Frascati Spring School 2018, 07.05.18

Weak decays violate CP

- CKM phase: $\delta^q \approx 69^\circ$
- PMNS phase: $\delta^\ell \sim -90^\circ$ (?)

Strong CP problem

- CP -violating term allowed by Standard Model symmetries

$$\mathcal{L} \supset \bar{\theta} \frac{g^2}{32\pi^2} G_{\mu\nu} \tilde{G}^{\mu\nu}$$

- but no CP violation is observed in strong interactions!
- $\bar{\theta} \lesssim 10^{-10}$ from neutron EDM [Pendlebury et al '15]

Solution: Peccei-Quinn mechanism [Peccei, Quinn '77, Weinberg '78, Wilczek '78]

PQ mechanism introduces an **axion**

Ingredients in a PQ solution

- Global $U(1)_{PQ}$ symmetry with chiral anomaly
- Complex scalar field $\varphi \rightarrow \langle \varphi \rangle$ which breaks $U(1)_{PQ}$

$U(1)_{PQ}$ does not need to be put in by hand!

→ *accidental* PQ symmetry

In recent paper [FB, Chun, King '17] we connected an accidental $U(1)_{PQ}$ to the flavons that control Yukawa structures

→ the axion is *flavoured*

See also

- Flaxion [Ema, Hamaguchi, Moroi, Nakayama '16]
- Axiflavor [Calibbi, Goertz, Redigolo, Ziegler, Zupan '16]

A **unified** model of flavour

- o Pati-Salam gauge group $SU(4)_C \times SU(2)_L \times SU(2)_R$
Vertical unification
- o A_4 family symmetry
Horizontal unification (of LH fermions)

[King, 1301.1340]

Can accommodate all quarks/leptons, masses + mixings

Features

- LH fermions unified in triplets of A_4 : e.g. $F_1 = (u, c, t)$
- They couple to scalar fields ϕ that are
 - triplets under A_4
 - singlets under Pati-Salam
- Yukawa couplings become *dynamical*: $y_{ij} FF^c H \rightarrow \frac{\langle \phi_i \rangle}{M} F_i F_j^c H$
- Lagrangian has accidental $U(1)_{PQ}$ symmetry!
- Axion lives inside (multiple) ϕ
- PQ scale f_a fixed by same mechanics that fix flavour scale

$f_a \gtrsim 10^{12}$ GeV is close to cosmological upper bound

Dark matter axion? Mass: $m_a \sim 1 - 10 \mu\text{eV}$

Axion couplings to matter predicted by Yukawa structures

Flavour violation via axion interactions!

Flavoured axions contribute to many flavour-violating decays (suppressed by v_{PQ})

Example: $K^+ \rightarrow \pi^+ a$ (e.g. NA62 experiment)

$$\text{Br}(K^+ \rightarrow \pi^+ a) = \frac{1}{\Gamma(K^+)} \frac{|V_{21}^d|^2}{16\pi} \frac{m_K^3}{v_{PQ}^2} \left(1 - \frac{m_\pi^2}{m_K^2}\right)^3 |f_+(0)|^2$$

with $f_+(0) \approx 1$.

- Experiments [E787, E949] constrain the ratio

$$\frac{v_{PQ}}{|V_{21}^d|} \gtrsim 7 \times 10^{11} \text{ GeV}$$

- NA62 experiment predicts order of magnitude improvement in limit – approaching predicted range from model!

Other interesting decays

- $\mu^+ \rightarrow e^+ a$ (e.g. MEG experiment)
- $\mu^+ \rightarrow e^+ a \gamma$
- $K_L^0 \rightarrow \pi^0 a$ (e.g. KOTO, KLEVER)
- $B^\pm \rightarrow K^\pm(\pi^\pm) a$ (e.g. Belle-II, LHCb)

Other searches

- Haloscopes (e.g. ADMX): searching for axion DM
(ADMX sensitive to predicted mass range ($m_a \sim$ a few μeV))
- Helioscopes (e.g. CAST, IAXO)
probing $g_{a\gamma}$ and g_{ae}

1. The great advantage of the unified approach is that predictions are *correlated* and *fixed*.
2. Once flavour observables are determined, all axion couplings are immediately known.
3. Potentially rich phenomenology, but heavy suppression by f_a .
4. No new scalar field is needed to accommodate axion – already present in the theory!

Pati-Salam [$SU(4)_C \times SU(2)_L \times SU(2)_R$]

- Left-handed fermions in

$$F_i \sim (4, 2, 1)_i = \begin{pmatrix} u_r & u_g & u_b & \nu \\ d_r & d_g & d_b & e \end{pmatrix}_i$$

- Right-handed fermions in

$$F_i^c \sim (\bar{4}, 1, 2)_i = \begin{pmatrix} u_r^c & u_g^c & u_b^c & N^c \\ d_r^c & d_g^c & d_b^c & e^c \end{pmatrix}_i$$

A₄

- Left-handed fermions in triplet

$$F \sim 3 = (F_1, F_2, F_3)$$

- Right-handed fermions in singlets

$$F_1^c, F_2^c, F_3^c \sim 1$$

Constrained sequential dominance (CSD) [King '99, '00, '02]

o SD originally devised for neutrinos:

- 1) $N_{\text{atm}} \rightarrow$ atmospheric mass m_{ν_3} and mixing $\theta_{23} \sim 45^\circ$
- 2) $N_{\text{sol}} \rightarrow$ solar mass m_{ν_2} and solar+reactor mixing θ_{12}, θ_{13}
- 3) N_{dec} , if present, nearly decoupled from theory $\rightarrow m_{\nu_1} \ll m_{\nu_{2,3}}$

CSD(n) with two neutrinos:

$$Y^\nu = \begin{pmatrix} 0 & b & * \\ a & nb & * \\ a & (n-2)b & * \end{pmatrix}, \quad M_R \sim \text{diag}(M_{\text{atm}}, M_{\text{sol}}, M_{\text{dec}})$$

$$\begin{aligned} m^\nu &= v^2 Y^\nu M_R^{-1} (Y^\nu)^T \\ &= m_a \begin{pmatrix} 0 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 1 & 1 \end{pmatrix} + m_b \begin{pmatrix} 1 & n & n-2 \\ n & n^2 & n(n-2) \\ n-2 & n(n-2) & (n-2)^2 \end{pmatrix} + m_c \begin{pmatrix} * & * & * \\ * & * & * \\ * & * & * \end{pmatrix} \end{aligned}$$

- In unified scenario, CSD is extended to the quarks!
- Consider $n = 4$ [King '13]. With Y^d diagonal,

$$Y^u = Y^\nu = \begin{pmatrix} 0 & b & * \\ a & 4b & * \\ a & 2b & * \end{pmatrix}$$

- To first approximation, Cabibbo angle

$$\theta_{12}^q \approx \frac{Y_{12}^u}{Y_{22}^u} \approx \frac{1}{4}$$

- This is compellingly close to the true value $\theta_{12}^q \approx 0.227$.

- CSD(4) achieved by A_4 triplet flavons ϕ
- Flavons acquire VEVs with particular alignments:

$$\begin{aligned} \langle \phi_1^u \rangle &= v_{\phi_1^u} (0, 1, 1), & \langle \phi_1^d \rangle &= v_{\phi_1^d} (1, 0, 0) \\ \langle \phi_2^u \rangle &= v_{\phi_2^u} (1, 4, 2), & \langle \phi_2^d \rangle &= v_{\phi_2^d} (0, 1, 0) \end{aligned}$$

- Example: first-generation up-type quarks

$$W \supset \frac{(F \cdot \phi_1^u) h_u F_1^c}{M} \rightarrow v_u \frac{v_{\phi_1^u}}{M} (F_1 F_2 F_3) \begin{pmatrix} 0 \\ 1 \\ 1 \end{pmatrix} F_1^c$$

- Alignments can be fixed by A_4 and orthogonality arguments, implemented by a superpotential

Full Yukawa/mass superpotential

$$\begin{aligned}
 W_F^{\text{eff}} &= (F \cdot h_3) F_3^c + \frac{(F \cdot \phi_1^u) h_u F_1^c}{\langle \Sigma_u \rangle} + \frac{(F \cdot \phi_2^u) h_u F_2^c}{\langle \Sigma_u \rangle} \\
 &\quad + \frac{(F \cdot \phi_1^d) h_d F_1^c}{\langle \Sigma_{15}^d \rangle} + \frac{(F \cdot \phi_2^d) h_{15}^d F_2^c}{\langle \Sigma_d \rangle} + \frac{(F \cdot \phi_1^u) h_d F_1^c}{\langle \Sigma_d \rangle} \\
 W_{\text{Maj}}^{\text{eff}} &= \frac{\overline{H^c H^c}}{\Lambda} \left(\frac{\xi^2}{\Lambda^2} F_1^c F_1^c + \frac{\xi}{\Lambda} F_2^c F_2^c + F_3^c F_3^c + \frac{\xi}{\Lambda} F_1^c F_3^c \right)
 \end{aligned}$$

Notes

- $\overline{H^c} \sim (4, 1, 2)$ breaks $SU(4)_C \rightarrow SU(3)_C$, generates $RH\nu$ masses
- $\Sigma \sim (1/15, 1, 1) \rightarrow \langle \Sigma \rangle \lesssim M_{\text{GUT}}$
- $\xi \sim (1, 1, 1) \rightarrow \langle \xi \rangle / \Lambda \sim 10^{-5}$

Discrete \mathbb{Z}_N symmetries

- \mathbb{Z}_5
Shaping symmetry of original A to Z model
Ensures CSD(4)
- \mathbb{Z}_3
Ensures PQ symmetry at renormalisable level
Forbids most off-diagonal terms in $Y^{d,e}$ (new!)
- \mathbb{Z}'_5
Protects PQ symmetry to sufficient order

Yukawa and mass matrices

$$Y^u = Y^\nu = \begin{pmatrix} 0 & b & \epsilon_{13}C \\ a & 4b & \epsilon_{23}C \\ a & 2b & c \end{pmatrix} \quad Y^d = \begin{pmatrix} y_d^0 & 0 & 0 \\ By_d^0 & y_s^0 & 0 \\ By_d^0 & 0 & y_b^0 \end{pmatrix}$$

$$Y^e = \begin{pmatrix} -(y_d^0/3) & 0 & 0 \\ By_d^0 & xy_s^0 & 0 \\ By_d^0 & 0 & y_b^0 \end{pmatrix} \quad M_R = \begin{pmatrix} M_1 & 0 & M_{13} \\ 0 & M_2 & 0 \\ M_{13} & 0 & M_3 \end{pmatrix}$$

Neutrino matrix after seesaw,

$$m^\nu = m_a \begin{pmatrix} 0 & 0 & 0 \\ 0 & 1 & 1 \\ 0 & 1 & 1 \end{pmatrix} + m_b e^{i\eta} \begin{pmatrix} 1 & 4 & 2 \\ 4 & 16 & 8 \\ 2 & 8 & 4 \end{pmatrix} + m_c e^{i\xi} \begin{pmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

PQ charges

$$\begin{aligned}
 W_F^{\text{eff}} \sim & (F \cdot h_3) F_3^c + (F \cdot \phi_1^u) h_u F_1^c + (F \cdot \phi_2^u) h_u F_2^c \\
 & \begin{matrix} 0 & 0 & 0 & 0 & 2 & 0 & -2 & 0 & 1 & 0 & -1 \end{matrix} \\
 & + (F \cdot \phi_1^d) h_d F_1^c + (F \cdot \phi_2^d) h_{15}^d F_2^c + (F \cdot \phi_1^u) h_d F_1^c \\
 & \begin{matrix} 0 & 2 & 0 & -2 & 0 & 1 & 0 & -1 & 0 & 2 & 0 & -2 \end{matrix} \\
 W_{\text{Maj}}^{\text{eff}} \sim & \overline{H^c} \overline{H^c} (\xi \xi F_1^c F_1^c + \xi F_2^c F_2^c + F_3^c F_3^c + \xi F_1^c F_3^c) \\
 & \begin{matrix} 0 & 0 & 2 & 2 & -2 & -2 & 2 & -1 & -1 & 0 & 0 & 2 & -2 & 0 \end{matrix}
 \end{aligned}$$

Notes

- PQ symmetry realised also at renormalisable level
- Higgs sector completely neutral \rightarrow no GUT-scale PQ breaking
- $U(1)_{PQ}$ assignments unique
- Third family is neutral

Breaking $U(1)_{PQ}$

- $\phi_i^f \rightarrow \langle \phi_i^f \rangle \sim v_{\phi_1^f}$ breaks all discrete symmetries *and* $U(1)_{PQ}$
- PQ-breaking scale

$$v_{PQ}^2 = (N_a f_a)^2 = \sum_{\phi} x_{\phi}^2 v_{\phi}^2$$

- Dominated by largest VEV: $\langle \phi_2^u \rangle$ (related to charm mass)

Axion

$$a = \frac{1}{v_{PQ}} \sum_{\varphi} x_{\varphi} v_{\varphi} a_{\varphi}$$

Domain wall number

$$N_a \equiv \left| 6x_F + 2 \sum_i x_{F_i^c} \right| = |6(0) + 2(-2 + -1 + 0)| = 6$$

Protecting the PQ symmetry

Consider terms like

$$\frac{\{\phi\}^n}{M_P^n} W$$

These generate a PQ-breaking axion mass

$$m_*^2 \sim m_{3/2}^2 \frac{V_{PQ}^{n-2}}{M_P^{n-2}}$$

[Holman et al '92]

[Kamionkowski, March-Russell '92]

[Barr, Seckel '92]

We require $m_*^2/m_a^2 < 10^{-10}$, where

$$m_a^2 \approx m_\pi^2 \frac{f_\pi^2}{f_a^2}$$

To protect our solution, we forbid all PQ-violating terms like $\{\phi\}^n$ up to $n = 7$ (or $dim = 10$)!

Fitting to quark and lepton mixing data

Simple MCMC

- Minimise χ^2 to find best fit

$$\chi^2 = \sum_i \left(\frac{P(x_i) - \mu_i}{\sigma_i} \right)^2$$

- Calculate 95% credible intervals (hpd)

Measured values run up to M_{GUT} (assuming MSSM) [Antusch, Maurer '13]

$$W_{\text{driving}} = P_{1,2}^{u,d} (\bar{\phi}_{1,2}^{u,d} \phi_{1,2}^{u,d} - M^2) + P_{\xi} (\bar{\xi}\xi - M^2),$$

Field	G_{PS}	A_4	\mathbb{Z}_5	\mathbb{Z}_3	\mathbb{Z}'_5	R	$U(1)_{PQ}$
$\phi_{1,2}^u$	(1, 1, 1)	3	α^4, α^2	β^2, β	γ^2, γ	0	2, 1
$\phi_{1,2}^d$	(1, 1, 1)	3	α^3, α	β^2, β	γ^2, γ	0	2, 1
ξ	(1, 1, 1)	1	α^4	β^2	γ^2	0	2
$\bar{\phi}_{1,2}^u$	(1, 1, 1)	3	α, α^3	β, β^2	γ^3, γ^4	0	-2, -1
$\bar{\phi}_{1,2}^d$	(1, 1, 1)	3	α^2, α^4	β, β^2	γ^3, γ^4	0	-2, -1
$\bar{\xi}$	(1, 1, 1)	1	α	β	γ^3	0	-2

Yukawa matrices can be diagonalised by bi-unitary matrices $V_{L,R}^{u,d}$, $U_{L,R}^e$

$$Y^{u,\text{diag}} = V_L^u Y^u (V_R^u)^\dagger,$$

$$Y^{d,\text{diag}} = V_L^d Y^d (V_R^d)^\dagger,$$

$$Y^{e,\text{diag}} = U_L^e Y^e (U_R^e)^\dagger.$$

We transform the fields by

$$Q \rightarrow (V_L^u)^\dagger Q,$$

$$d^c \rightarrow (V_R^d)^\dagger d^c,$$

$$u^c \rightarrow (V_R^u)^\dagger u^c.$$

Then $Y^u \rightarrow Y^{u,\text{diag}}$, $Y^d \rightarrow V_{\text{CKM}} Y^{d,\text{diag}}$, where $V_{\text{CKM}} = V_L^u (V_L^d)^\dagger$.
