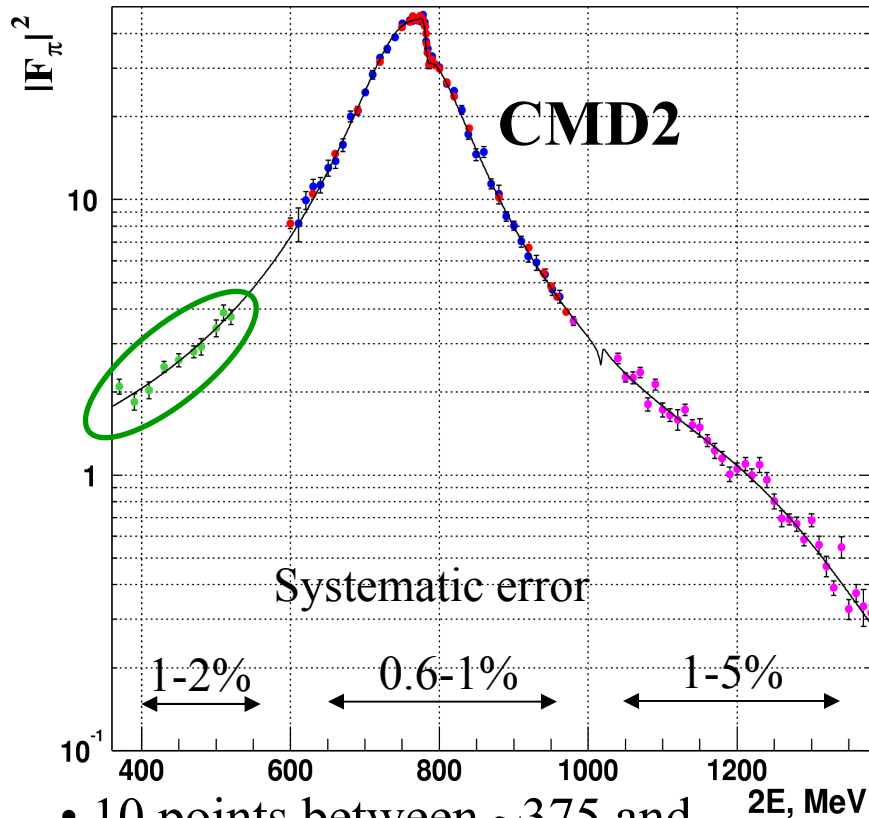

band: KLOE error  
data points: CMD2/SND experiments  
(CMD-2 and SND data have been averaged  
over width of KLOE bin (0.01 GeV<sup>2</sup>))

# $\sigma(e^+e^- \rightarrow \pi^+\pi^-)$ at threshold

KLOE small angle analysis did not cover the region below 0.35 GeV<sup>2</sup>  
 $(\Delta a_{\mu}^{\pi\pi}(s < 0.35 \text{ GeV}^2) \sim 15\% \text{ of } a_{\mu}^{\text{had}})$

- 10 points between  $\sim 375$  and  $525$  MeV  $\rightarrow$   **$\sim 15$  MeV steps**

$$\sigma_{\pi^+\pi^-\pi^0} = 329.8 \text{ nb}, \quad \sigma_{\pi^+\pi^-\gamma} = 4.4 \text{ nb}$$

Off peak data  
 (lower  $\phi$  bkg  
 at 1 GeV)

$$\sigma_{\pi^+\pi^-\pi^0} = 6 \text{ nb}, \quad \sqrt{s} = 1003.71 \text{ MeV}$$

(from SND, PRD66 (2002) 032001)

# New analysis in progress

## 2 pion tracks at large angles

$$50^\circ < \theta_\pi < 130^\circ$$

## Photons at large angles

$$50^\circ < \theta_\gamma < 130^\circ$$

- independent complementary analysis
- threshold region  $(2m_\pi)^2$  accessible
- $\gamma_{\text{ISR}}$  photon detected (4-momentum constraints)
- lower background from  $\phi$  decays  
( $\phi \rightarrow f_0 \gamma \rightarrow \pi\pi \gamma$ ,  $\phi \rightarrow \pi^+ \pi^- \pi^0$ ) off-peak

Use data sample taken at  $\sqrt{s} \cong 1000 \text{ MeV}$ ,  
20 MeV below the  $\phi$ -peak

## *New analysis in progress*

- Selection cuts established
- Efficiencies evaluated
- **Few systematic uncertainties still under evaluation**
- Very good agreement between the spectrum of the preliminary new result and the KLOE 08 published analysis

**Analysis very close to final result**

# *Kaon physics: state of the art*

---

$K_S \rightarrow e^+e^-$	published
$BR(K^\pm \rightarrow e^\pm \nu)/BR(K^\pm \rightarrow \mu^\pm \nu)$	final, paper in writing
CPT test from interferometry	1 fb <sup>-1</sup> update, paper in writing
$K_L$ lifetime with 2004/5 data	in progress
$K_S$ lifetime	in progress
$BR(K^\pm \rightarrow \pi^\pm \pi^+ \pi^-)$	in progress

# *NP potential of $R_K = \Gamma(K^\pm_{e2})/\Gamma(K^\pm_{\mu2})$*

- SM prediction with 0.04% precision, benefits of cancellation of hadronic uncertainties (no  $f_K$ ):  $R_K = 2.477(1) \times 10^{-5}$  [Cirigliano Rosell arXiv:0707:4464].
  - Helicity suppression can boost NP [Masiero-Paradisi-Petronzio PRD74(2006)011701].
- In R-parity MSSM, LFV can give **O(1%) deviation from SM**.

$$R_K^{LFV} \simeq R_K^{SM} \left[ 1 + \left( \frac{m_K^4}{M_H^4} \right) \left( \frac{m_\tau^2}{m_e^2} \right) |\Delta_R^{31}|^2 \tan^6 \beta \right]$$

NP dominated by contribution of  $e\nu_\tau$  final state, with effective coupling (from loop):

$$lH^\pm \nu_\tau \rightarrow \frac{g_2}{\sqrt{2}} \frac{m_\tau}{M_W} \Delta_{13}$$

- Present exp. accuracy on  $R_K$  at 6% level.
- New measurements of  $R_K$  can be very interesting, **if error at 1% level or better**.

## *Entering the precision realm for $R_K$*

Main actors (experiments) in the challenge to push down precision on  $R_K$ :

**NA48/2**: preliminary result with 2003 data:  $R_K = 2.416(43)_{\text{stat}}(24)_{\text{syst}} 10^{-5}$ ,  
from ~4000 Ke2 candidates (2% accuracy)

**NA48/2**: preliminary result with 2004 data:  $R_K = 2.455(45)_{\text{stat}}(41)_{\text{syst}} 10^{-5}$ ,  
from ~4000 Ke2 candidates from special minimum bias run (3% accuracy)

**KLOE**: preliminary result with 2001-2005 data:  $R_K = 2.55(5)_{\text{stat}}(5)_{\text{syst}} 10^{-5}$ ,  
from ~8000 Ke2 candidates (3% accuracy), perspectives to reach 1% error  
after analysis completion.

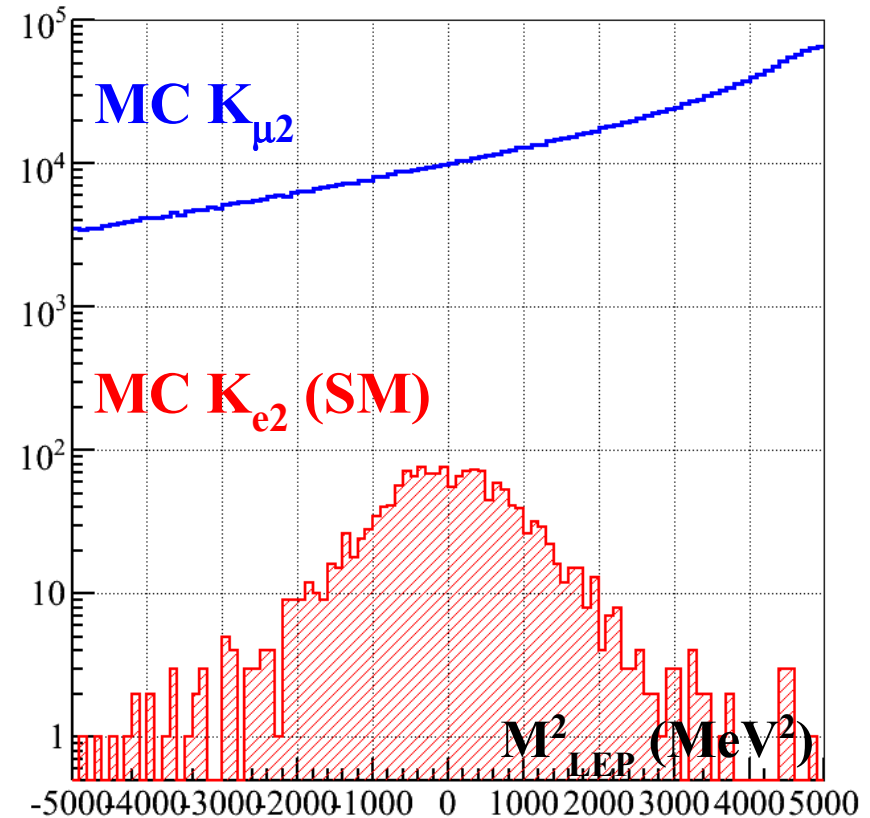

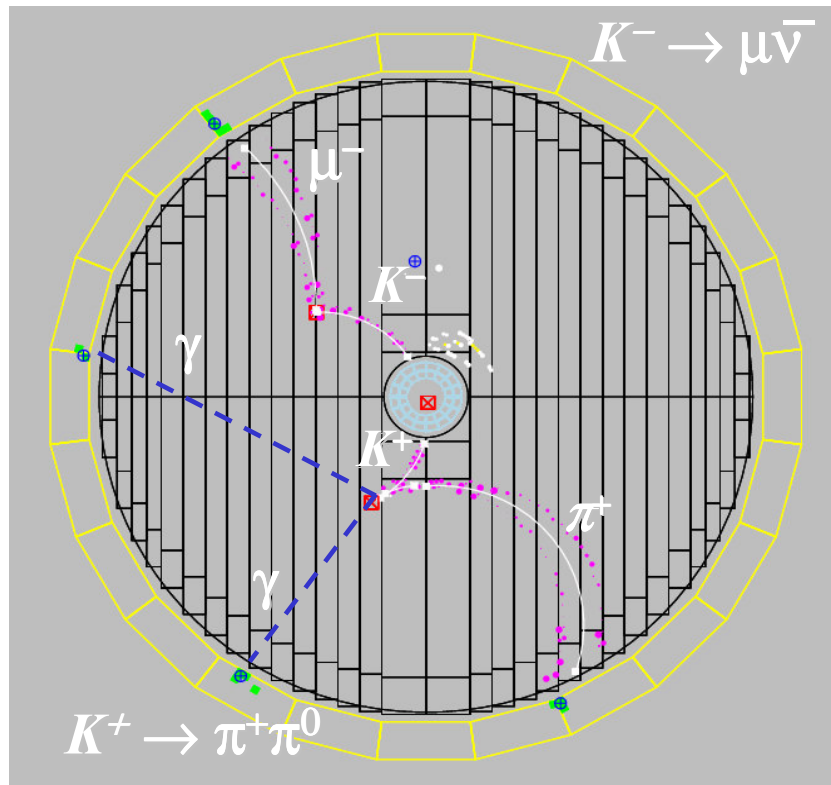

**NA62** (ex NA48): collected ~150,000 Ke2 events in dedicated 2007 run,  
aims to breaking the 1% precision wall, possibly reaching  $< \sim 0.5\%$

# Analysis of $R_K$ : basic principles

In KLOE data set (2001/5) expect  $\sim 4 \times 10^4$  events.

- Perform **direct search** for  $K_{e2}$  and  $K_{\mu 2}$ ; **no tag**: gain  $\times 4$  of statistics.
- Selection of  $K^\pm$  decays asking for kink in DC.
- Exploit tracking of K and secondary: assuming  $m_\nu=0$  get  $M_{LEP}^2$ .

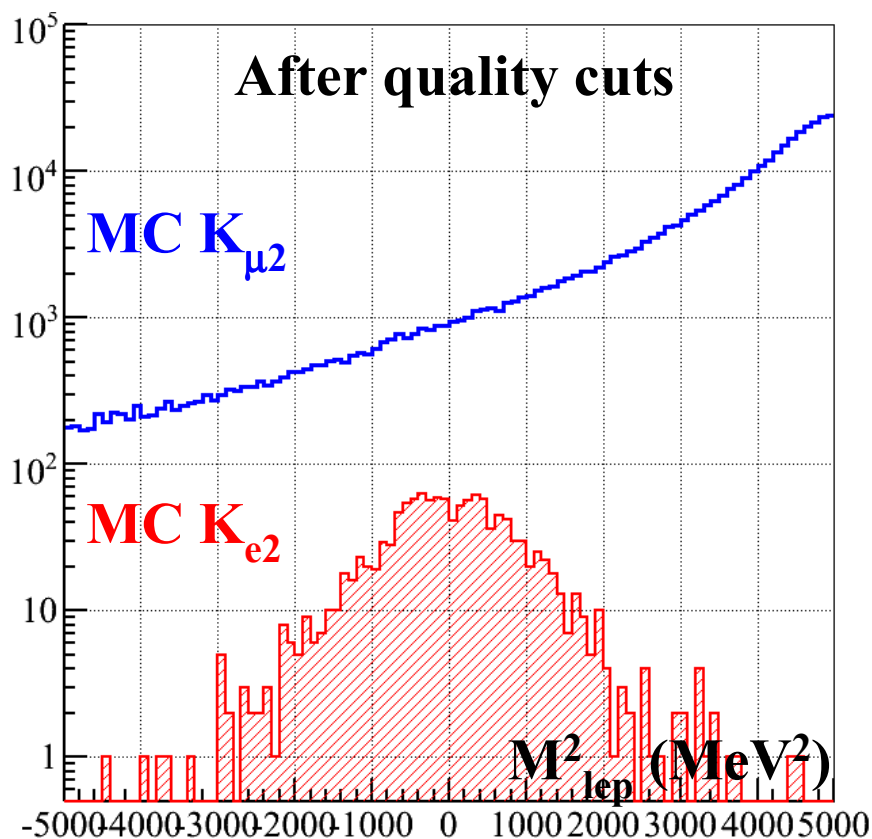

## $R_K$ analysis: quality cuts

- Rule of the game: reject  $K\mu 2$  by  $10^4$ , with  $Ke 2$  efficiency of  $O(50\%)$ .
- Background composition:  $K\mu 2$  events with bad  $P_K$ , bad  $P_1$  reconstruction.
- Apply quality cuts for  $K$  and **exploit  $\Phi \rightarrow KK$  two-body kinematics**

$M_{lep}^2 = f(P_K, P_1, \cos\theta) \rightarrow$  a-priori error  $\delta M_{lep}^2$  is scaled by opening angle.

Achieve cancellation in  $Ke 2/K\mu 2$  efficiencies, applying  $\cos\theta$  trailing cuts

**Efficiency  $\sim 33\%$  at this level**

# $R_K$ analysis: counting $K\mu 2$ events

$M^2_{lep} \text{ (MeV}^2\text{)}$

$M^2_{lep} \text{ (MeV}^2\text{)}$

Fit to  $M^2_{lept}$  distribution: 300 million  $K\mu 2$  events per charge  
Background under the peak  $< 0.1\%$ , from MC

# $R_K$ analysis: electron identification

- Apply quality cuts, enough to count  $K_{\mu 2}$ , not for  $K_{e 2}$  (still Bkg  $\sim 10 \times \text{Sig}$ )
- **Further rejection for  $K_{e 2}$** : extrapolate track to EmC, select closest cluster
- PID exploits EmC granularity: energy deposits  $E_k$  into 5 layers in depth

# $R_K$ analysis: electron identification

Improve bkg rejection, PID refined

Combine 12 variables using NN

- E/P
- Cluster depth
- Asymmetry of energy lost in first two innermost (outermost) planes
- T2p, Aet (curvature of the fit)
- Energy deposit in first 15 cm
- Skewness of cell-depth distribution
- RMS of plane energies ( $E_{RMS}$ )
- Plane releases: E1, Nmax, Emax
- TOF

Parametrize with  $P_{lep}$ , impact angle

Check Data-MC agreement for NN output:  $K_{Le3}$

# $R_K$ analysis: control samples

Check NN output using  $K^{\pm}_{e3}$ ,  $K^{\pm}_{\mu3}$

Require  $\pi^0$  detection

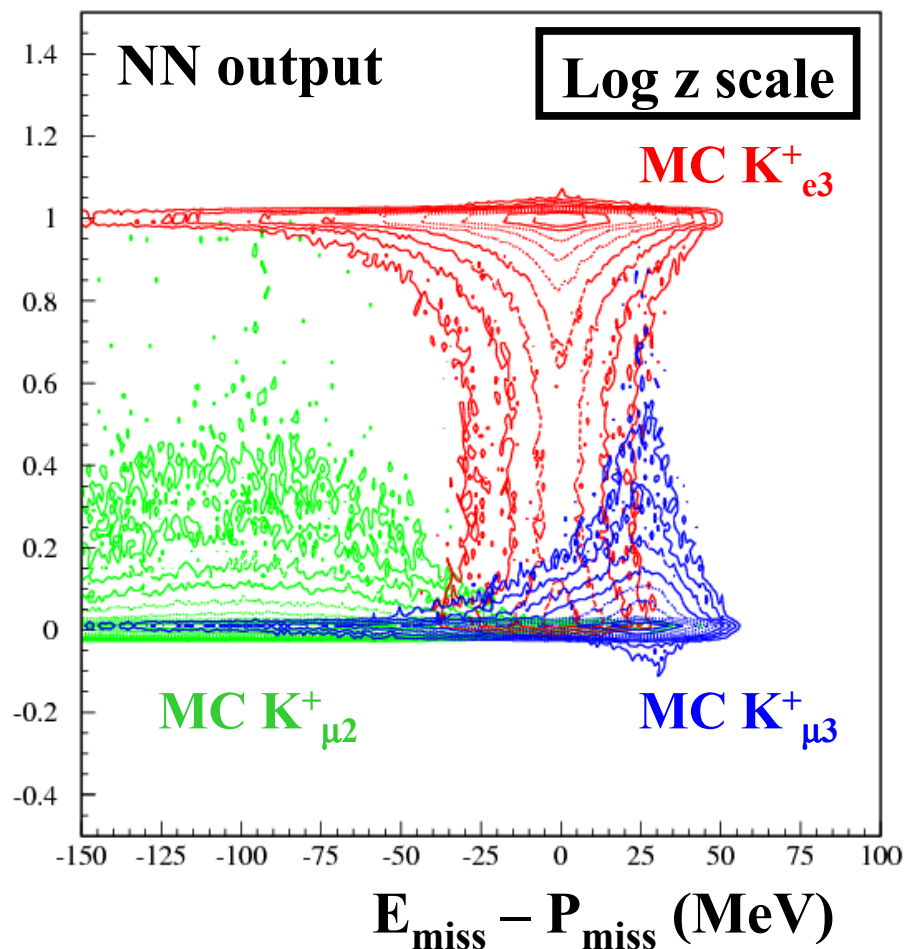

Cut against  $\pi\pi^0$  bkg

Use  $\pi^0 \gamma$ 's to evaluate  $E_{\text{miss}}, P_{\text{miss}}$

Can select pure  $K^{\pm}e3$  sample above 0.2

Can select  $K^{\pm}\mu3$  sample below 0.4

Perform 2d fit in entire plane

# $R_K$ : control samples

Can select pure  $K^{\pm}_{e3}$  sample above 0.2

Can select  $K^{\pm}_{\mu3}$  sample below 0.4

Perform 2d fit in entire plane

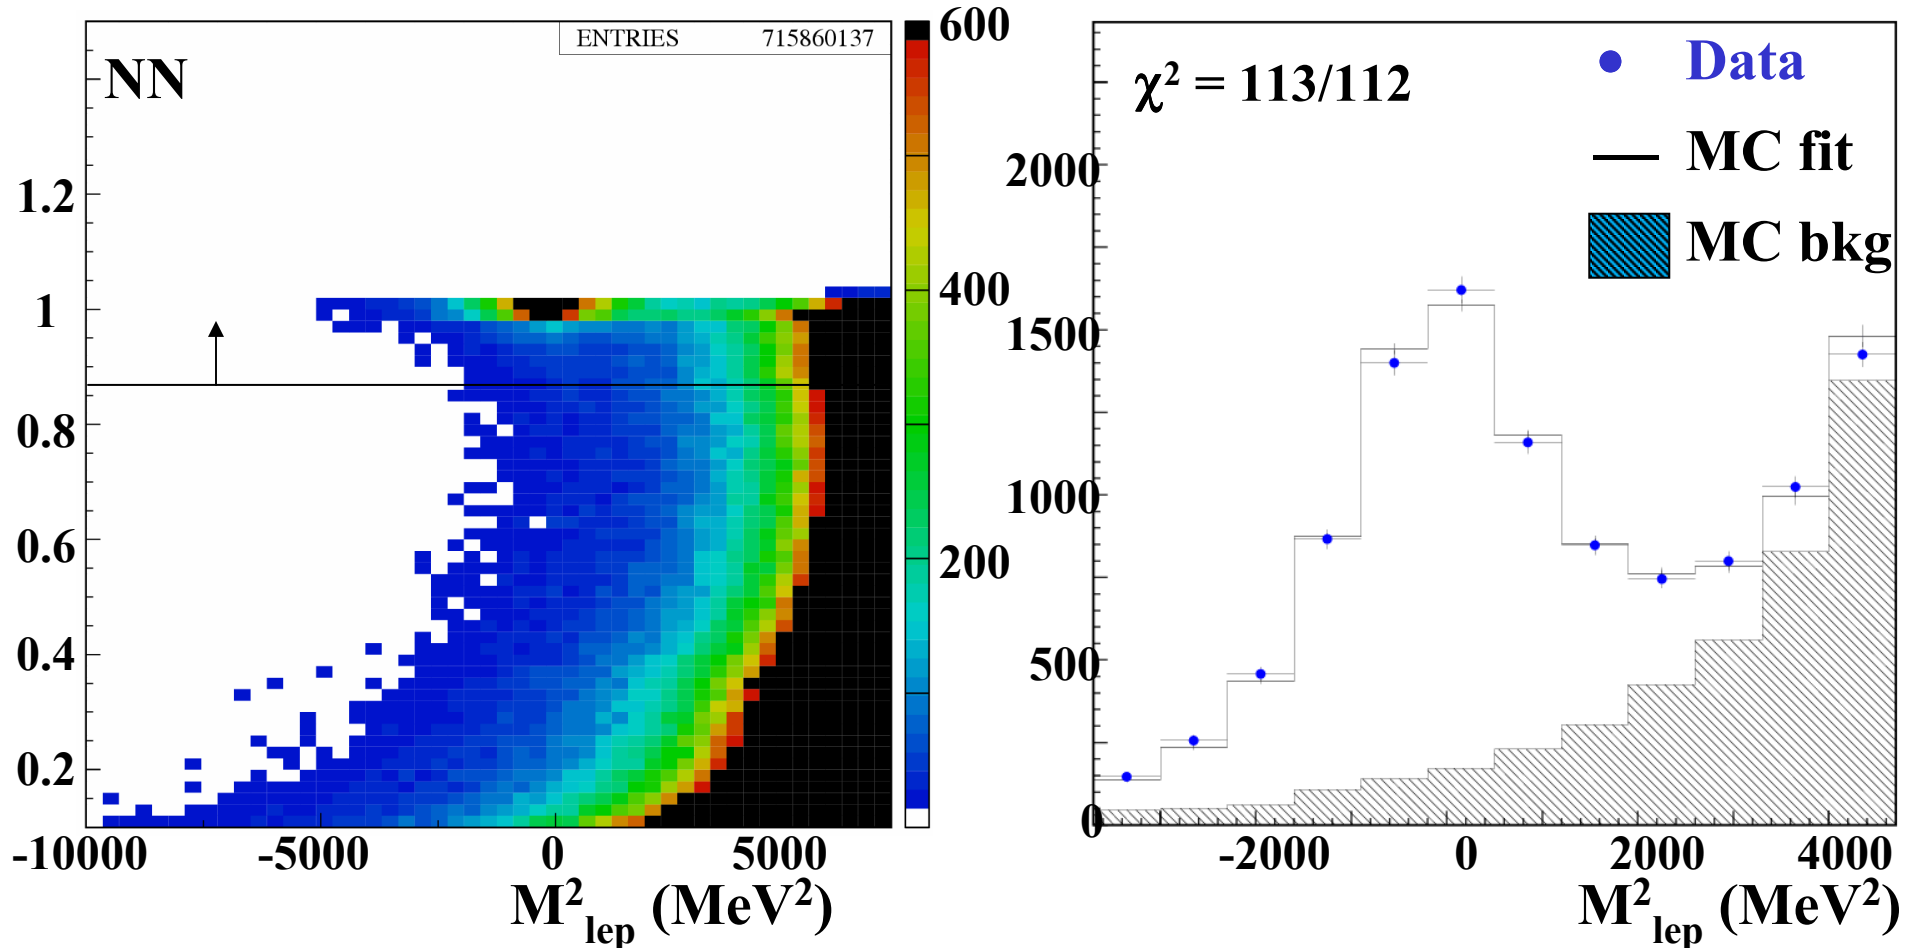

# $R_K$ analysis: fitting for $Ke2$ counting

Two-dimensional binned likelihood fit in the  $NN$ -  $M_{lep}^2$  plane:

$$0.86 < NN < 1.02, -4000 < M_{lep}^2 < 6100 \text{ MeV}^2.$$

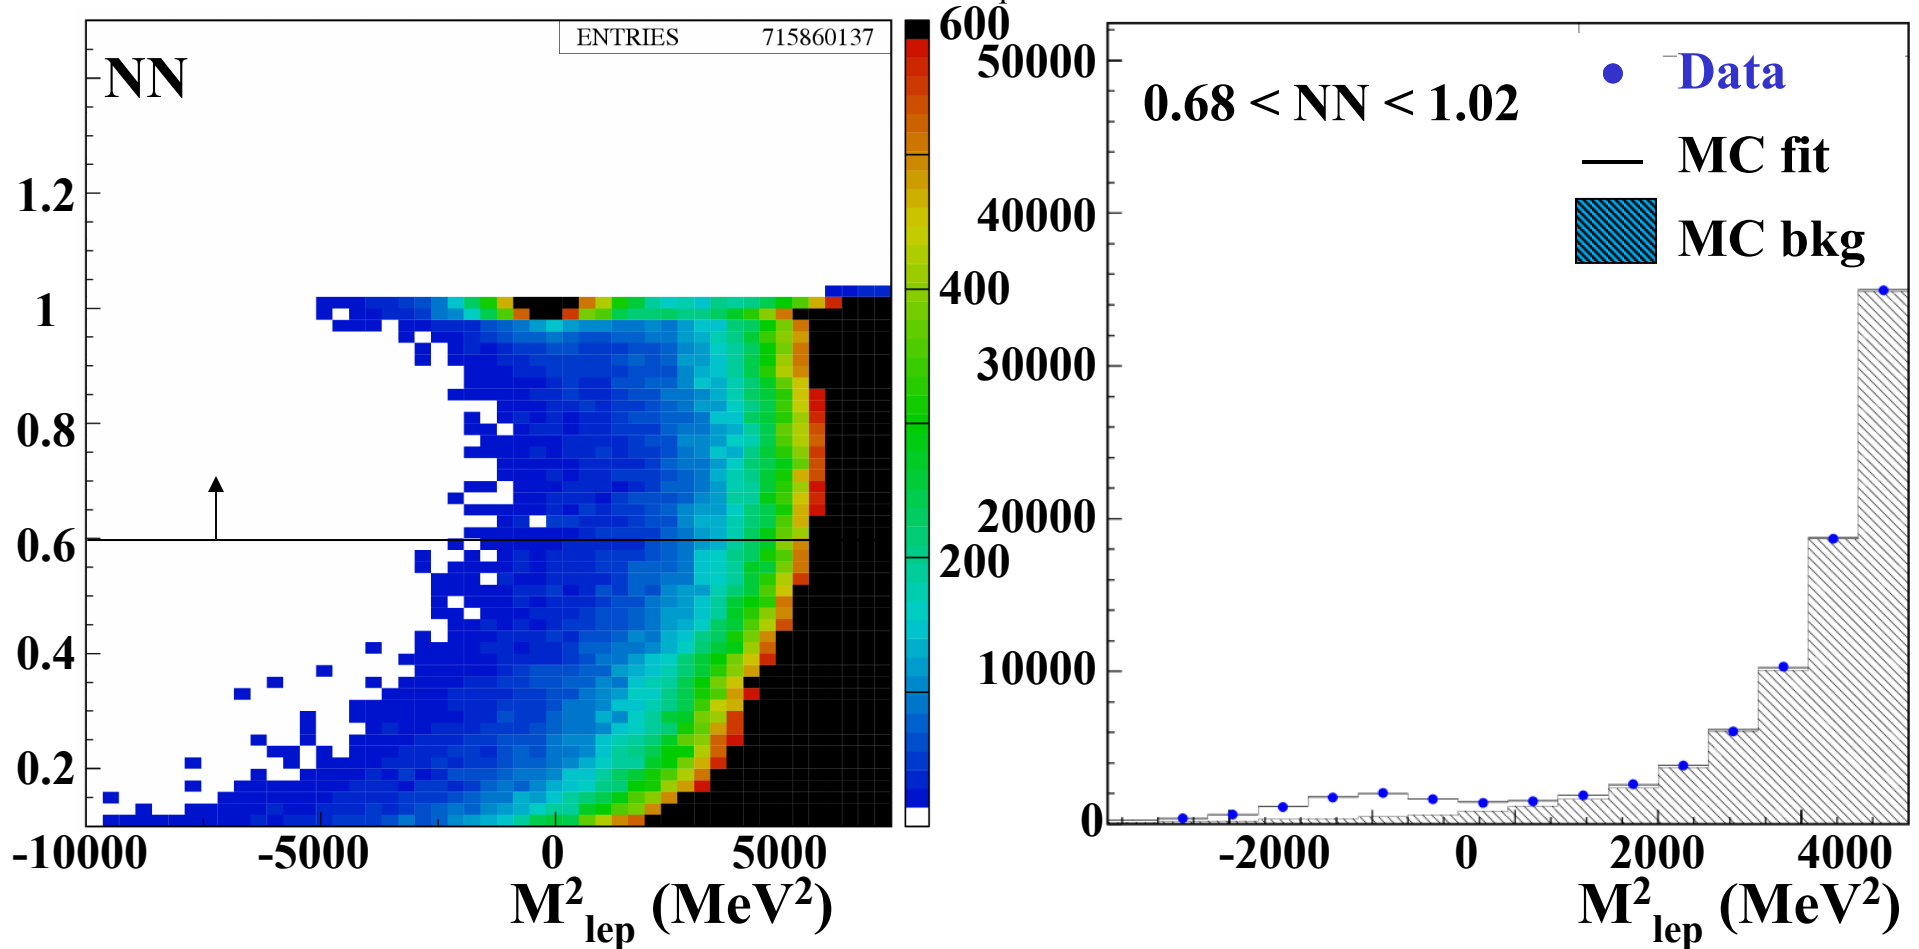

Count in entire statistics:  $N_{Ke2}(e^+) = 7060(98)$ ,  $N_{Ke2}(e^-) = 6750(97)$

# $R_K$ analysis: fitting for $Ke2$ counting

Assess fit systematic error (**0.3%**) varying fit region:

NN lower limit: 0.78–0.94;  $M_{lep}^2$  upper limit: 4500–7500  $\text{MeV}^2$ .

Vary significantly contamination + lever arm to assess fit systematics

# $R_K$ analysis: radiative corrections

To match theory, has to count **IB** only

Expect **DE**  $\sim$  **IB** , but we poorly know

$$\delta\text{DE}/\text{DE} \sim 15\%$$

- Fit using **IB+DE**, count **IB** by considering as “signal” events those with  $E_\gamma^* < 20$  MeV
- Correct for **IB** tail,  $\epsilon^{\text{IB}} = 95.28(5)$
- Repeat fit varying **DE** by its 15% uncertainty, **get 0.45% error...**

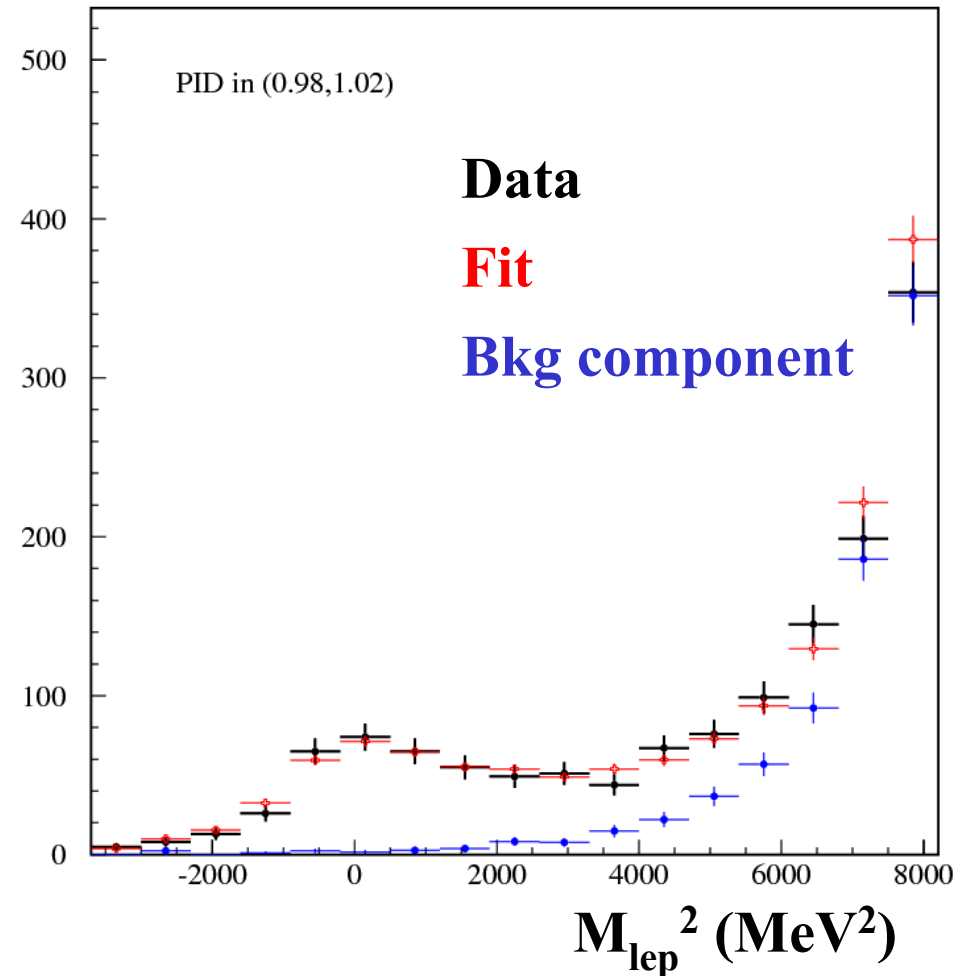

...too bad. Perform a dedicated analysis to measure DE:

- Explicitly detect radiated photon
- Compare DE/IB ratio with expectation from theory

# $R_K$ analysis: radiative corrections

- Pass from IB/DE  $\sim 9$  to IB/DE  $\sim 0.6$  by explicitly detecting radiated  $\gamma$
- Count 752(36) + 692(36) events
- Obtain:  $IB/(IB+DE) = 0.5153(96)$
  
- Agrees with expectation,  $IB_{SM}/(IB_{SM}+DE_{mmt}) = 0.509(38)$
- Allow **systematics** from DE to IB measurement to be pushed **down at 0.1%**

**Dedicated analysis under the review of the collaboration.**

## $R_K$ : systematic error budget

Source	Systematic error [%]		Main method
	Stat	Syst	
Reconstruction	0.4	0.4	Control samples
Trigger efficiency	0.4		Downscaled events
Bkg subtraction		0.3	Fit range variation
Ke2(DE) component	0.1		Measurement on data
Clustering for e, $\mu$	0.3		KL control samples
<b>Total</b>	<b>0.6</b>	<b>0.5</b>	

Further systematic check: use same algorithms to measure  $R_3 = K_{e3}/K_{\mu3}$

$$R_3 = 1.507 \pm 0.005 \text{ for } K^+$$

$$R_3 = 1.510 \pm 0.006 \text{ for } K^-$$

world avg  $R_3 = 1.506 \pm 0.003$  (FlaviaNet)

## $R_K$ : result

$$R_K = (2.493 \pm 0.025 \pm 0.019)10^{-5}$$

- Statistical error is 1.1% (0.85 from 14k Ke2 events  $\oplus$  bkg subtraction)

- Systematic error is dominated by statistics again (0.015)

- Measurement do not depend on K charge, good systematic check:  $K^+$ : 2.496(37) vs  $K^-$ : 2.490(38) (uncorrelated errors only)

- Measurement agrees with SM prediction,  $R_K = 2.477(1)$

# $R_K$ : sensitivity to NP

Sensitivity shown as 95%-CL excluded regions in the  $\tan\beta$  -  $M_H$  plane, for fixed values of the 1-3 slepton-mass matrix element,  $\Delta_{13} = 10^{-3}, 0.5 \times 10^{-3}, 10^{-4}$

WA w new KLOE result:  $R_K = 2.468(25) \times 10^{-5}$

# *Conclusions and future plans*

---

Still a lot of very good physics from the  $2.5 \text{ fb}^{-1}$  on tape, while preparing for the  $xx \text{ fb}^{-1}$  regime.

## **Hadron physics: $\sigma(e^+e^- \rightarrow \pi^+\pi^-)$ published**

- $F_\pi$  from off-peak data, large angle analysis;  $F_\pi$  from ratio of  $\pi\pi\gamma$  to  $\mu\mu\gamma$  events.
- $\eta$ -ology
- analysis of  $\gamma\gamma \rightarrow \pi^0\pi^0$  (search for the  $\sigma(600)$ )

## **Kaon physics: $R_K$ final results**

- CPT tests from interferometry
- $\text{BR}(K^\pm \rightarrow \pi^\pm \pi^+ \pi^-)$ ,  $K_S$  and  $K_L$  lifetimes, FF slopes from  $K_{13}$  decays,  $\text{BR}(K_S \rightarrow \pi\mu\nu)$
- Rare  $K_S$  decays

## Spare slides

# KLOE measurement of $\sigma_{\pi\pi}$

- a) 2 tracks with  $50^\circ < \theta_{\text{track}} < 130^\circ$
- b) small angle  $\gamma$  ( $\theta_{\pi\pi} < 15^\circ$  or  $> 165^\circ$ )
  - high statistics for ISR
  - low relative FSR contribution
  - suppressed  $\phi \rightarrow \pi^+\pi^-\pi^0$  wrt the signal

kinematics:  $p_\gamma = p_{\text{miss}} = -(p_+ + p_-)$

**Statistics: 242 pb $^{-1}$ ,  
3.1 Mevents between 0.35 and 0.95 GeV $^2$ .**

theoretical fractional error on  $a_\mu = 0.6\%$

Theoretical predictions on  $a_\mu$  vs BNL result:

KLOE08 strengthens the discrepancy between SM and experiment ( $\sim 3.3\sigma$ )

# $R_K$ at KLOE: $p_K$ determination

Get rid of bad- $P_K$  component using redundant measurement

Get rid of bad- $P_1$ 's using asymmetry of DC hits in left and right views

# $R_K$ analysis, “Kaography”

## DC inner wall “Kaography”

In doing extrapolation for K, material budget is a key issue:  $\beta_K \sim 0.2$

For the Carbon-fiber DC inner wall, sensitivity on thickness difference  $\Delta_{DC}$  wrt nominal value of 0.9 mm is order of 10  $\mu\text{m}$

Get rid of bad- $P_1$ 's using fit quality + asymmetry of DC hits in L & R views

- For PID, build variables using essentially cluster information.
- Rejection from PID: now  $>1000$   $\rightarrow$  loosen kinematic selection criteria

- Ke2 counts: two-dimensional binned likelihood fit in the  $(NN, M^2_{lep})$  plane

# $R_K$ analysis: efficiency evaluation

Reconstruction efficiency from MC, corrections from control samples

Select  $K^{+,-}_{\mu 2}$  and  $K^{+,-}_{e 3}$  in events tagged by identification of a  $K^{-,+}_{\mu 2}$  decay

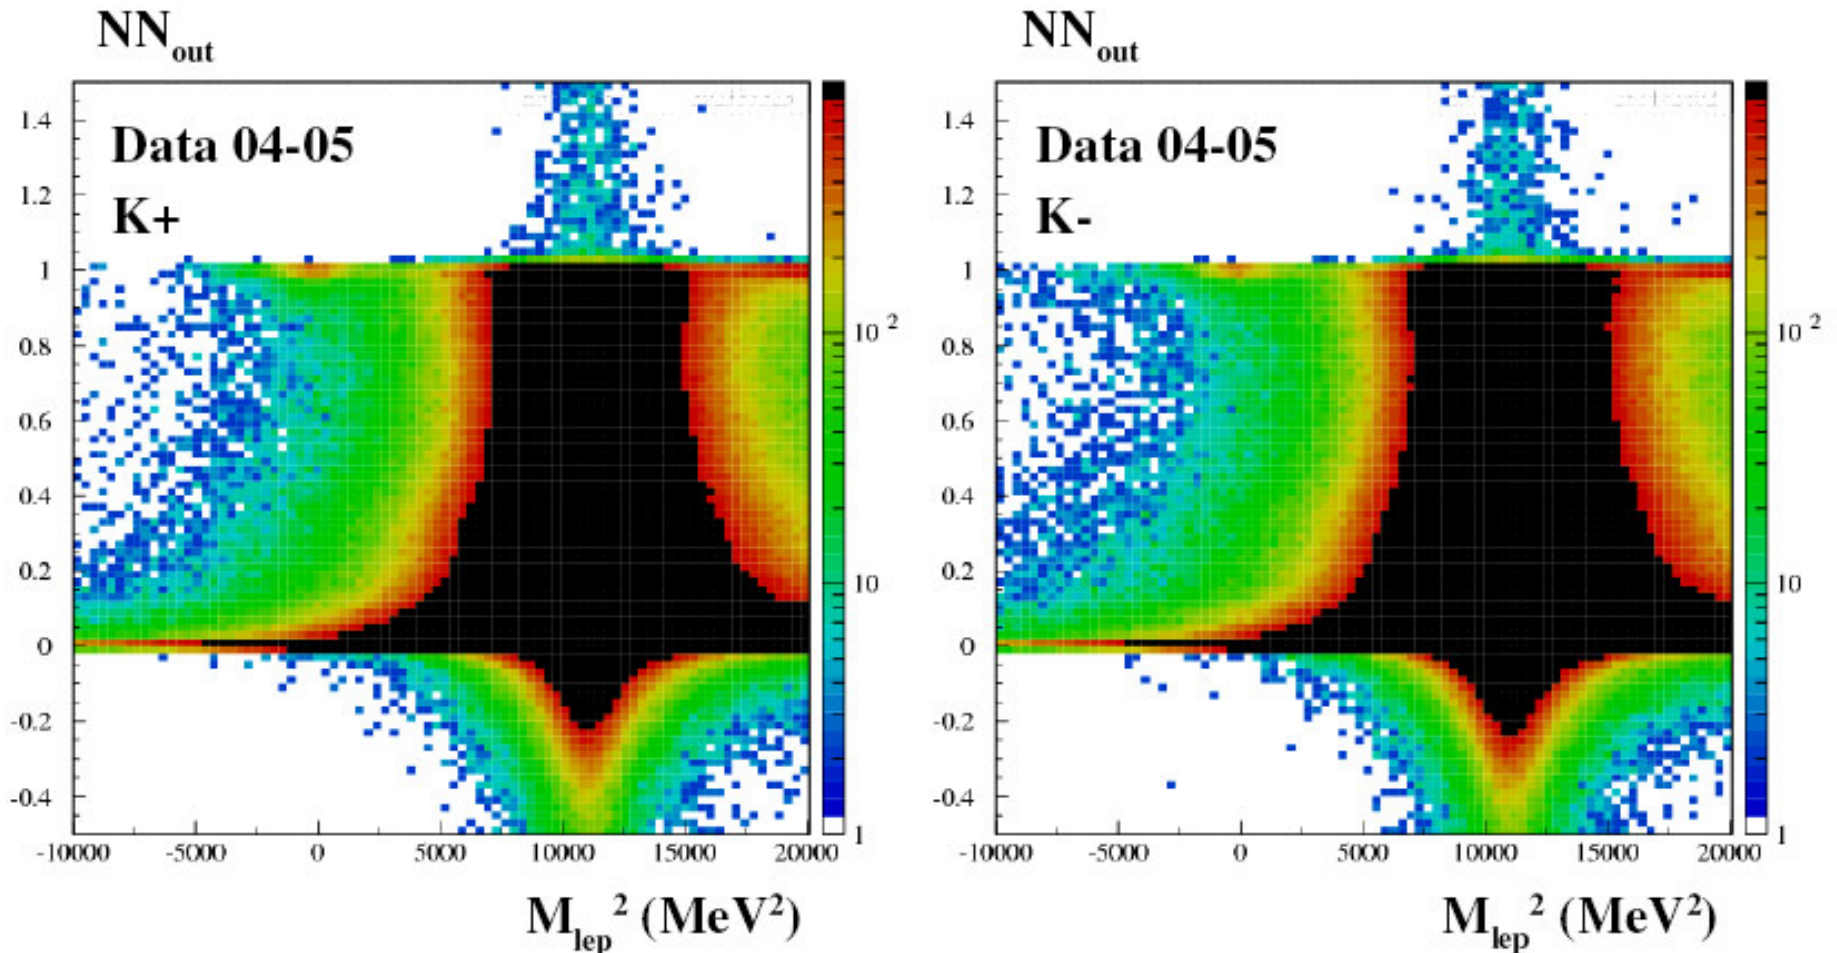

Fit  $P_{\mu}(P_e)$  using  $\mu(e)$  cluster r,t (& E), kinematics: no K,  $\mu(e)$  trks required

# *Analysis of $R_K$ : NN vs $M_{LEP}^2$ plane*

Associate track to EmC clusters for e/ $\mu$  separation, evaluate PID (NN)

# $R_K$ at KLOE: kinematic rejection (old)

Enough bkg rejection from kinematics to see Ke2 w/o any EmC-based PID

**MC** agrees with data, including very far resolution tails

# Analysis of $R_K - PID$ via EmC

Impact of PID: retain 60% of signal, reject all but 0.2% of background

Check with  $K_{Le3}$  data/MC control samples

After PID (rejection factor is  $\sim 500$ ) count  $K_{e2}$  events

# Analysis of $R_K$ : Ke2 event counting (old)

Ke2 event counts: likelihood fit of  $M_{LEPT}$  vs  $E_{RMS}$ .

Input: MC shapes for Ke2( $\gamma$ ) and background.

Fir parameters: # of Ke2 and bkg; result:  $8090 \pm 160$  observed events.

## $R_K$ at KLOE: *a-priori* error on $M_{LEP}^2$

Better parametrization of kinematic criteria, better understanding of bkg

$M_{lep}^2 = f(P_K, P_l, \cos\theta) \rightarrow$  *a-priori* error  $\delta M_{lep}^2$  is scaled by **opening angle**

Achieve cancellation in  $Ke2/K\mu2$  efficiencies, applying  $\cos\theta$  trailing cuts
