## Summary

## Abstract

Quantum mechanics is at the basis of our understanding of all matter and - since with the behavior of matter we explore space and time - also of our understanding of space-time. In the recent years, also quantum technologies became more and more important for practical purposes. This includes quantum sensors, quantum metrology, quantum information, quantum cryptography, quantum computing, etc. Of particular importance is the coupling of quantum matter to gravity. In this talk we collect the foundations of quantum mechanics, the foundations of relativistic gravity, and corresponding tests, in particular tests exploring the quantum-gravity interaction. Also the relevance of this research for practical purposes is described.

## Summary

# Quantum mechanics: the postulates

► the physical system: quantum object

$$|\psi\rangle \in \mathcal{H}$$

# Quantum mechanics: the postulates

- ▶ the physical system: quantum object
- ▶ quantization

$$x \rightarrow \hat{x}$$

$$p \rightarrow \hat{p}$$

# Quantum mechanics: the postulates

- ▶ the physical system: quantum object
- ▶ quantization
- ▶ measurement process

$$|\psi\rangle \xrightarrow{\hat{A}} \{a, |a\rangle, |\langle a|\psi\rangle|^2\}$$

# Quantum mechanics: the postulates

- ▶ the physical system: quantum object
- ▶ quantization
- ▶ measurement process
- ▶ dynamics: Schrödinger equation

$$i\hbar\partial_t |\psi\rangle = \hat{H}(\hat{x}, \hat{p}) |\psi\rangle$$

## Quantum mechanics: the postulates

- ▶ the physical system: quantum object
- ▶ quantization
- ▶ measurement process
- ▶ dynamics: Schrödinger equation

$$i\hbar\partial_t |\psi\rangle = \hat{H}(\hat{x}, \hat{p}) |\psi\rangle$$

everything works extremely well: **all** experiments can be completely understood in terms of their calculation

- ▶ energy levels: quantum systems are characterized by a finite number of numbers
- ▶ entanglement

"Biphoton symbolic representation" by Neolexx/Wikimedia

$$\frac{1}{\sqrt{2}} (|0\rangle_A \otimes |1\rangle_B - |1\rangle_A \otimes |0\rangle_B)$$

## Quantum mechanics: Main phenomena

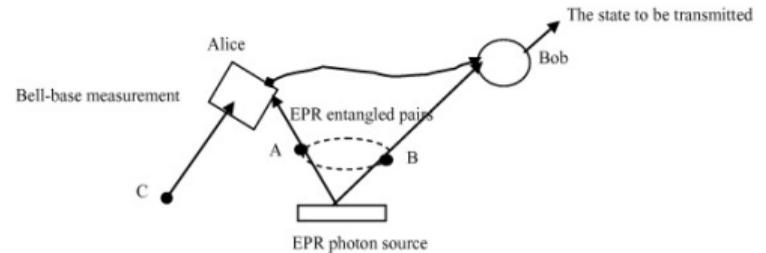

- ▶ for all physical systems: interference, diffraction, ..., impossibility to get which-way information, delayed-choice experiment, action-at-a-distance a la Aharonov-Bohm, ...
- ▶ energy levels: quantum systems are characterized by a finite number of numbers
- ▶ entanglement
- ▶ no cloning - no broadcasting

no unitary operation  $U$  with

$$U |\psi\rangle \otimes |0\rangle = |\psi\rangle \otimes |\psi\rangle$$

# Quantum mechanics: Main phenomena

- ▶ for all physical systems: interference, diffraction, ..., impossibility to get which-way information, delayed-choice experiment, action-at-a-distance a la Aharonov-Bohm, ...
- ▶ energy levels: quantum systems are characterized by a finite number of numbers
- ▶ entanglement
- ▶ no cloning - no broadcasting
- ▶ quantum teleportation

Wen, Tian, Niu, Phys. Scr. 2010

## Quantum mechanics: Uniqueness

- ▶ standard model of elementary particles: unique description of electrons, quarks, neutrons, protons, ...
- ▶ atoms are the same everywhere in the universe
- ▶ quantum phenomena are the same everywhere in the universe
- ▶ allows, e.g., perfect dissemination of physical units since quantum states are uniquely defined through a finite number of numbers (no machining necessary, no prototype, ...)
- ▶ beyond classical physics: spin degree of freedom
  
- ▶ technological aspect: huge potential for miniaturization

J. Norton

quantum mechanics  
"as well as"

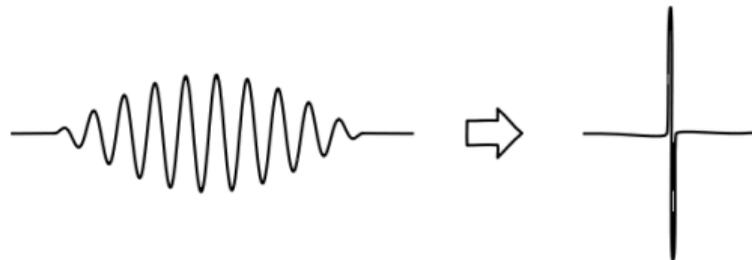

classical mechanics  
"either or"

# Quantum mechanics: Open problems

- ▶ big interpretational problem: collapse of wave function

J. Norton

- ▶ classical limit
- ▶ zero point energy and gravity

quantum mechanics  
"as well as" → classical mechanics  
"either or"

however: we can work very well without solving these problems, for practical work no solution is needed → purely interpretational problems

## Summary

# Gravitation

Basic principles of gravity (Ehlers, Pirani, Schild 1972; Will 1993)

- ▶ **Conformal structure** behavior of light rays → metric structure, locally Special Relativity

$$c = \text{const}$$

Minkowski metric  $\eta_{ab}$   
many tests  $10^{-15} - 10^{-30}$

# Gravitation

Basic principles of gravity (Ehlers, Pirani, Schild 1972; Will 1993)

- ▶ **Conformal structure** behavior of light rays  $\rightarrow$  metric structure, locally Special Relativity
- ▶ independence of  $c$  from velocity of source:  $\leq 10^{-11}$
- ▶ isotropy of  $c$ :  $\leq 10^{-17}$
- ▶ Kennedy-Thorndike:  $\leq 10^{-17}$
- ▶ time dilation:  $\leq 10^{-8}$

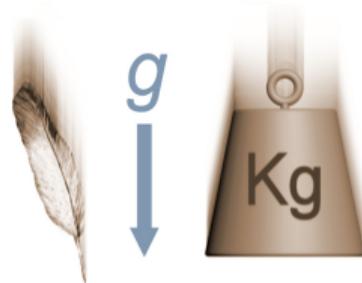

# Gravitation

Basic principles of gravity (Ehlers, Pirani, Schild 1972; Will 1993)

- ▶ **Conformal structure** behavior of light rays  $\rightarrow$  metric structure, locally Special Relativity
- ▶ **Universality of Free Fall**

there exists a coordinate system so that for all particles

$$\frac{d^2 x^\mu}{dt^2} \stackrel{*}{=} 0$$

- ▶ bulk matter, MICROSCOPE  $\eta \leq 10^{-15}$  (Touboul et al, PRL 2017)
- ▶ spin matter
- ▶ charged matter
- ▶ **anti-matter**  $\rightarrow$  Michael Doser, next talk

# Gravitation

Basic principles of gravity (Ehlers, Pirani, Schild 1972; Will 1993)

- ▶ **Conformal structure** behavior of light rays  $\rightarrow$  metric structure, locally Special Relativity
- ▶ **Universality of Free Fall**
- ▶ **Compatibility** no superluminal velocity

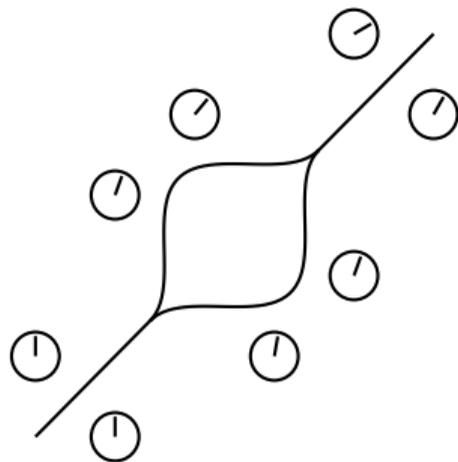

$$v < c$$

- ▶ laboratory:  $\leq 10^{-6}$
- ▶ astroparticle tests:  $\leq 10^{-21}$

# Gravitation

Basic principles of gravity (Ehlers, Pirani, Schild 1972; Will 1993)

- ▶ **Conformal structure** behavior of light rays  $\rightarrow$  metric structure, locally Special Relativity
- ▶ **Universality of Free Fall**
- ▶ **Compatibility** no superluminal velocity
- ▶ **Uniqueness of time-keeping** or uniqueness of quantum mechanics or **Local Position Invariance**

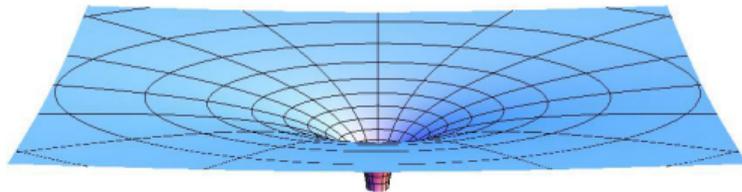

clocks may show different time (twin paradox), but same ticking rates required

many different clock tests  $\alpha \leq 10^{-4}$   
anti clocks, Galileo

# Gravitation

Basic principles of gravity (Ehlers, Pirani, Schild 1972; Will 1993)

- ▶ **Conformal structure** behavior of light rays → metric structure, locally Special Relativity
- ▶ **Universality of Free Fall**
- ▶ **Compatibility** no superluminal velocity
- ▶ **Uniqueness of time-keeping** or uniqueness of quantum mechanics or **Local Position Invariance**

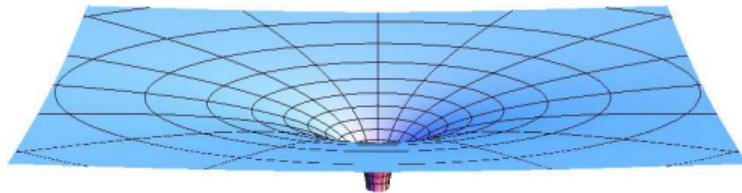

Einstein Equivalence Principle

# Gravitation

Basic principles of gravity (Ehlers, Pirani, Schild 1972; Will 1993)

- ▶ **Conformal structure** behavior of light rays → metric structure, locally Special Relativity
- ▶ **Universality of Free Fall**
- ▶ **Compatibility** no superluminal velocity
- ▶ **Uniqueness of time-keeping** or uniqueness of quantum mechanics or **Local Position Invariance**

Einstein Equivalence Principle

**Result: Gravity can be described by a pseudo-Riemannian manifold  $g_{\mu\nu}$**

applies also to fields: Maxwell, Dirac, ...

- ▶ Quantum-to-classical transition
- ▶ Towards tests of the quantum gravity domain

## Summary

## The field equations

- ▶ There is no unique physical way to derive the Einstein field equations
- ▶ Attempts: PPN formalism  
still loopholes: torsion, Finsler geometry, non-Newtonian gravity, anisotropy on the Newtonian level (SME), ...
- ▶ Guiding principle: action principle

$$S = \int R\sqrt{-g} d^4x + \int \mathcal{L}_{\text{matter}} d^4x$$

extremalization

$$R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R = \frac{8\pi G}{c^4}T_{\mu\nu}, \quad T_{\mu\nu} = \frac{1}{\sqrt{-g}} \frac{\delta \mathcal{L}_{\text{matter}}}{\delta g^{\mu\nu}}$$

- ▶ One major consequence: Black Holes

## Quantum devices / Quantum technologies

- ▶ quantum sensors - atom interferometers, clocks, SQUIDS, ...
- ▶ quantum metrology - new definition of physical units, realization via quantum systems (uniqueness)
  - ▶ clocks
  - ▶ quantum Hall effect, Josephson effect: new definition of kg
  - ▶ quantum dots for the Ampere

old definition of units:

- ▶ 1 s are 9 192 631 770 periods of the radiation of the transition between the two hyperfine levels of the  $^{133}\text{Cs}$  ground state.
- ▶ 1 m is the length traveled by light in vacuum during  $1/299\,792\,458$  of a s.
- ▶ 1 kg is equal to the mass of the prototype.
- ▶ 1 A is that current through two long thin parallel conductors 1 metre apart, which produces a force of  $2 \cdot 10^{-7}$  N/m.
- ▶ 1 K is  $1/273.16$  of the thermodynamic temperature of the triple point of water.
- ▶ 1 mol is the amount of substance of a system which contains as many elementary entities as there are atoms in 12 g of  $^{12}\text{C}$ .

## Quantum devices / Quantum technologies

- ▶ quantum sensors - atom interferometers, clocks, SQUIDS, ...
- ▶ quantum metrology - new definition of physical units, realization via quantum systems (uniqueness)
  - ▶ clocks
  - ▶ quantum Hall effect, Josephson effect: new definition of kg
  - ▶ quantum dots for the Ampere

### new definition of units

- ▶ 1 s are 9 192 631 770 periods of the radiation of the transition between the two hyperfine levels of the  $^{133}\text{Cs}$  ground state.
- ▶ 1 m is the length traveled by light in vacuum during  $1/299\,792\,458$  of a s.
- ▶ kg from definition of  $\hbar$
- ▶ A from definition of  $e$
- ▶ K from definition of  $k_{\text{B}}$
- ▶ mol from definition of  $N_{\text{A}}$
- ▶ 1 cd is the luminous intensity of a source that emits monochromatic radiation of frequency  $540 \cdot 10^{12}$  hertz and that has a radiant intensity in that direction of  $1/683$  W/steradian.

## Quantum devices / Quantum technologies

  - ▶ quantum metrology - new definition of physical units, realization via quantum systems (uniqueness)
    - ▶ clocks
    - ▶ quantum Hall effect, Josephson effect: new definition of kg
    - ▶ quantum dots for the Ampere
- realization of units
- ▶ s through atomic clock
  - ▶ m through light
  - ▶ kg through Watt balance (QHE and Josephson effect)
  - ▶ A through quantum dots
  - ▶ K through energy comparison
  - ▶ mol through silicon sphere
  - ▶ cd

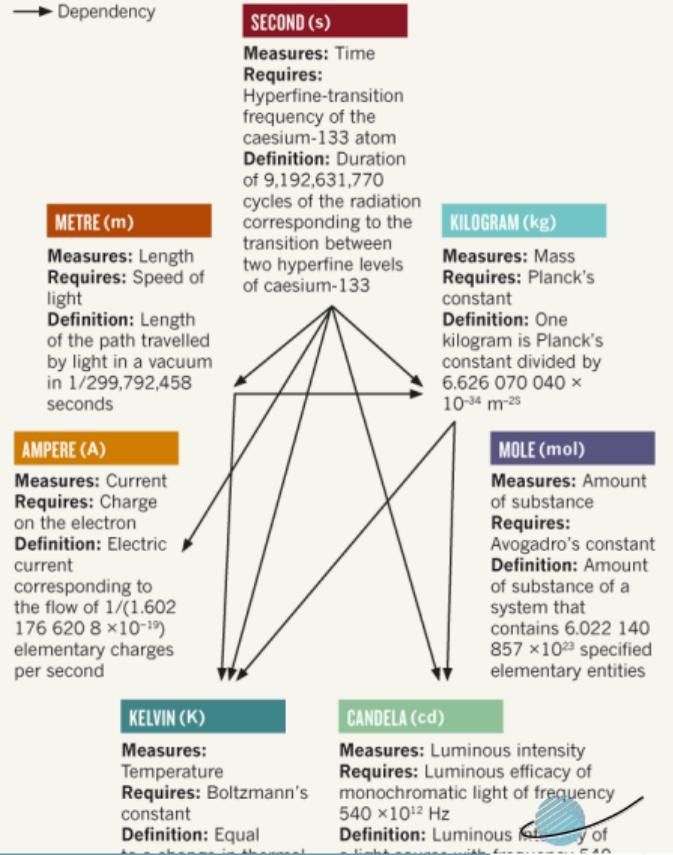

# Quantum devices / Quantum technolog

- ▶ quantum sensors - atom interferometers, clocks, SQUIDS, ...
- ▶ quantum metrology - new definition of physical units, realization via quantum systems (uniqueness)
  - ▶ clocks
  - ▶ quantum Hall effect, Josephson effect: new definition of kg
  - ▶ quantum dots for the Ampere

## ALL CHANGE

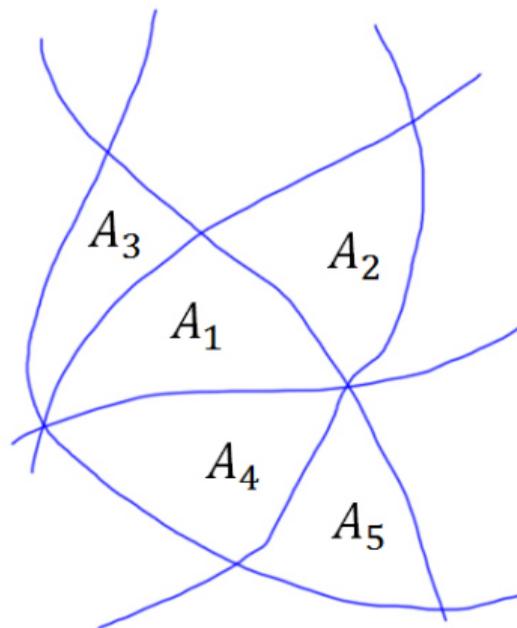

Under the revised SI system, every unit will be defined in relation to a constant, whose value will become fixed. Many of the units will be defined in relation to each other: for example, definition of the kilogram requires Planck's constant, and definitions of the second and metre.\*

→ Dependency

## Summary

# Quantum test of the Equivalence Principle

## Model

Schrödinger equation in gravitational field

$$i\hbar \frac{\partial \psi}{\partial t} = -\frac{\hbar^2}{2m} \Delta \phi + m U \psi$$

## Phase shift

For pure gravitational acceleration

- ▶ atom interferom. (Bordé 1989)

$$\delta\phi = k \cdot g T^2$$

- ▶ neutron interference (CL, GRG 1996)

$$\delta\phi = C \cdot g T^2$$

## Discussion

- ▶ **Exact quantum** result
- ▶ UFF **exactly fulfilled**
- ▶ Does **not** depend on  $\hbar$
- ▶  $\hbar$  comes in by introducing classical notions
  - ▶ height =  $h = v_z T = \frac{\hbar k}{m} T$
  - ▶ length =  $l = v_0 T$

then

$$\delta\phi = k_z g T^2 = \frac{mghl}{\hbar v_0}$$

- ▶ classical notions are operationally not realized
- ▶  $\delta\phi = k_z g T^2$  contains **experimentally given quantities** only

# Quantum test of the Equivalence Principle

## Model

Schrödinger equation in gravitational field

$$i\hbar \frac{\partial \psi}{\partial t} = -\frac{\hbar^2}{2m_i} \Delta \phi + m_g U \psi$$

## Phase shift

For pure gravitational acceleration

- ▶ atom interferom. (Bordé 1989)

$$\delta\phi = \frac{m_g}{m_i} k \cdot g T^2$$

- ▶ neutron interference (CL, GRG 1996)

$$\delta\phi = C \cdot g T^2$$

## Discussion

- ▶ **Exact quantum** result
- ▶ UFF **exactly fulfilled**
- ▶ Does **not** depend on  $\hbar$
- ▶  $\hbar$  comes in by introducing classical notions
  - ▶ height =  $h = v_z T = \frac{\hbar k}{m} T$
  - ▶ length =  $l = v_0 T$

then

$$\delta\phi = k_z g T^2 = \frac{m g h l}{\hbar v_0}$$

- ▶ classical notions are operationally not realized
- ▶  $\delta\phi = k_z g T^2$  contains **experimentally given quantities** only

## Quantum test of the Equivalence Principle

Peters, Chung & Chu, Nature 2000: quantum matter vs. classical matter,  $\eta \lesssim 10^{-9}$

Fray et al, PRL 2004: different rubidium isotopes,  $\eta \lesssim 10^{-7}$

Schlippert et al, PRL 2014: rubidium and potassium,  $\eta \lesssim 10^{-7}$

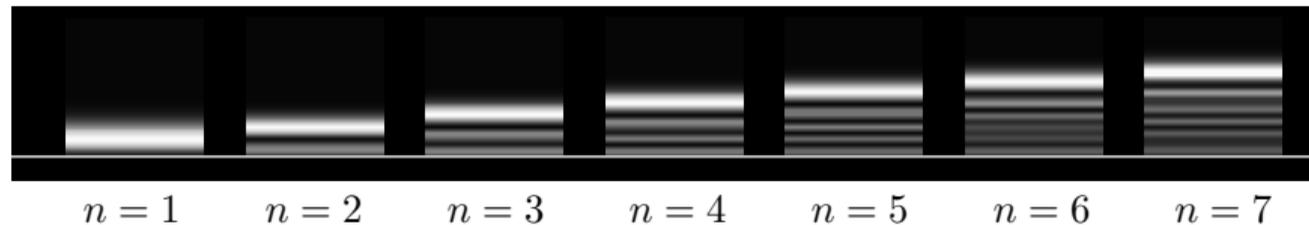

drop tower: expected  $\eta \lesssim 10^{-11}$

space: expected  $\eta \lesssim 10^{-15}$

- ▶ can be used for an **operational definition of the equivalence principle** in the **quantum domain**, even in curved space–time (C.L., GRG 1996)
- ▶ it can be shown that this operational definition is equivalent to the **minimal coupling** procedure (C.L., APP 1997)

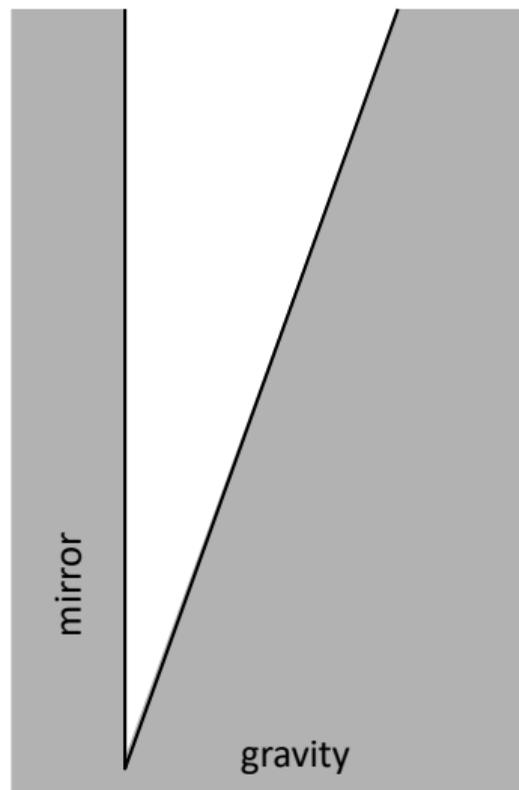

## BEC in GOST

- ▶ BEC in gravito-optical surface trap (GOST)
- ▶ boundary conditions  $\psi = 0$  for  $z = 0$
- ▶ spacing between nodes depends on gravitational acceleration

### Quantum tests

- ▶ Two generic tests
- ▶ **General quests and approaches**
- ▶ Test of Gravitational redshift
- ▶ Atom interferometry
- ▶ Quantum-to-classical transition
- ▶ Towards tests of the quantum gravity domain

## Summary

# General quests related to the quantum – gravity regime

- ▶ **Test of quantum principles**
  - ▶ study of the measurement process
  - ▶ testing linearity of quantum mechanics
  - ▶ search for fundamental decoherence
  - ▶ measuring wave packet spreading
  - ▶ exploring the quantum degrees of freedom (spin)
- ▶ **Quantum test of gravity principles**
  - ▶ quantum test of UFF
  - ▶ quantum test of UFF with atoms with spin
  - ▶ test of UGR
  - ▶ test of UFF and UGR for gravitomagnetism
  - ▶ testing all GR effects
- ▶ **Combined tests (towards quantum gravity)**
  - ▶ entanglement in gravitational fields
  - ▶ investigation of self gravity
  - ▶ test of semiclassical Einstein equations
  - ▶ search for modified dispersion relation

# General quests related to the quantum – gravity regime

## ▶ Test of quantum principles

- ▶ study of the measurement process
- ▶ testing linearity of quantum mechanics
- ▶ search for fundamental decoherence
- ▶ measuring wave packet spreading
- ▶ exploring the quantum degrees of freedom (spin)

## ▶ Quantum test of gravity principles

- ▶ quantum test of UFF
- ▶ quantum test of UFF with atoms with spin
- ▶ test of UGR
- ▶ test of UFF and UGR for gravitomagnetism
- ▶ testing all GR effects

## ▶ Combined tests (towards quantum gravity)

- ▶ entanglement in gravitational fields
- ▶ investigation of self gravity
- ▶ test of semiclassical Einstein equations
- ▶ search for modified dispersion relation

most of the tests profit from

- ▶ large potential differences
- ▶ long distances
- ▶ long free fall time – long integration/accumulation time
- ▶ quiet environment

## Summary

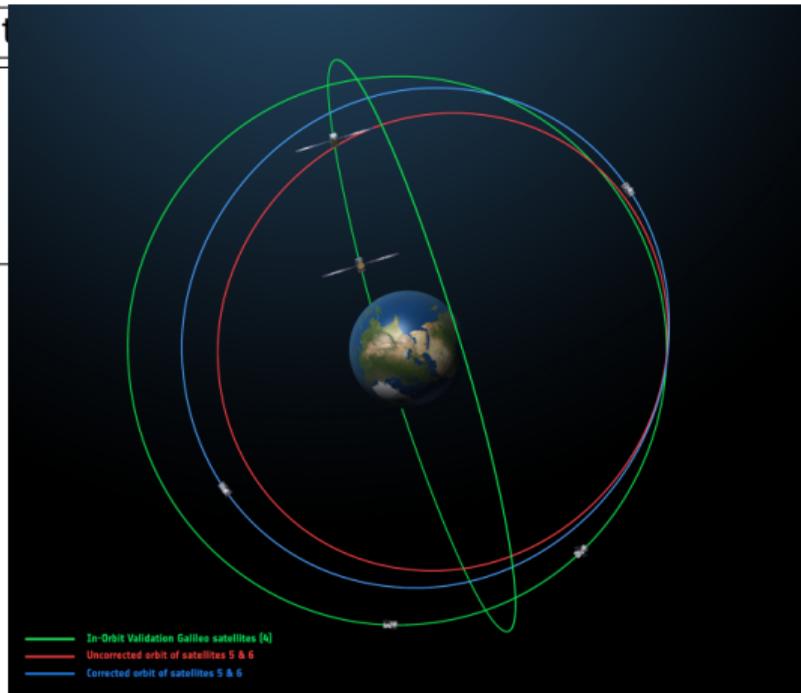

## Galileo 5 and 6

	after launch	after correction	target orbit
$e$	0.233	0.1561	$\sim 0$
$a$ [km]	26,192	27,977	29,900
$i$	49.774	49.7212	55
$r_a - r_p$ [km]	11,681	8,730	$\sim 0$

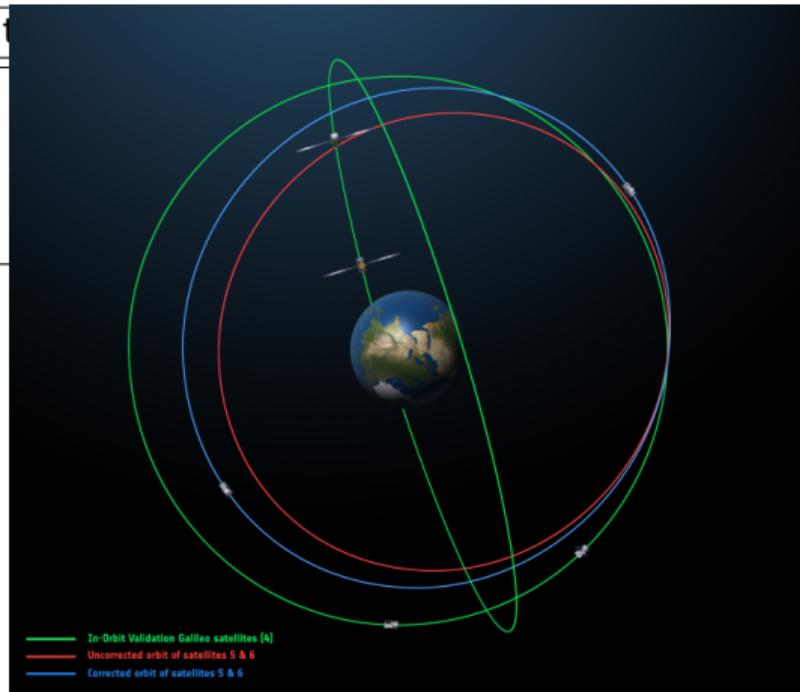

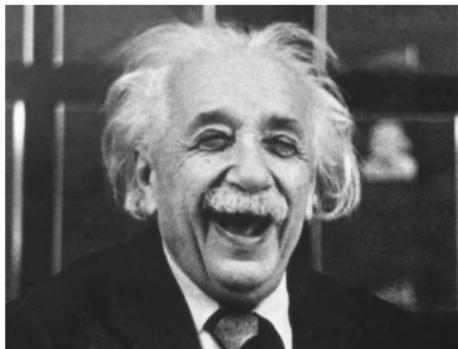

## Galileo 5 and 6

	after launch	after correction	t
$e$	0.233	0.1561	
$a$ [km]	26,192	27,977	
$i$	49.774	49.7212	
$r_a - r_p$ [km]	11,681	8,730	

## Galileo 5 and 6

	after launch	after correction	t
$e$	0.233	0.1561	
$a$ [km]	26,192	27,977	
$i$	49.774	49.7212	
$r_a - r_p$ [km]	11,681	8,730	

# Galileo clocks and redshift

## Galileo clocks

- ▶ passive Hydrogen maser PHM and Rubidium clock RAFS
- ▶ stability:  $\sigma_{\text{HM}} = 3 \cdot 10^{-15}$  and  $\sigma_{\text{RAFS}} = 2 \cdot 10^{-14}$  at time scale of one orbit

## Redshift

- ▶ redshift between perigeum and apogeum

$$\frac{\Delta\nu}{\nu} = (1 + \alpha) \frac{GM}{c^2} \left( \frac{1}{r_p} - \frac{1}{r_a} \right) \Rightarrow \Delta t = 2(1 + \alpha) \frac{\vec{r} \cdot \vec{v}}{c^2}$$

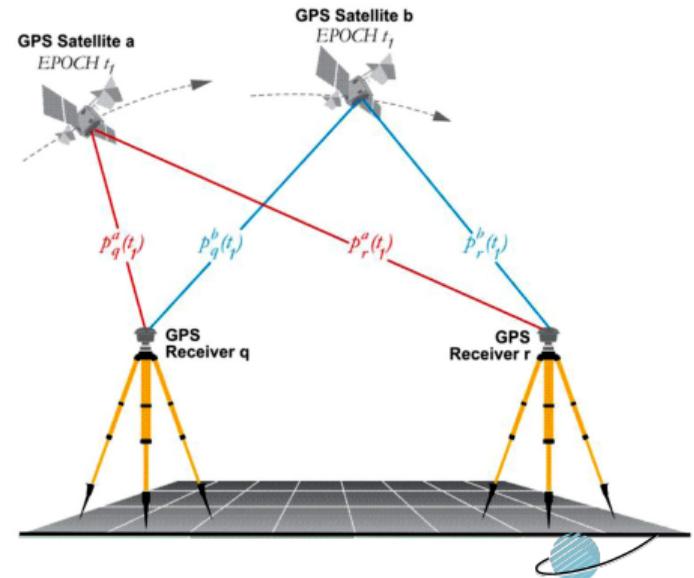

- ▶ experimental parameter:  $\alpha$
- ▶ with the maximum difference of radius of  $\sim 8730$  km one gets the maximum redshift  $\frac{\Delta\nu}{\nu} \approx 5 \cdot 10^{-11}$
- ▶ corresponds to 370 ns time gain per revolution (nominal  $\sim 0.5$  ns)

# Clock data

Pseudo range for measured times

$$P_{r,f}^s(t) = \|\vec{r}_r(t) - \vec{r}^s(t - T)\| + c(\Delta t_r(t) - \Delta t^s(t - T)) + c(d_{r,f}(t) - d_r^s(t - T)) + I_{r,f}^s + T_{r,f}^s - m_{r,P,f}^s(t) + \epsilon_{r,P,f}^s(t)$$

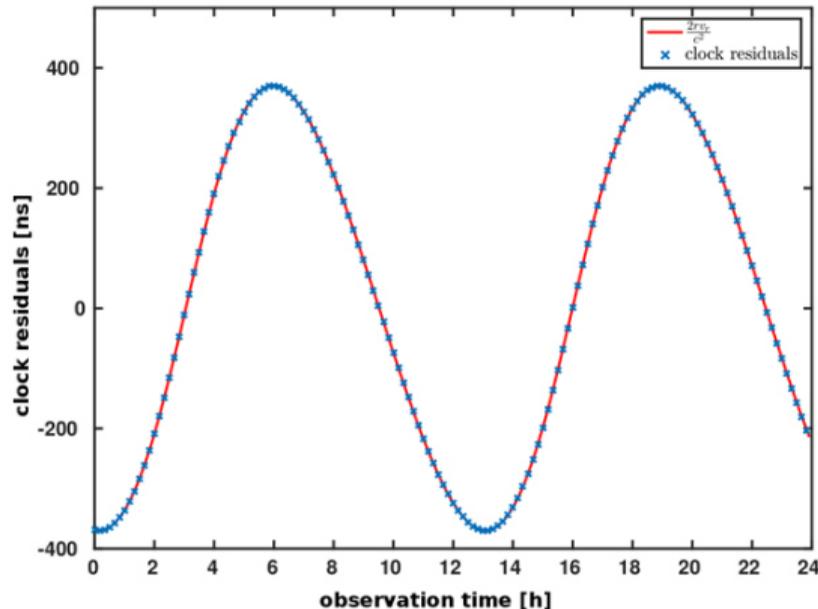

- ▶ Measurement of signal travel times = pseudo range
- ▶ one has to determine satellite clock corrections  $\Delta t^s$
- ▶ clock corrections depend, among others, on orbit information: 30 cm  $\rightarrow$  1 ns

# Data without relativistic correction

GPS week 1870; day 0

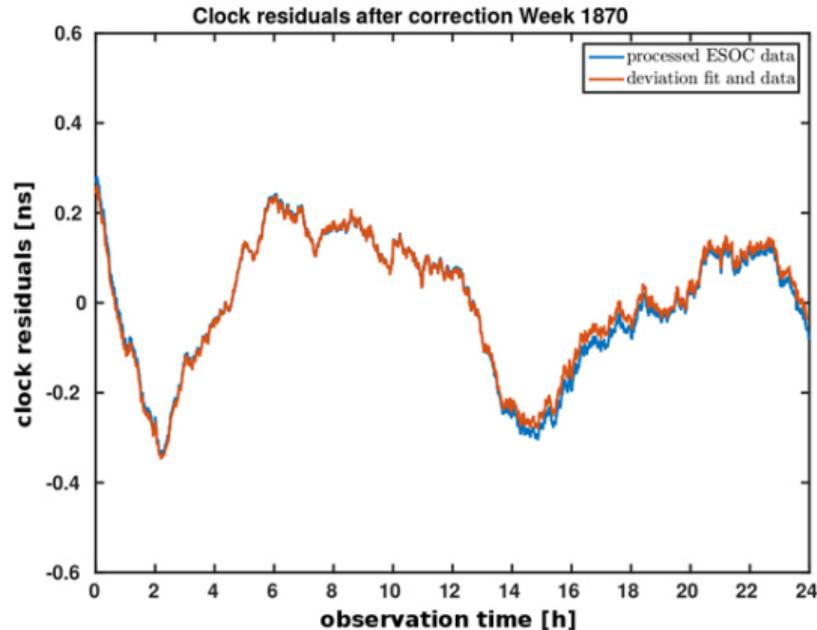

- ▶ relativistic effects included
- ▶ gravitational redshift + Doppler

$$\Delta t = 2 \frac{\vec{r} \cdot \vec{v}}{c^2}$$

- ▶  $\sim 370$  ns modulation amplitude

# Data without relativistic “correction”

GPS week 1870; day 0

- ▶ relativistic effects modeled and removed by ZARM
- ▶ comparison to final ESOC products
- ▶ provides a check of basic common understanding
- ▶ variations of  $\sim 0.5$  ns due to systematic effects

## Least squares fit model

$$S = \sum_{i=1}^n \left( \epsilon_i - \alpha \left( \int_{\text{path}} \left( \frac{GM_{\oplus}}{rc^2} \left( 1 - \frac{J_2 a_{\oplus}^2}{2r^2} \left( \frac{3z^2}{r^2} - 1 \right) \right) + \frac{v^2}{2c^2} \right) dt_i \right) - a_0 - a_1 t_i \right)$$

with

$\epsilon_i$  clock residuals

$J_2$  axially symmetric quadruple moment of Earth (flattening)

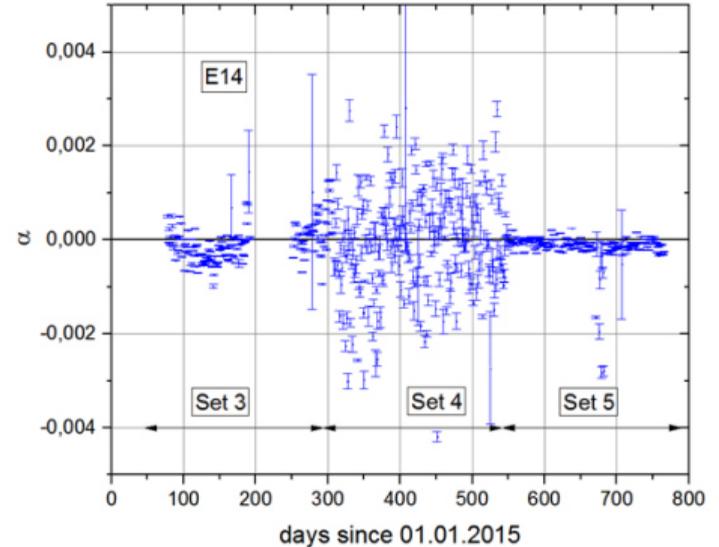

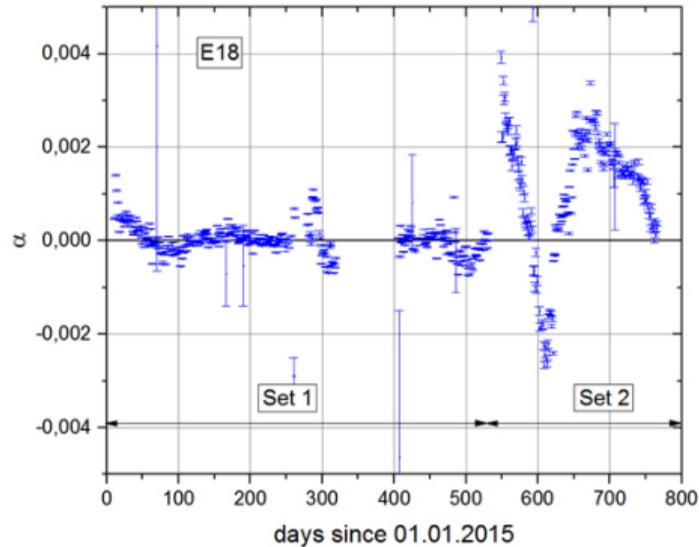

$a_0$  clock offset parameter

$a_1$  clock drift parameter

to be determined  $\alpha$

working on Bayesian data analysis

# Preliminary statistics on all $\alpha$ results

- ▶ two years of data: 585 days, resp. 610 days
- ▶ evaluation ongoing ...

## Partial results

set	$\alpha \cdot 10^{-4}$	$\sigma \cdot 10^{-4}$	$n$	outliers	gap days	span [days]
set 1	0.14	2.89	405	15	101	521
set 2	11.20	13.27	205	2	11	218
set 3	-0.75	3.92	163	9	59	231
set 4	-0.43	10.75	232	9	0	241
set 5	-0.97	1.12	190	12	15	217

## Systematics: approach

- ▶ Temperature, magnetic fields, attitude as discussed in TN1 not yet considered due to lack of data
- ▶ Focus on solar radiation pressure
  - ▶ correlate with sun elevation, derive model
  - ▶ model SRP a priori from geometric satellite model
  - ▶ use SLR data from ILRS campaign and reprocess products
- ▶ Look for other correlations with readily accessible data (orbit parameters, eclipse phases,...)

## Result

Improvement of GP-A result by a factor of 4 ([Herrmann et al, PRL 2018](#))

conservative assumptions - colleagues from SYRTE get an improvement by a factor of 5 ([Delva et al, PRL 2018](#)) - ongoing discussion

**Figure 3.** Source scheme to prepare  $4 \times 10^5$  quantum degenerate atoms in 1.6 s. Five absorption images of the atoms illustrate the steps involved (①–⑤). The chip structures used as well as the magnetic field calculated with a model of the wire structures are shown below the images. (The trap bottom has been subtracted for the magnetic traps.) All chip configurations are used in conjunction with external bias fields. ① After 500 ms  $1 \times 10^5$  atoms are loaded into a MOT generated by the mesoscopic U structure. ② The atoms are compressed and molasses cooled to  $20 \mu\text{K}$ . ③  $2 \times 10^5$  atoms can be captured in the initial magnetic trap, formed by the mesoscopic H and a base chip Z structure. ④ To improve the evaporation efficiency, the trap is compressed by switching from the mesoscopic H structure to a science chip Z structure, while keeping the base chip Z switched on. ⑤ During evaporation to BEC the trap is decompressed once to avoid three-body collisions.

## Summary

## Summary MAQRO

MAQRO = Macroscopic Quantum Resonators  
= WAX + DECIDE + CASE

WAX = Wave function Expansion

DECIDE = Decoherence Interference Experiment

CASE = Comparative Acceleration Sensing Experiment

### Science cases

**WAX:** searches for fundamental decoherence by means of wave packet spreading

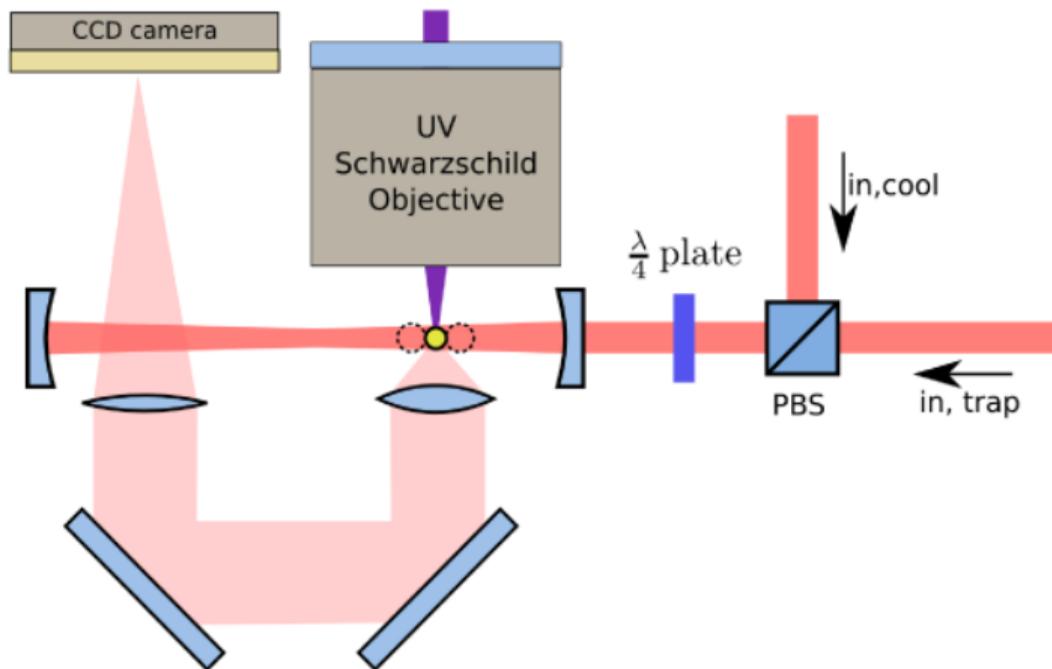

**DECIDE:** test the predictions of quantum theory for quantum superpositions of macroscopic objects containing more than  $10^8$  atoms

**CASE:** demonstrate the performance of a novel type of inertial sensor based on optically trapped microspheres

## MAQRO Science cases

- ▶ will gravitation lead to modifications of quantum physics for very massive objects? [self gravity at quantum level?]
- ▶ are macroscopic quantum superpositions at all possible or are there yet unknown decoherence mechanisms? [quantum to classical transition]
- ▶ the short de-Broglie wavelength of massive particles can be used for high sensitivity matter wave interferometry with practical applications [practical application]

# Setup of MAQRO/DECIDE

# Outline

## Quantum mechanics

- ▶ The foundations

### Quantum tests

- ▶ Two generic tests
- ▶ General quests and approaches
- ▶ Test of Gravitational redshift
- ▶ Atom interferometry
- ▶ Quantum-to-classical transition
- ▶ Towards tests of the quantum gravity domain

## Summary

# Decoherence

## The model

- ▶ model

$$H = \frac{1}{2m} (\delta^{ij} + \tilde{\alpha}^{ij} + \gamma^{ij}(t)) p_i p_j$$

- ▶ discuss now the influence of  $\gamma^{ij}$  and neglect  $\tilde{\alpha}^{ij}$
- ▶ neglect small  $x$ -dependence

## Noise model

- ▶ isotropic fluctuations  $\gamma^{ij}(t) = \sigma \delta^{ij} \xi(t)$
- ▶ white noise  $\langle \xi(t) \rangle = 0, \langle \xi(t) \xi(t') \rangle = \delta(t - t')$
- ▶  $\dim \sigma^2 = \text{time} = \tau_c$

- ▶ practically no influence from colored noise
- ▶  $\gamma^{ij}(t)$  random process

# Decoherence

## Master equation

- ▶ stochastic Schrödinger equation in interaction picture

$$i\hbar \frac{d}{dt} |\tilde{\psi}\rangle = \tilde{H}_\gamma |\tilde{\psi}\rangle, \quad \tilde{H} = e^{\frac{i}{\hbar} H_0 t} H_\gamma e^{-\frac{i}{\hbar} H_0 t}$$

with random Hamiltonian  $\tilde{H}_\gamma$  with  $\langle \tilde{H}_\gamma \rangle_t = 0$

- ▶ averaging over fluctuations  $\Rightarrow$  averaged density matrix

$$\tilde{\rho}(t) = \langle | \tilde{\psi} \rangle \langle \tilde{\psi} | \rangle$$

- ▶ master equation for averaged density matrix to second order in the fluctuations

$$i\hbar \frac{d}{dt} \tilde{\rho} = -\frac{i}{\hbar} \int_0^t \langle [ \tilde{H}_\gamma(t), [ \tilde{H}_\gamma(t'), \tilde{\rho}(t) ] ] \rangle dt'$$

# Decoherence

## Markovian master equation

- ▶ in Schrödinger picture

$$i\hbar \frac{d}{dt} \rho(t) = [H_0, \rho(t)] + i\hbar (\mathcal{D}\rho)(t)$$

with

$$(\mathcal{D}\rho)(t) = -\frac{1}{2}[V, [V, \rho(t)]] \quad \text{with} \quad V = \frac{\sqrt{\tau_c}}{\hbar} \frac{p^2}{2m}$$

- ▶ master equation is in Lindblad form  $\Rightarrow$  defines a completely positive quantum-dynamical semigroup
- ▶ energy is conserved
  
- ▶  $\mathcal{D}$  is the dissipator

# Decoherence

## Decoherence time

- ▶ solution of master equation in momentum space

$$\rho(p, p', t) = \exp\left(-\frac{i}{\hbar}\Delta Et - \frac{(\Delta E)^2\tau_c}{2\hbar^2}t\right) \rho(p, p', 0)$$

decoherence time

$$\tau_D = \frac{2\hbar^2}{(\Delta E)^2\tau_c} = 2\left(\frac{\hbar}{\Delta E\tau_c}\right)^2 \tau_c$$

- ▶ for  $\tau_c = t_{\text{Planck}}$

$$\tau_D = \frac{10^{13} \text{ s}}{(\Delta E/\text{eV})^2}$$

- ▶ too large for being observable
- ▶ may change for BECs

(Breuer, Göklü & C.J. 2009)

ZARM

# Spreading of wave packets

## Model

- ▶ dynamics: same model as above

$$H = H_0 + V(x), \quad V(x) = \mathcal{O}(\hbar\partial\partial\hbar, \partial\hbar\partial\hbar)$$

- ▶  $V$  is Gaussian random function

$$\langle V(x) \rangle = 0, \quad \langle V(x), V(x') \rangle = V_0^2 \delta(t - t') g(x - x')$$

## The spreading

for Gaussian correlation and Gaussian initial wave packet

$$\langle x^2(t) \rangle = \underbrace{\sigma^2 + \frac{\hbar^2}{4m^2\sigma^2(0)}t^2}_{\text{free evolution}} + \underbrace{\frac{5V_0^2}{\sqrt{2\pi m^2 a^7}}t^3}_{\text{superdiffusion}}$$

## Self gravity

Non-relativistic self gravity (e.g. [Giulini & Grossardt](#))

$$i\hbar\dot{\psi} = -\frac{\hbar^2}{2m}\Delta\phi + mU\psi, \quad \Delta U = 4\pi G\bar{\psi}\psi$$

Relativistic self gravity (Boson stars, [Kunz et al](#))

$$0 = \psi + m^2\psi + V(\psi), \quad R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R = \kappa T_{\mu\nu}(\psi)$$

- ▶ Experimental realization of Boson stars (needs high density)
  - ▶ Spherically symmetric configurations
  - ▶ Rotating configurations
- ▶ Interference of two self-gravitating objects

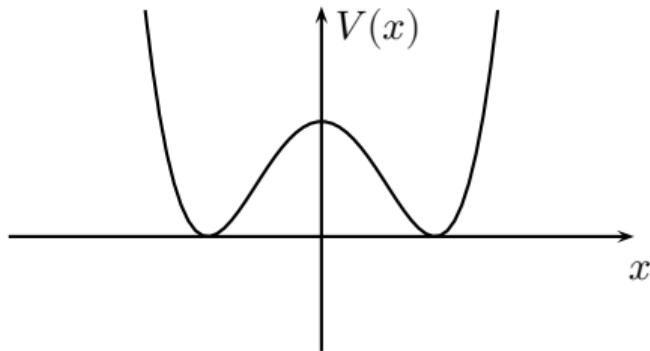

# Semiclassical Einstein equations

Semiclassical Einstein equations

$$R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R = \kappa\langle\psi | \hat{T}_{\mu\nu} | \psi\rangle$$

Symmetrized and antisymmetrized states in double-well potential

$$|\psi_{\pm}\rangle = \frac{1}{\sqrt{2}}(|\psi_1\rangle \pm |\psi_2\rangle)$$

- ▶ Symmetrized and antisymmetrized states have same spatial density  $\| |\psi_+\rangle \| = \| |\psi_-\rangle \|$
- ▶ Symmetrized and antisymmetrized states create different gravitational field:  
 $\langle\psi_+ | \hat{T}_{\mu\nu} | \psi_+\rangle \neq \langle\psi_- | \hat{T}_{\mu\nu} | \psi_-\rangle$
- ▶ Gravitational field can be probed by slow atoms ( $v \sim 1 \text{ mm/s}$ )

(Peres & Lindner, PRA 2004)

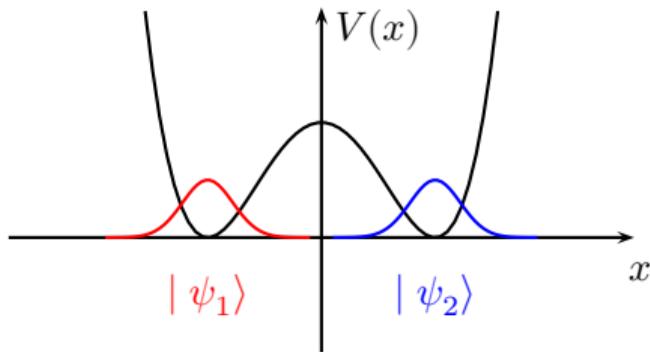

# Semiclassical Einstein equations

Semiclassical Einstein equations

$$R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R = \kappa\langle\psi | \hat{T}_{\mu\nu} | \psi\rangle$$

Symmetrized and antisymmetrized states in double-well potential

$$|\psi_{\pm}\rangle = \frac{1}{\sqrt{2}}(|\psi_1\rangle \pm |\psi_2\rangle)$$

- ▶ Symmetrized and antisymmetrized states have same spatial density  $\| |\psi_+\rangle \| = \| |\psi_-\rangle \|$
- ▶ Symmetrized and antisymmetrized states create different gravitational field:  
 $\langle\psi_+ | \hat{T}_{\mu\nu} | \psi_+\rangle \neq \langle\psi_- | \hat{T}_{\mu\nu} | \psi_-\rangle$
- ▶ Gravitational field can be probed by slow atoms ( $v \sim 1 \text{ mm/s}$ )

(Peres & Lindner, PRA 2004)

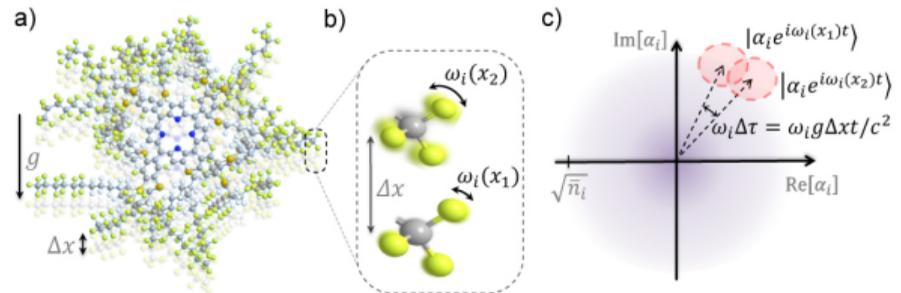

# Outlook - further issues

## Quantum time

- ▶ Is the Compton frequency of an atom a clock? “A rock as a clock” (Müller, Peters, Chu, Nature 2010)
