Metamaterials: a new dimension in electromagnetism

Thursday, 4 October 2018 09:00 (45 minutes)

Building any device requires the use of materials and in electromagnetism it is often the case that nature does not provide what we need. Hence the concept of a metamaterial which adds the engineering subwavelength structure within a material to the choice of chemical composition. In this way entirely novel properties have been realised most prominent of which have been metamaterials with a negative refractive index. I shall outline the development of the field with some examples of applications and the more recent applications to commercial products.

Summary

Primary author: Prof. PENDRY, John (Imperial College London)

Presenter: Prof. PENDRY, John (Imperial College London)

Session Classification: Satellite Meeting on Metamaterials
