

Flavour at LHCb

Recent results and prospects

Conor Fitzpatrick
On behalf of the LHCb Collaboration

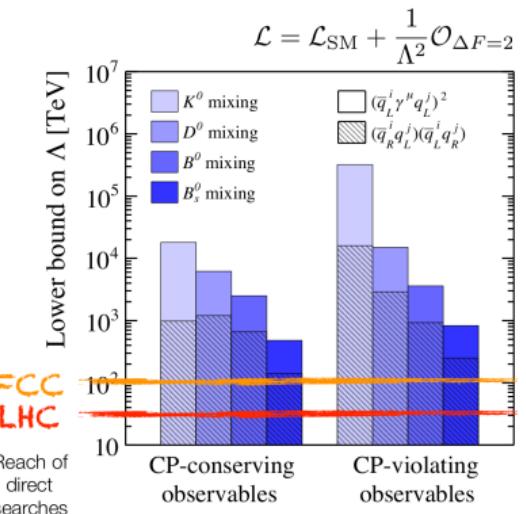

7th Workshop on Theory, Phenomenology & Experiments in Flavour Physics
8-10 June 2018
Vill Orlandi, Anacapri

C. Fitzpatrick

June 8, 2018

Why measure properties of heavy flavour?

- ▶ Speaking to a biased audience here, but personal (Experimental) opinion:

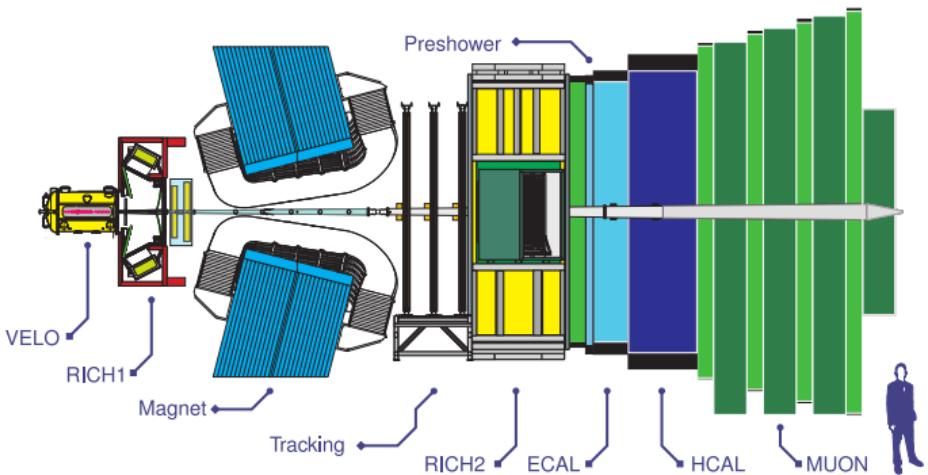

- ▶ **Complementarity:** Probes effects of new particles at energy scales inaccessible in direct searches
- ▶ **Variety:** From time-dependent measurements of \mathcal{CP} observables to rare decay searches, there is a wealth of experimental challenges
- ▶ **Necessity:** There is much we do not know about the nature of the universe, and many places to look:
 - ▶ If new particles are observed at the (HL)LHC, we must probe their flavour structure
 - ▶ If no new particles are observed, measurements in quantum loops can tell us what to build next

C. Fitzpatrick

June 8, 2018

LHCb: The precision flavour experiment

- ▶ LHCb was built to study beauty and charm at the LHC:

- ▶ Precise particle identification (RICH + MUON)
- ▶ Excellent decay time resolution: $\sim 45\text{fs}$ (VELO)
- ▶ High purity + Efficiency with flexible trigger

LHCb Highlights & Prospects

The LHCb dataset

- ▶ 2018 is the last year of data taking with the present LHCb detector

- ▶ Hoping to collect 2.5fb^{-1} this year, total Run 1 + Run 2 dataset $> 9\text{fb}^{-1}$
- ▶ Run 2 dataset benefits from increased cross-sections and improved trigger

Recent highlights

LHCb Highlights &
Prospects

Introduction

Highlights

CKM angle γ
weak phase ϕ_s

$b \rightarrow s\ell\ell$

$b \rightarrow c\ell\nu$

Prospects

Conclusions

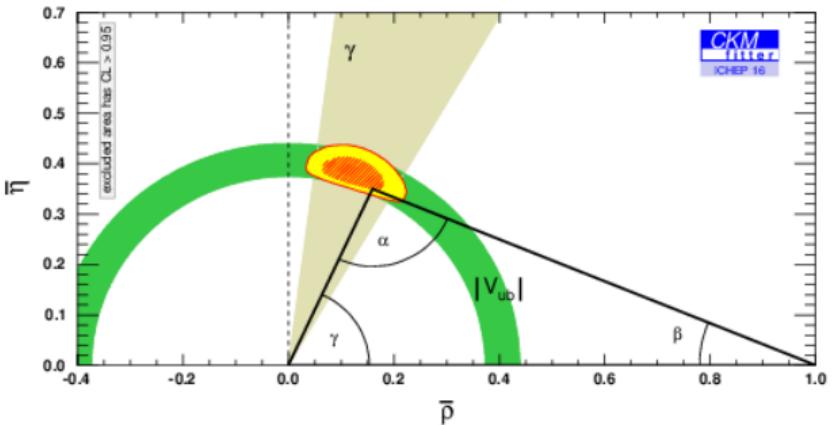

- ▶ LHCb has a broad physics programme, covering much more than just b - and c -physics
 - ▶ Electroweak measurements
 - ▶ Spectroscopy
 - ▶ Heavy Ion & fixed-target physics
- ▶ Today I will present some recent highlights, starting with \mathcal{CP} and finishing with rare and semileptonic ratios

C. Fitzpatrick

ÉCOLE POLYTECHNIQUE
FÉDÉRALE DE LAUSANNE

- ▶ γ is the least well measured angle of the UT
- ▶ Can be measured in modes dominated by tree-level contributions: Constrains the UT apex

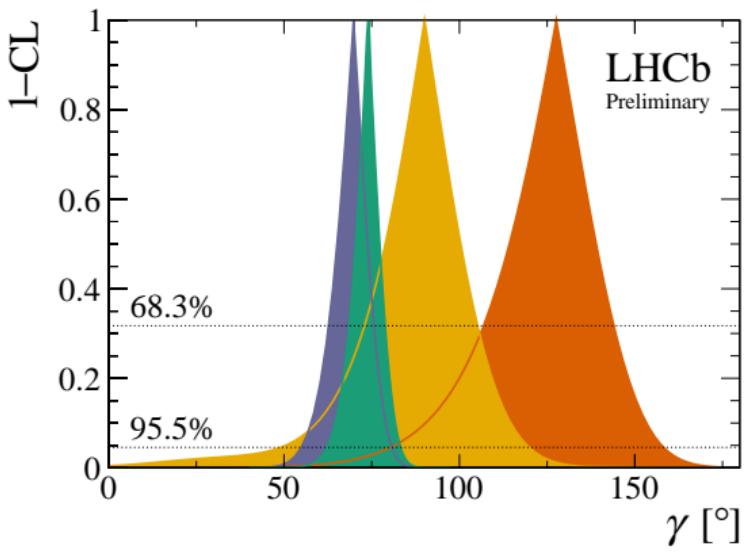

- ▶ No current measurement has a precision better than 10° : **Make multiple measurements and combine**

C. Fitzpatrick

CKM angle γ LHCb-CONF-2018-002

- LHCb combination with Run 1 and several Run 2 inputs:

$B_s^0 \rightarrow D_s^\mp K^\pm$ time-dep

$B^0 \rightarrow DK^{*0}$

$B^0 \rightarrow DK^+ \pi^-$

$B^0 \rightarrow D^\mp \pi^\pm$ time-dep

$B^+ \rightarrow DK^+$

$B^+ \rightarrow D^* K^+$

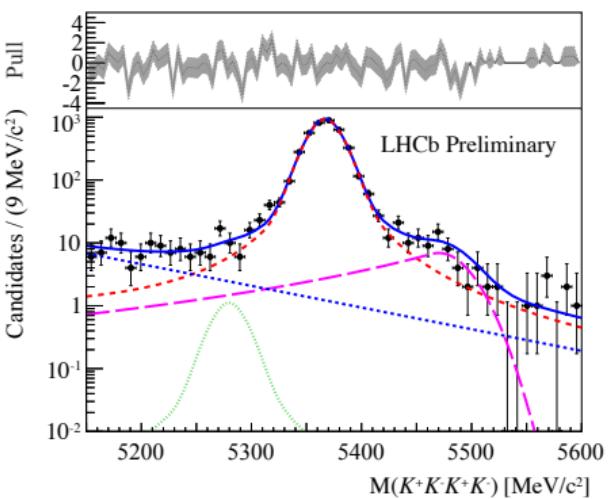

$B^+ \rightarrow DK^{*+}$

$B^+ \rightarrow DK^+ \pi^+ \pi^-$

- LHCb finds $\gamma = (74.0^{+5.0}_{-5.8})^\circ$ using a frequentist combination.
- Compare to indirect determination: $\gamma = (65.33^{+0.96}_{-2.54})^\circ$ [CKMFitter]

ϕ_s^{sss} in $B_s^0 \rightarrow \phi\phi$ LHCb-CONF-2018-001 PRELIMINARY

- ▶ Weak phase $\phi_s^{c\bar{c}s}$: \mathcal{CP} violation in the interference between mixing and decay of B_s^0 mesons
- ▶ LHCb has made world best measurements in $B_s^0 \rightarrow J/\psi(KK, \pi\pi), B_s^0 \rightarrow D_s D_s$
- ▶ ϕ_s^{sss} accessible in $B_s^0 \rightarrow \phi\phi$:
 - ▶ Signal yield of ~ 8500 with 5fb^{-1} of Run 1 + Run 2 data

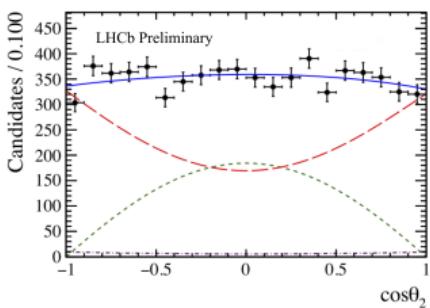

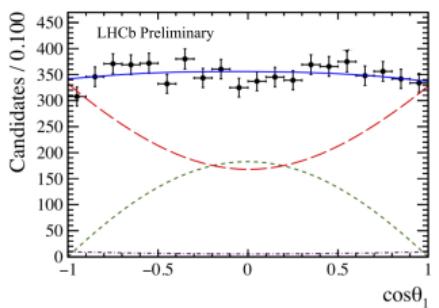

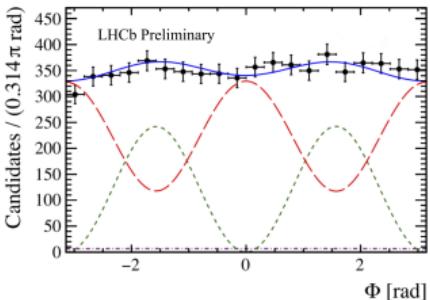

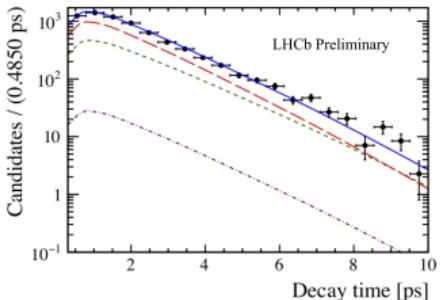

- ▶ $\Lambda_b \rightarrow \phi p K^-$ and $B^0 \rightarrow \phi\phi$ components included in the fit
- ▶ No significant B^0 component. Limit set:
$$\mathcal{B}(B^0 \rightarrow \phi\phi) < 2.4 \times 10^{-8} \text{ [90%CL]}$$

C. Fitzpatrick

June 8, 2018

ϕ_s^{sss} in $B_s^0 \rightarrow \phi\phi$ LHCb-CONF-2018-001 PRELIMINARY

- ϕ_s^{sss} extracted from fit to time and angular distributions of background subtracted $B_s^0 \rightarrow \phi\phi$:

- $\phi_s^{sss} = -0.07 \pm 0.13 \text{ (stat)} \pm 0.03 \text{ (syst)} \text{ rad}$ (preliminary)
- c.f.QCD factorisation limit: $|\phi_s^{sss}| < 0.02 \text{ rad}$

10 / 22

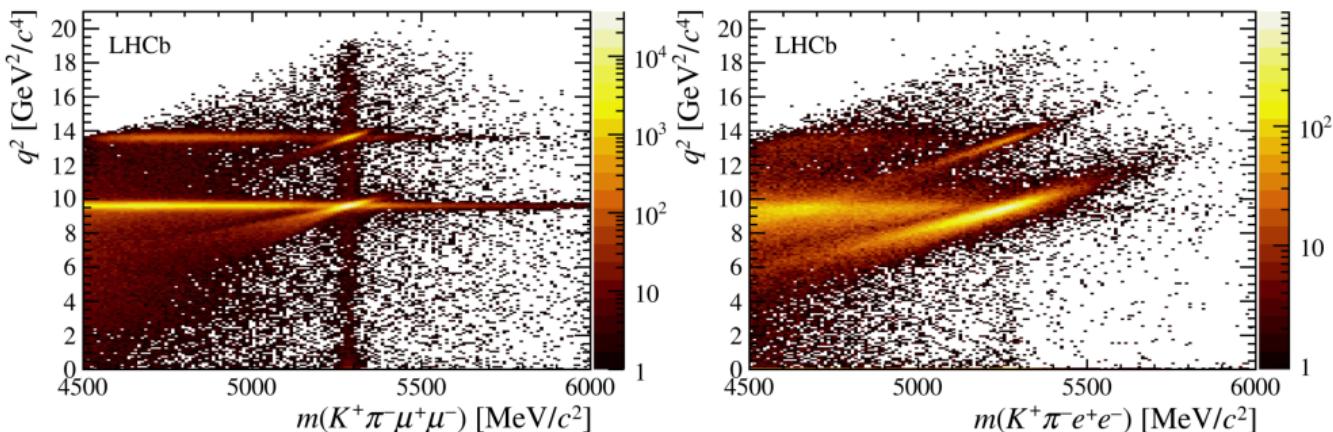

- LFU test: $R(K^*) = \frac{\mathcal{B}(B^0 \rightarrow K^* \mu^- \mu^+)}{\mathcal{B}(B^0 \rightarrow K^* e^- e^+)} = 1 \pm \mathcal{O}(10^{-3})$

- Measure double ratios to minimise uncertainties:

$$R(K^*) = \frac{\mathcal{B}(B^0 \rightarrow K^* \mu^- \mu^+)}{\mathcal{B}(B^0 \rightarrow K^* J/\psi (\rightarrow \mu^- \mu^+))} / \frac{\mathcal{B}(B^0 \rightarrow K^* e^- e^+)}{\mathcal{B}(B^0 \rightarrow K^* J/\psi (\rightarrow e^- e^+))}$$

- Experimentally challenging due to differences in detection and selection of μ^-, e^-
- Muons have excellent resolution and background rejection
- Measured in two q^2 regions: $[0.045, 1.1]$ (low) and $[1.1, 6]$ GeV^2/c^4 (central)

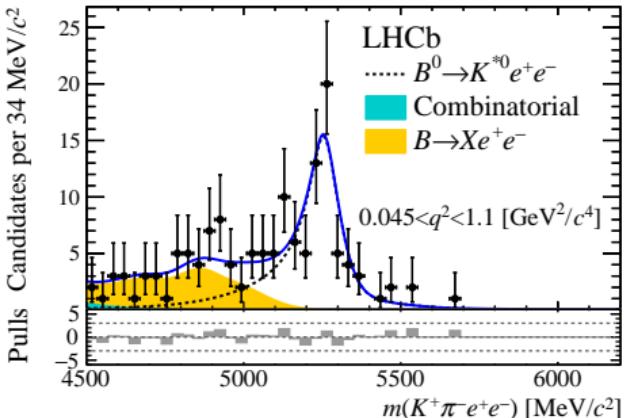

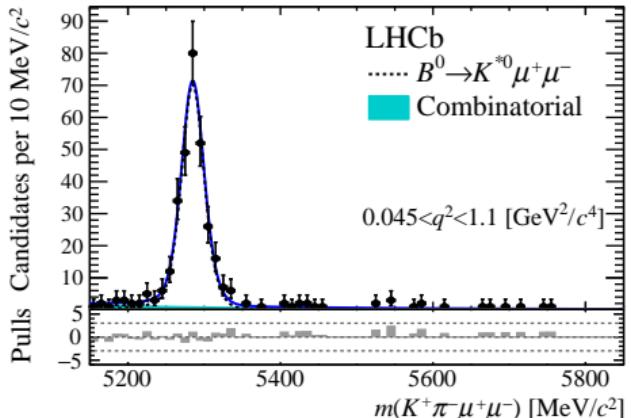

- Radiative J/ψ tail an important component of the central q^2 invariant mass fit

C. Fitzpatrick

LHCb Highlights & Prospects

Introduction

Highlights

CKM angle γ
weak phase ϕ_s

$b \rightarrow s\ell\ell$

$b \rightarrow c\ell\nu$

Prospects

Conclusions

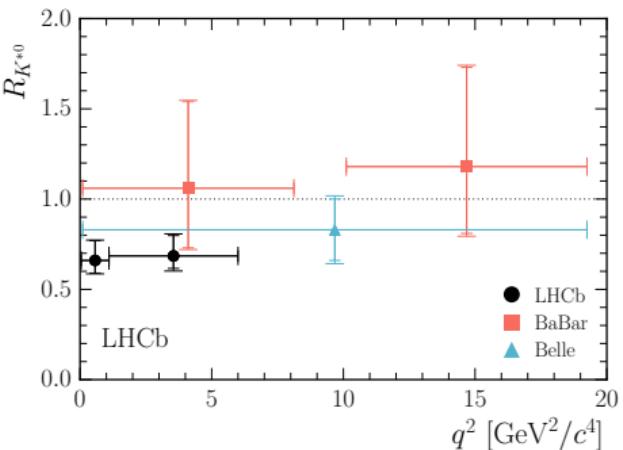

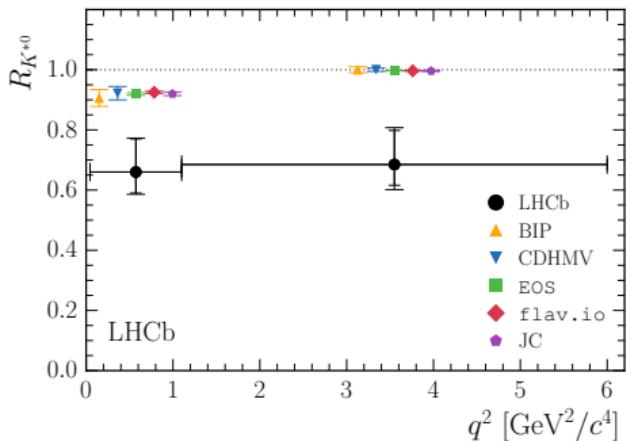

- ▶ Simultaneous fit finds:

$$R_{K^{*0}} = \begin{cases} 0.66_{-0.07}^{+0.11} (\text{stat}) \pm 0.03 (\text{syst}) & \text{for } 0.045 < q^2 < 1.1 \text{ GeV}^2/c^4, \\ 0.69_{-0.07}^{+0.11} (\text{stat}) \pm 0.05 (\text{syst}) & \text{for } 1.1 < q^2 < 6.0 \text{ GeV}^2/c^4. \end{cases}$$

- ▶ Results compatible at $\sim 2 - 2.5\sigma$ level to the SM

C. Fitzpatrick

June 8, 2018

- Results are more sensitive than, and compatible with the B-factories
- LHCb measured $R(K)$ in 2014 and also found a 2.6σ compatibility PRL 113, 151601 (2014)

C. Fitzpatrick

June 8, 2018

- ▶ Ratios of semileptonic decays are similarly interesting:
- ▶ $R(D^{*-}) = \mathcal{B}(B^0 \rightarrow D^{*-} \tau^+ \bar{\nu}_\tau) / \mathcal{B}(B^0 \rightarrow D^{*-} \mu^+ \bar{\nu}_\mu)$
- ▶ LHCb has made several measurements:
 - ▶ Using $\tau^- \rightarrow \mu^- \bar{\nu}_\tau \bar{\nu}_\mu$ PRL 115, 111803 (2015)
 - ▶ Using three-prong $\tau^- \rightarrow \pi^- \pi^+ \pi^-$ decays PRL 120, 171802 (2018)
 - ▶ $R(J/\psi)$ using $B_c^+ \rightarrow J/\psi \tau^+ \bar{\nu}_\mu$ PRL 120, 121801 (2018)

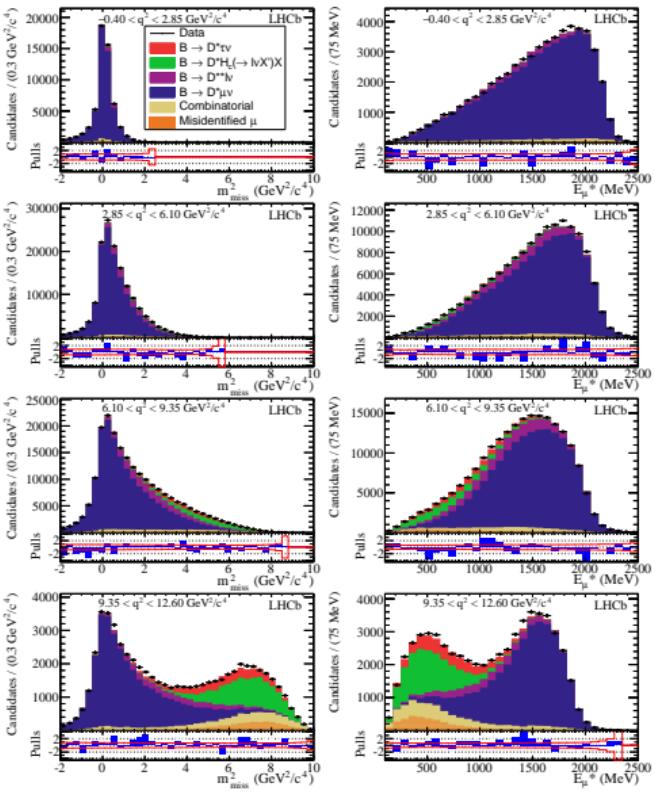

Muonic $R(D^{*-})$ PRL 115, 111803 (2015)

- ▶ Fit in bins of q^2 to missing mass² and muon energy, E_μ^*
- ▶ Signal (red) more visible in higher q^2 bins
- ▶ Significant background from DD with one $D \rightarrow \mu X$

$$\mathcal{R}(D^*) = 0.336 \pm 0.027(\text{stat}) \pm 0.030(\text{syst})$$

LHCb, 3fb^{-1}

- ▶ 2.1σ above SM expectation
- ▶ Systematic uncertainty dominated by simulation sample size

$b \rightarrow s\ell\ell$

$b \rightarrow c\ell\nu$

Prospects

Conclusions

C. Fitzpatrick

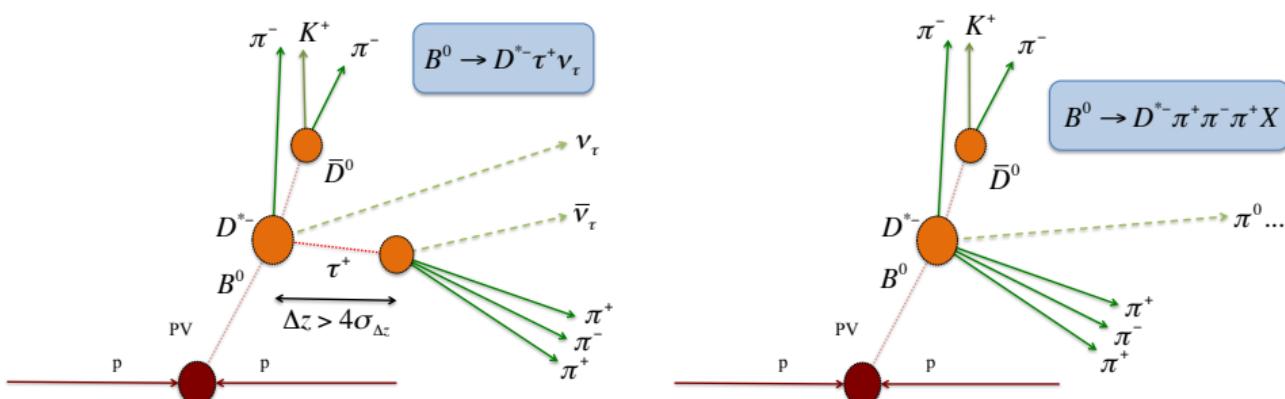

June 8, 2018

Three-prong $R(D^{*-})$ PRL 120, 171802 (2018)

- ▶ Uses nonresonant $B^0 \rightarrow D^{*-} 3\pi$ as normalisation channel:

$$R(D^{*-}) = \frac{\mathcal{B}(B^0 \rightarrow D^{*-} \tau^+ \nu_\tau)}{\mathcal{B}(B^0 \rightarrow D^{*-} 3\pi)} \times \frac{\mathcal{B}(B^0 \rightarrow D^{*-} 3\pi)}{\mathcal{B}(B^0 \rightarrow D^{*-} \mu^+ \nu_\mu)}$$

- ▶ Benefits from good τ^- vertex, and no background from μ^- mode
- ▶ Main source of background is $B \rightarrow D^{*-} 3\pi X$. Suppressed by B^0 - τ^- vertex separation in beam axis:

Conclusions

C. Fitzpatrick

June 8, 2018

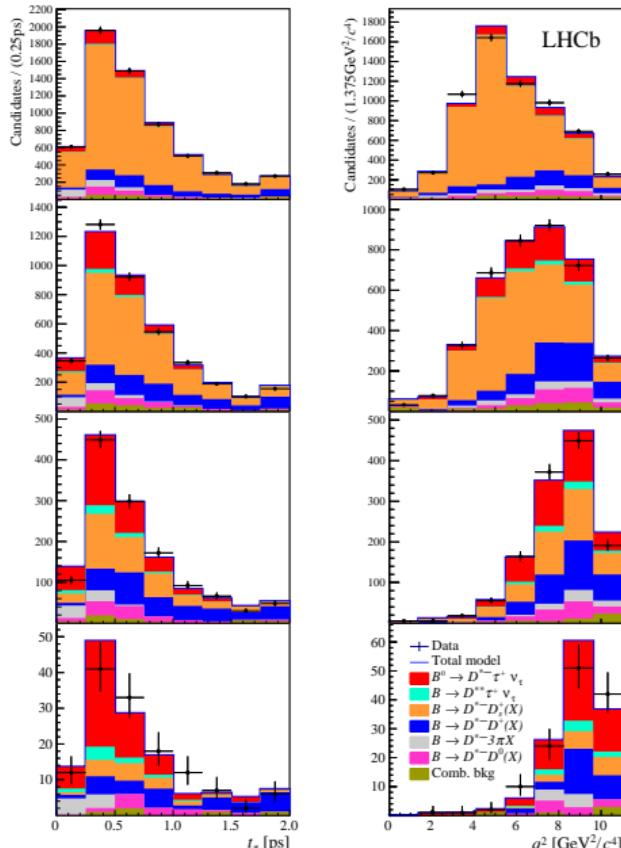

Three-prong $R(D^{*-})$ PRL 120, 171802 (2018)

- ▶ 3D fit to bins of BDT output, τ^- decay time and q^2
- ▶ Templates determined from simulation and control channels
- ▶ Signal yield: 1300 ± 85

$$\mathcal{R}(D^*) = 0.291 \pm 0.019(\text{stat}) \pm 0.026(\text{syst}) \pm 0.013(\text{ext})$$

LHCb, 3fb^{-1}

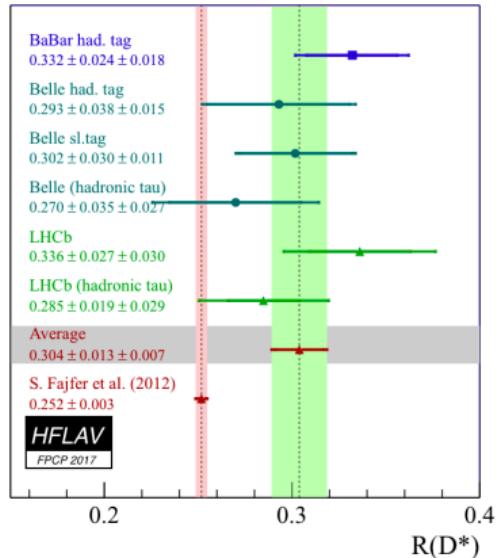

- ▶ Compatible with SM expectation at 1σ
- ▶ Systematic uncertainty dominated by simulation sample size

C. Fitzpatrick

June 8, 2018

$b \rightarrow c\ell\nu$ summary

- ▶ There is a consistent tension between predictions and experimental results for $R(D^{*-})$
- ▶ LHCb results are compatible with the B factories, pattern seems to emerge
- ▶ Not shown in this talk: $R(J/\psi)$ also shows some tension at the 2σ level in the muon channel.

C. Fitzpatrick

June 8, 2018

Prospects with current dataset

- ▶ $b \rightarrow s\ell\ell$:
 - ▶ $R(K), R(K^*)$ updates using partial Run 2 dataset underway, expect $\sim 3 \times$ more $B^+ \rightarrow K^+ e^- e^+$ candidates
 - ▶ Potential to include additional high q^2 bins, but challenging to fit this region:
 - ▶ Pollution from below: rare decays with higher K, K^* resonances
 - ▶ Pollution from above: $\psi(2S) \rightarrow K$
 - ▶ Several additional modes under study: $R(K\pi\pi), R(pK), R(\phi)$
- ▶ For $b \rightarrow c\ell\nu$:
 - ▶ Strong potential for improved sensitivity at LHCb using Run 2 dataset: $3 \times$ the signal yields
 - ▶ systematic uncertainties will decrease
 - ▶ $R(J/\psi)$ three prong analysis is also underway.

Future prospects

LHCb Highlights & Prospects

Introduction

Highlights

CKM angle γ
weak phase ϕ_s

$b \rightarrow s\ell\ell$
 $b \rightarrow c\ell\nu$

Prospects

Conclusions

- ▶ Looking beyond Run 2:
 - ▶ 2019-2021: LHCb will undergo a major upgrade
 - ▶ From 2021: 5 × the instantaneous luminosity and a completely new readout/trigger
 - ▶ Aim to collect 50fb⁻¹ in 2021-2029
 - ▶ A second major upgrade for the HL-LHC era to collect 300fb⁻¹
- ▶ With 50fb⁻¹ LHCb will reach precisions of [LHCb-PUB-2014-040](#):
 - ▶ $\sigma(\gamma) = 1^\circ$
 - ▶ $\sigma(\phi_s^{c\bar{c}s}) = 0.009\text{rad}$, $\sigma(\phi_s^{s\bar{s}s}) = 0.02\text{rad}$
- ▶ $b \rightarrow s\ell\ell$ analyses will need to control electron systematic uncertainties to benefit from upgrade
 - ▶ Uncertainty from background models (data driven) will scale

C. Fitzpatrick

June 8, 2018

Conclusions

- ▶ LHCb has made many interesting measurements in heavy flavour with the Run 1 dataset
- ▶ Run 2 analyses already starting to appear
- ▶ LHCb currently dominates world averages in several beauty \mathcal{CP} measurements
 - ▶ Looking forward to stiff competition from Belle II
- ▶ Some intriguing discrepancies in ratios of B decays to leptons
 - ▶ Results with more data will help clarify the situation

C. Fitzpatrick
