Casimir effect as a probe for extended theories of gravity

Wednesday, 20 February 2019 18:30 (1 minute)

In this talk, I explore the Casimir effect for a massless scalar field in the context of a generic curved background. In this perspective, the mean vacuum energy density and the pressure between the binding plates are the relevant physical objects to evaluate. After the above general discussion, a systematic procedure to derive interesting pieces of information on the free parameters of extended theories of gravity is presented. In particular, I focus the attention on some recent results regarding the Standard Model Extension and several quadratic models of gravity.

Summary

Primary authors: PETRUZZIELLO, Luciano (Istituto Nazionale di Fisica Nucleare); LAMBIASE, Gaetano (SA); BUONINFANTE, Luca (SA); BLASONE, Massimo (SA); Dr STABLE, Antonio (INFN, Sezione di Napoli, Gruppo collegato di Salerno)

Presenter: PETRUZZIELLO, Luciano (Istituto Nazionale di Fisica Nucleare)

Session Classification: Poster session

Track Classification: Beyond Einstein's Gravity
