

The carbon fusion reaction at stellar energies

Monday, 25 June 2018 12:45 (15 minutes)

The carbon fusion reaction is a crucial reaction in stellar evolution. Due to its complicated reaction mechanism, there is a large uncertainty in the reaction rate which limits our understanding to various stellar objects, such as massive stars, type Ia supernovae, and superbursts. In this talk, I will review the challenges in the study of carbon burning. I will also report recent results from our studies: 1) an upper limit for the $^{12}\text{C} + ^{12}\text{C}$ fusion cross sections; 2) examination of the predictive power of extrapolating models for the carbon fusion reaction at stellar energies. An outlook for the future studies will also be presented.
