

Towards V13 of 700T Simulation

S.M. Valle, F. Gargano, G. Battistoni

6 November 2017

Once upon a time... there was V12.4

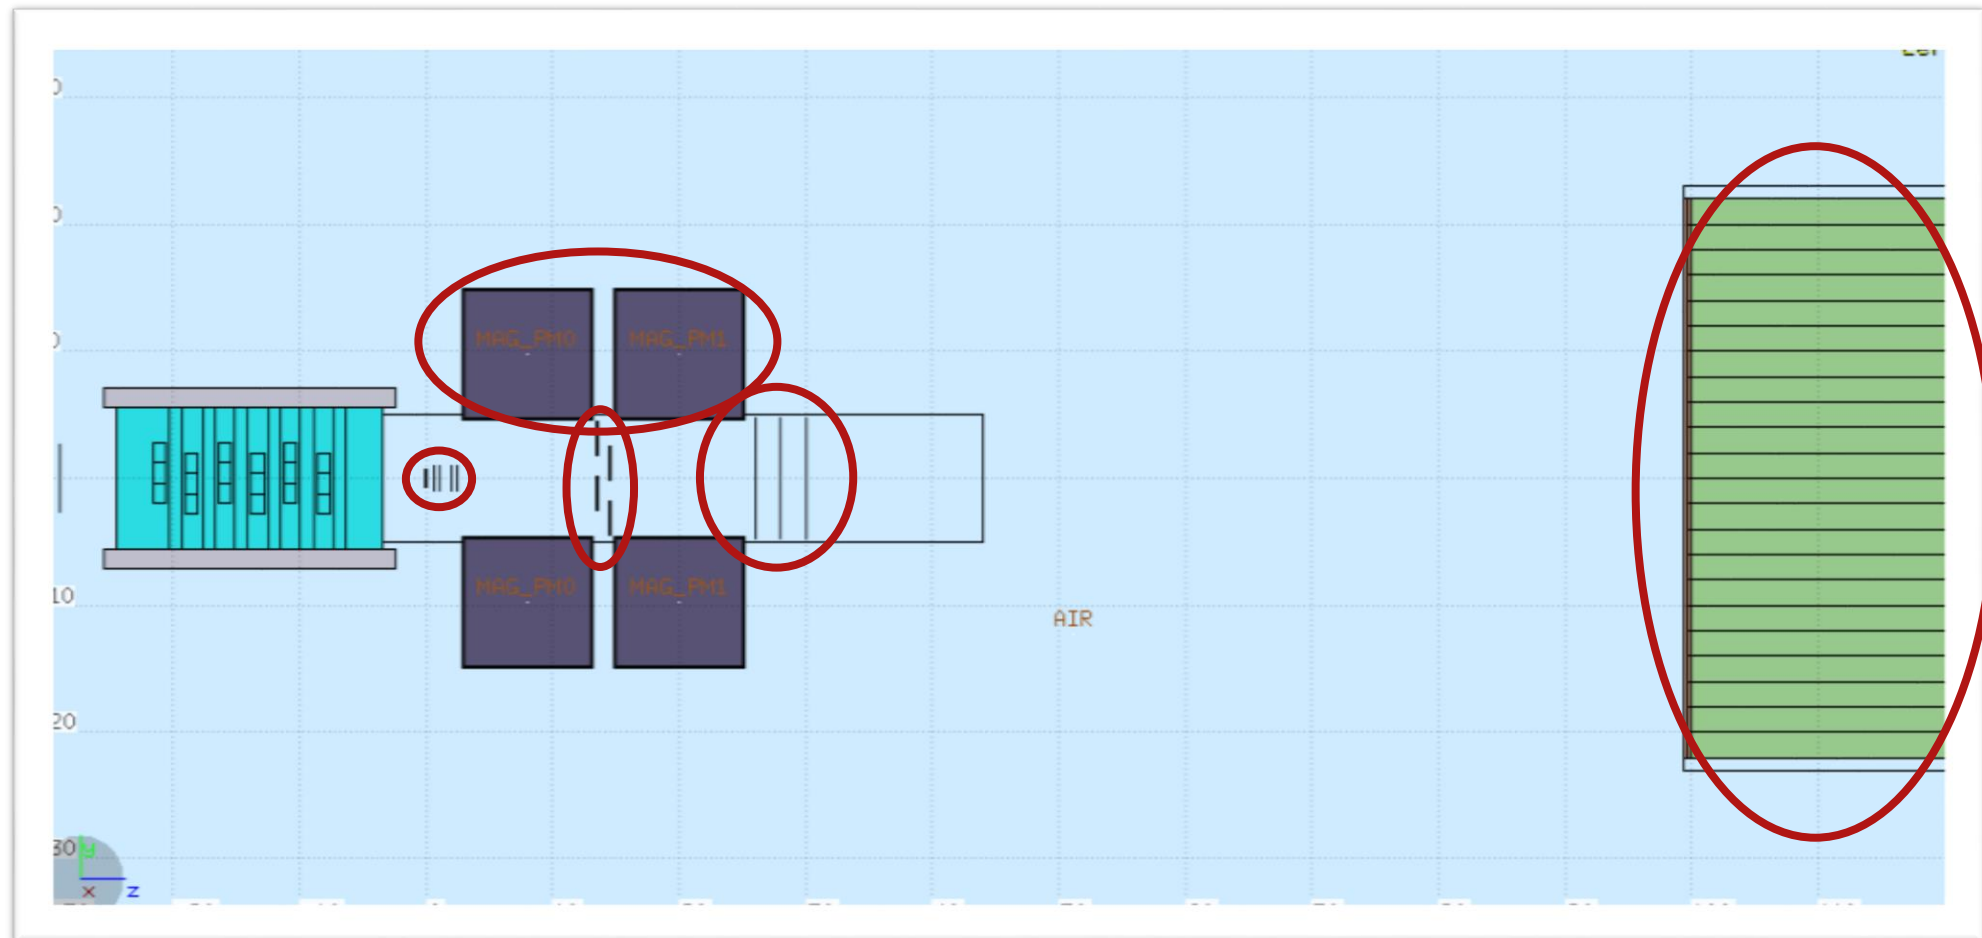

Several simulations with high statistics available on Tier3 server :

- ▶ Beams: C, O
Recently added: He
- ▶ Targets: C, C₂H₄
- ▶ Energies: 200, 350 and 700 MeV/n

(see the [Twiki page](#) of the available simulation files)

V13: what's new?

Calorimeter

DONE

- ▶ Calorimeter BGO crystals have been **lengthened from 14 to 21 cm** since, hopefully, we will inherit ~21 cm long crystals from L3 experiment at LEP

TO DO

- ▶ Will they be **parallelepipeds or truncated pyramids**?
- ▶ Calorimeter is currently positioned 1 m downstream of the target, but this **distance** can still be optimized

Magnets

DONE

- ▶ The construction of **two identical magnets** is cheaper, so in V13 both magnets have an angular acceptance of 10°
- ▶ The magnets **thickness** (in red) has been enlarged to a more realistic value

TO DO

- ▶ Overall final **dimensions** have still to be defined. In particular, the length in z has to be decided (compromise btw cost and $B dl$)
- ▶ **Magnetic map** is still approximated (when there will be a ~ finalized geometry we will ask for a realistic one)

Vertex

DONE

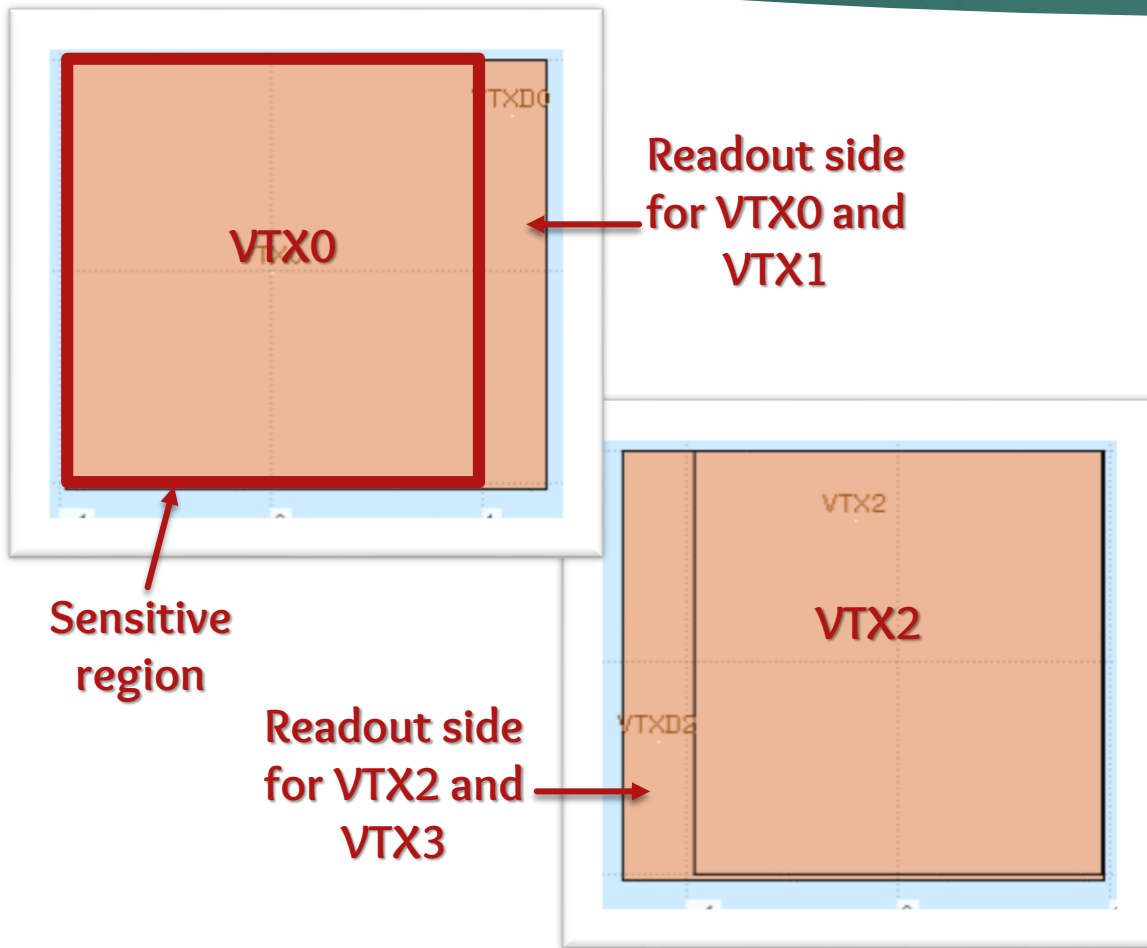

- ▶ Due to readout reasons, the vertex layers have been **coupled** and distances btw them have been modified as depicted in figure

TO DO

- ▶ **Distance** from the target still has to be optimized
- ▶ Introduce the **electronic boards** that will surround the sensors

Vertex

DONE

- ▶ Real MIMOSA28 geometry has been implemented:
 - ▶ Total area: $20,22 \times 22,71 \text{ mm}^2$
 - ▶ Active area: $\sim 19,21 \times 19,87$
 - ▶ Pixel pitch: $20,7 \text{ }\mu\text{m}$
 - ▶ 928 rows x 960 columns
 - ▶ Thickness: $50 \text{ }\mu\text{m}$
- ▶ The two planes in the same couple will be read from the same side, while the others from the opposite
- ▶ Improved management of **simulated hits** in pixels

Inner Tracker

DONE

- ▶ The Inner Tracker has been **split in 4**: the **PLUME geometry** has been implemented, along with real MIMOSA28 geometry (see Vertex)

TO DO

- ▶ **Distances** btw PLUMEs (in z and y) have to be optimized

Inner Tracker

Microstrip Detector

Two versions :

- V13.0
- V13.1

V13.0

11

- 2 Si planes (50 μm ÷70 μm thick)
- Kapton foil (30 μm thick)
- Distance btw layers = 2 cm
- LGAD system
- Strip dim = (125x125) μm^2

For each view :

- Dead spaces (1 mm thick)
- Active Si regions (1.5 cm thick)

Fig. 1

Fig. 2

V13.1

- 1 single Si plane (150 μm thick)
- No Kapton foil
- No dead spaces
- Strip dim = (125x125) μm^2
- Distance btw layers = 2 cm
- No LGAD system

Fig. 3

Future works

- ▶ **Simulation of FOOT V13** is not yet available on Tier3, but we are going to produce them as soon as also the FLUKA routines needed to run the simulation will be finished
- ▶ We are currently working to **integrate the geometry software in the reconstruction framework**
- ▶ Still, a lot of **parameters have to be optimized and defined** in order to be correctly reproduced in simulation:
 - ▶ Distance from target of Vertex, Calorimeter, ecc.
 - ▶ Distances btw the PLUMEs and btw the Microstrip Detector layers
 - ▶ Layout of the Microstrip Detector
 - ▶ Dimensions of the magnets
 - ▶ Calorimeter shape and dimensions
- ▶ Provide the **final magnetic map**
- ▶ Moreover, in the reconstruction stage, we have to introduce:
 - ▶ **Clustering** in Inner Tracker and calorimeter
 - ▶ Dependence of the scintillator luminous response on the **hit position**

Thank you
