Continuous
Coupling

Bang-Bang
control

Comparison

- 1 Two techniques to control the evolution of a quantum system
 - Strong Continuous Coupling
 - Bang-bang evolution
- 2 Comparing the two paradigms

Strong continuous coupling

\mathcal{H} finite dimensional Hilbert space.

H be the Hamiltonian of the system

Continuous
Coupling

Bang-Bang
control

Comparison

Strong continuous coupling

\mathcal{H} finite dimensional Hilbert space.

H be the Hamiltonian of the system
Continuous coupling:

$$H_K = H + KV$$

Evolution operator: $U_K(t) = e^{-it(H+KV)}$

Control potential

$$V = \sum_{\mu} \lambda_{\mu} P_{\mu}$$

Strong continuous coupling

\mathcal{H} finite dimensional Hilbert space.

H be the Hamiltonian of the system
Continuous coupling:

$$H_K = H + KV$$

Evolution operator: $U_K(t) = e^{-it(H+KV)}$

Control potential

$$V = \sum_{\mu} \lambda_{\mu} P_{\mu}$$

Strong Continuous Coupling ($K \rightarrow \infty$)

Continuous
Coupling

Bang-Bang
control

Comparison

Strong continuous coupling

\mathcal{H} finite dimensional Hilbert space.

H be the Hamiltonian of the system
Continuous coupling:

$$H_K = H + KV$$

Evolution operator: $U_K(t) = e^{-it(H+KV)}$

Strong Continuous Coupling ($K \rightarrow \infty$)

$$U_K(t) = e^{-iKVt} e^{-iH_Z t} + O\left(\frac{1}{K}\right)$$

Control potential

$$V = \sum_{\mu} \lambda_{\mu} P_{\mu}$$

Zeno Hamiltonian:

$$H_Z = \sum_{\mu} P_{\mu} H P_{\mu}$$

Strong continuous coupling

\mathcal{H} finite dimensional Hilbert space.

H be the Hamiltonian of the system
Continuous coupling:

$$H_K = H + KV$$

Evolution operator: $U_K(t) = e^{-it(H+KV)}$

Strong Continuous Coupling ($K \rightarrow \infty$)

$$U_K(t) = e^{-iKVt} e^{-iH_Z t} + O\left(\frac{1}{K}\right)$$

The total Hilbert space is partitioned into superselection sectors:

$$\mathcal{H} = \bigoplus_{\mu} \mathcal{H}_{P_{\mu}}, \quad \mathcal{H}_{P_{\mu}} = P_{\mu} \mathcal{H}$$

Control potential

$$V = \sum_{\mu} \lambda_{\mu} P_{\mu}$$

Zeno Hamiltonian:

$$H_Z = \sum_{\mu} P_{\mu} H P_{\mu}$$

A brief detour: the Adiabatic Theorem

Time-dependent Schrödinger equation:

$$\begin{cases} i \frac{d\mathcal{U}}{dt} = \mathcal{H}(t)\mathcal{U}(t), \\ \mathcal{U}(0) = \mathbb{I} \end{cases} \quad t \in [0, T]$$

Continuous
Coupling

Bang-Bang
control

Comparison

A brief detour: the Adiabatic Theorem

Time-dependent Schrödinger equation:

$$\begin{cases} i \frac{d\mathcal{U}}{dt} = \mathcal{H}(t)\mathcal{U}(t), & t \in [0, T] \\ \mathcal{U}(0) = \mathbb{I} \end{cases}$$

What happens when the variation of $\mathcal{H}(t)$ is made VERY slow?

Continuous
Coupling

Bang-Bang
control

Comparison

A brief detour: the Adiabatic Theorem

Time-dependent Schrödinger equation:

$$\begin{cases} i \frac{d\mathcal{U}}{dt} = \mathcal{H}(t)\mathcal{U}(t), & t \in [0, T] \\ \mathcal{U}(0) = \mathbb{I} \end{cases}$$

What happens when the variation of $\mathcal{H}(t)$ is made VERY slow?

Introducing the rescaled time $s = t/T \in [0, 1]$:

Continuous
Coupling

Bang-Bang
control

Comparison

A brief detour: the Adiabatic Theorem

Continuous
Coupling

Bang-Bang
control

Comparison

Time-dependent Schrödinger equation:

$$\begin{cases} i \frac{d\mathcal{U}}{dt} = \mathcal{H}(t)\mathcal{U}(t), & t \in [0, T] \\ \mathcal{U}(0) = \mathbb{I} \end{cases}$$

What happens when the variation of $\mathcal{H}(t)$ is made VERY slow?

Introducing the rescaled time $s = t/T \in [0, 1]$:

Rescaled Schrödinger equation

$$i \frac{dU_T}{ds} = TH(s)U_T(s), \quad U_T(0) = 1$$

Where:

$$\begin{aligned} H(s) &\equiv \mathcal{H}(sT) \\ U_T(s) &\equiv \mathcal{U}(sT) \end{aligned}$$

A brief detour: the Adiabatic Theorem

Continuous Coupling

Bang-Bang control

Comparison

Time-dependent Schrödinger equation:

$$\begin{cases} i \frac{d\mathcal{U}}{dt} = \mathcal{H}(t)\mathcal{U}(t), & t \in [0, T] \\ \mathcal{U}(0) = \mathbb{I} \end{cases}$$

What happens when the variation of $\mathcal{H}(t)$ is made VERY slow?

Introducing the rescaled time $s = t/T \in [0, 1]$:

Rescaled Schrödinger equation

$$i \frac{dU_T}{ds} = TH(s)U_T(s), \quad U_T(0) = 1$$

Instantaneous eigenprojection:

$$H(s)P(s) = \lambda(s)P(s)$$

Where:

$$\begin{aligned} H(s) &\equiv \mathcal{H}(sT) \\ U_T(s) &\equiv \mathcal{U}(sT) \end{aligned}$$

A brief detour: the Adiabatic Theorem

Continuous Coupling

Bang-Bang control

Comparison

Time-dependent Schrödinger equation:

$$\begin{cases} i \frac{d\mathcal{U}}{dt} = \mathcal{H}(t)\mathcal{U}(t), & t \in [0, T] \\ \mathcal{U}(0) = \mathbb{I} \end{cases}$$

What happens when the variation of $\mathcal{H}(t)$ is made VERY slow?

Introducing the rescaled time $s = t/T \in [0, 1]$:

Rescaled Schrödinger equation

$$i \frac{dU_T}{ds} = TH(s)U_T(s), \quad U_T(0) = 1$$

Instantaneous eigenprojection:

$$H(s)P(s) = \lambda(s)P(s)$$

Assumptions:

- $\lambda(s)$ continuous;
- $P(s) \in C^2([0, 1])$

Where:

$$\begin{aligned} H(s) &\equiv \mathcal{H}(sT) \\ U_T(s) &\equiv \mathcal{U}(sT) \end{aligned}$$

A brief detour: the Adiabatic Theorem

Continuous Coupling

Bang-Bang control

Comparison

Time-dependent Schrödinger equation:

$$\begin{cases} i \frac{d\mathcal{U}}{dt} = \mathcal{H}(t)\mathcal{U}(t), \\ \mathcal{U}(0) = \mathbb{I} \end{cases} \quad t \in [0, T]$$

What happens when the variation of $\mathcal{H}(t)$ is made VERY slow?

Introducing the rescaled time $s = t/T \in [0, 1]$:

Rescaled Schrödinger equation

$$i \frac{dU_T}{ds} = TH(s)U_T(s), \quad U_T(0) = 1$$

Instantaneous eigenprojection:

$$H(s)P(s) = \lambda(s)P(s)$$

Assumptions:

- $\lambda(s)$ continuous;
- $P(s) \in C^2([0, 1])$

Where:

$$\begin{aligned} H(s) &\equiv \mathcal{H}(sT) \\ U_T(s) &\equiv \mathcal{U}(sT) \end{aligned}$$

Adiabatic limit ($T \rightarrow \infty$)

$$U_T(s)P(0) = e^{-iT \int_0^s \lambda(\sigma) d\sigma} U(s)P(0) + O\left(\frac{1}{T}\right)$$

Intertwining property: $P(s)U(s) = U(s)P(0)$

The strong coupling limit: a sketch of the proof

The evolution $U_K(t)$ generated by the continuous coupling satisfies the equation:

$$i \frac{dU_K}{dt} = (H + KV)U_K(t)$$

Continuous
Coupling

Bang-Bang
control

Comparison

The strong coupling limit: a sketch of the proof

The evolution $U_K(t)$ generated by the continuous coupling satisfies the equation:

$$i \frac{dU_K}{dt} = (H + KV)U_K(t)$$

Going to the interaction picture: $U'_K(t) = e^{itH} U_K(t)$, $V'(t) = e^{itH} V e^{-itH}$

Interaction Picture

$$i \frac{dU'_K}{dt} = KV'(t)U'_K(t)$$

Continuous
Coupling

Bang-Bang
control

Comparison

The strong coupling limit: a sketch of the proof

The evolution $U_K(t)$ generated by the continuous coupling satisfies the equation:

$$i \frac{dU_K}{dt} = (H + KV)U_K(t)$$

Going to the interaction picture: $U'_K(t) = e^{itH} U_K(t)$, $V^I(t) = e^{itH} V e^{-itH}$

Interaction Picture

$$i \frac{dU'_K}{dt} = KV^I(t)U'_K(t)$$

Rescaled Schrödinger equation

$$i \frac{dU_T}{ds} = TH(s)U_T(s)$$

$$s \leftrightarrow t \quad T \leftrightarrow K \quad H(s) \leftrightarrow V^I(t) \quad P(s) \leftrightarrow P_\mu(t)$$

Continuous
Coupling

Bang-Bang
control

Comparison

The strong coupling limit: a sketch of the proof

The evolution $U_K(t)$ generated by the continuous coupling satisfies the equation:

$$i \frac{dU_K}{dt} = (H + KV)U_K(t)$$

Going to the interaction picture: $U'_K(t) = e^{itH} U_K(t)$, $V^I(t) = e^{itH} V e^{-itH}$

Interaction Picture

$$i \frac{dU'_K}{dt} = KV^I(t)U'_K(t)$$

Rescaled Schrödinger equation

$$i \frac{dU_T}{ds} = TH(s)U_T(s)$$

$$s \leftrightarrow t \quad T \leftrightarrow K \quad H(s) \leftrightarrow V^I(t) \quad P(s) \leftrightarrow P_\mu(t)$$

$$V^I(t) = \sum_\mu \lambda_\mu P_\mu(t)$$

- ✓ λ_μ constant
- ✓ $P_\mu(t) = e^{itH} P_\mu e^{-itH}$
analytic

Continuous
Coupling

Bang-Bang
control

Comparison

The strong coupling limit: a sketch of the proof

The evolution $U_K(t)$ generated by the continuous coupling satisfies the equation:

$$i \frac{dU_K}{dt} = (H + KV)U_K(t)$$

Going to the interaction picture: $U_K^I(t) = e^{itH} U_K(t)$, $V^I(t) = e^{itH} V e^{-itH}$

Interaction Picture

$$i \frac{dU_K^I}{dt} = KV^I(t)U_K^I(t)$$

Rescaled Schrödinger equation

$$i \frac{dU_T}{ds} = TH(s)U_T(s)$$

$$s \leftrightarrow t \quad T \leftrightarrow K \quad H(s) \leftrightarrow V^I(t) \quad P(s) \leftrightarrow P_\mu(t)$$

Dynamical decoupling

Pulsed evolution:

Kicking Unitary

$$U_{\text{kick}} = \sum_{\mu} e^{-i\lambda_{\mu}} P_{\mu}$$

Continuous
Coupling

Bang-Bang
control

Comparison

Dynamical decoupling

Pulsed evolution:

Idea behind the method: suppose that $U_{\text{kick}}^m = \mathbb{I}$ for some $m \in \mathbb{N}$

Kicking Unitary

$$U_{\text{kick}} = \sum_{\mu} e^{-i\lambda_{\mu}} P_{\mu}$$

Continuous
Coupling

Bang-Bang
control

Comparison

Dynamical decoupling

Pulsed evolution:

Kicking Unitary

$$U_{\text{kick}} = \sum_{\mu} e^{-i\lambda_{\mu}} P_{\mu}$$

Idea behind the method: suppose that $U_{\text{kick}}^m = \mathbb{I}$ for some $m \in \mathbb{N}$

Then, for $n = km$:

$$\begin{aligned} U_n(t) &= \underbrace{\left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \cdots \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right)}_{n \text{ times}} \\ &= U_{\text{kick}}^n U_{\text{kick}}^{\dagger n-1} e^{-i\frac{t}{n}H} U_{\text{kick}}^{n-1} \cdots U_{\text{kick}}^{\dagger} e^{-i\frac{t}{n}H} U_{\text{kick}} e^{-i\frac{t}{n}H} \\ &= e^{-i\frac{t}{n}H} H_{n-1} \cdots e^{-i\frac{t}{n}H} H_1 e^{-i\frac{t}{n}H} H_0 \end{aligned}$$

Dynamical decoupling

Pulsed evolution:

Kicking Unitary

$$U_{\text{kick}} = \sum_{\mu} e^{-i\lambda_{\mu}} P_{\mu}$$

Idea behind the method: suppose that $U_{\text{kick}}^m = \mathbb{I}$ for some $m \in \mathbb{N}$

Then, for $n = km$:

$$\begin{aligned}
 U_n(t) &= \underbrace{\left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \dots \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right)}_{n \text{ times}} \\
 &= U_{\text{kick}}^n U_{\text{kick}}^{\dagger n-1} e^{-i\frac{t}{n}H} U_{\text{kick}}^{n-1} \dots U_{\text{kick}}^{\dagger} e^{-i\frac{t}{n}H} U_{\text{kick}} e^{-i\frac{t}{n}H} \\
 &= e^{-i\frac{t}{n}H_{n-1}} \dots e^{-i\frac{t}{n}H_1} e^{-i\frac{t}{n}H_0}
 \end{aligned}$$

Dynamical decoupling

Pulsed evolution:

Kicking Unitary

$$U_{\text{kick}} = \sum_{\mu} e^{-i\lambda_{\mu}} P_{\mu}$$

Idea behind the method: suppose that $U_{\text{kick}}^m = \mathbb{I}$ for some $m \in \mathbb{N}$

Then, for $n = km$:

$$\begin{aligned}
 U_n(t) &= \underbrace{\left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \dots \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right)}_{n \text{ times}} \\
 &= U_{\text{kick}}^n U_{\text{kick}}^{\dagger n-1} e^{-i\frac{t}{n}H} U_{\text{kick}}^{n-1} \dots U_{\text{kick}}^{\dagger} e^{-i\frac{t}{n}H} U_{\text{kick}} e^{-i\frac{t}{n}H} \\
 &= e^{-i\frac{t}{n}H_{n-1}} \dots e^{-i\frac{t}{n}H_1} e^{-i\frac{t}{n}H_0}
 \end{aligned}$$

An “effective” average is taking place:

$$\bar{H} = \frac{1}{n} \sum_{\ell=0}^{n-1} H_{\ell} = \frac{1}{n} \sum_{\ell=0}^{n-1} U_{\text{kick}}^{\dagger \ell} H U_{\text{kick}}^{\ell} = \dots = \sum_{\mu} P_{\mu} H P_{\mu} = H_Z \quad (n = km)$$

$[H_Z, U_{\text{kick}}] = 0$, only the diagonal part survives the limit while the off-diagonal part $H_{od} = H - H_Z$ (satisfying $[H_{od}, U_{\text{kick}}] \neq 0$) is averaged to zero.

Trotter product formula

Continuous
Coupling

Bang-Bang
control

Comparison

A and B operators on some finite dimensional Hilbert space \mathcal{H} .

$$[A, B] \neq 0 \implies e^{A+B} \neq e^A e^B$$

“Remedy”:

Trotter product formula

$$e^{A+B} = \lim_{n \rightarrow \infty} \left(e^{A/n} e^{B/n} \right)^n$$

n large but finite:

$$\left| e^{A+B} - \left(e^{A/n} e^{B/n} \right)^n \right| = O\left(\frac{1}{n}\right)$$

This still works with the sum of a **finite** number of operators A_1, \dots, A_m :

$$e^{A_1 + \dots + A_m} = \left(e^{A_1/n} e^{A_2/n} \dots e^{A_m/n} \right)^n + O\left(\frac{1}{n}\right)$$

We cannot go further if we want to retain this rate of convergence.

Dynamical decoupling

Pulsed evolution:

Kicking Unitary

$$U_{\text{kick}} = \sum_{\mu} e^{-i\lambda_{\mu}} P_{\mu}$$

Idea behind the method: suppose that $U_{\text{kick}}^m = \mathbb{I}$ for some $m \in \mathbb{N}$

Then, for $n = km$:

$$\begin{aligned} U_n(t) &= \underbrace{\left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \dots \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right)}_{n \text{ times}} \\ &= U_{\text{kick}}^n U_{\text{kick}}^{\dagger n-1} e^{-i\frac{t}{n}H} U_{\text{kick}}^{n-1} \dots U_{\text{kick}}^{\dagger} e^{-i\frac{t}{n}H} U_{\text{kick}} e^{-i\frac{t}{n}H} \\ &= e^{-i\frac{t}{n}H} e^{-i\frac{t}{n}H} \dots e^{-i\frac{t}{n}H} e^{-i\frac{t}{n}H} \end{aligned}$$

$$H_{\ell} = U_{\text{kick}}^{\dagger \ell} H U_{\text{kick}}^{\ell}$$

An “effective” average is taking place:

$$\bar{H} = \frac{1}{n} \sum_{\ell=0}^{n-1} H_{\ell} = \frac{1}{n} \sum_{\ell=0}^{n-1} U_{\text{kick}}^{\dagger \ell} H U_{\text{kick}}^{\ell} = \dots = \sum_{\mu} P_{\mu} H P_{\mu} = H_Z \quad (n = km)$$

$[H_Z, U_{\text{kick}}] = 0$, only the diagonal part survives the limit while the off-diagonal part $H_{od} = H - H_Z$ (satisfying $[H_{od}, U_{\text{kick}}] \neq 0$) is averaged to zero.

Continuous Coupling

Bang-Bang control

Comparison

Dynamical decoupling

For a **finite** number of operators A_1, A_2, \dots, A_m :

$$\left(e^{A_1/n} e^{A_2/n} \dots e^{A_m/n} \right)^n = e^{A_1 + \dots + A_m} + O\left(\frac{1}{n}\right)$$

Idea behind the method: suppose that $U_{\text{kick}}^m = \mathbb{I}$ for some $m \in \mathbb{N}$

Then, for $n = km$:

$$\begin{aligned} U_n(t) &= \underbrace{\left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \dots \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right)}_{n \text{ times}} \\ &= U_{\text{kick}}^n U_{\text{kick}}^{\dagger n-1} e^{-i\frac{t}{n}H} U_{\text{kick}}^{n-1} \dots U_{\text{kick}}^{\dagger} e^{-i\frac{t}{n}H} U_{\text{kick}} e^{-i\frac{t}{n}H} \\ &= e^{-i\frac{t}{n}H_{n-1}} \dots e^{-i\frac{t}{n}H_1} e^{-i\frac{t}{n}H_0} \end{aligned}$$

Kicking Unitary

$$U_{\text{kick}} = \sum_{\mu} e^{-i\lambda_{\mu}} P_{\mu}$$

$$H_{\ell} = U_{\text{kick}}^{\dagger \ell} H U_{\text{kick}}^{\ell}$$

An “effective” average is taking place:

$$\bar{H} = \frac{1}{n} \sum_{\ell=0}^{n-1} H_{\ell} = \frac{1}{n} \sum_{\ell=0}^{n-1} U_{\text{kick}}^{\dagger \ell} H U_{\text{kick}}^{\ell} = \dots = \sum_{\mu} P_{\mu} H P_{\mu} = H_Z \quad (n = km)$$

$[H_Z, U_{\text{kick}}] = 0$, only the diagonal part survives the limit while the off-diagonal part $H_{od} = H - H_Z$ (satisfying $[H_{od}, U_{\text{kick}}] \neq 0$) is averaged to zero.

Dynamical decoupling

For a **finite** number of operators A_1, A_2, \dots, A_m :

$$\left(e^{A_1/n} e^{A_2/n} \dots e^{A_m/n} \right)^n = e^{A_1 + \dots + A_m} + O\left(\frac{1}{n}\right)$$

Idea behind the method: suppose that $U_{\text{kick}}^m = \mathbb{I}$ for some $m \in \mathbb{N}$
Then, for $n = km$:

$$\begin{aligned} U_n(t) &= \underbrace{\left[\left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \dots \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right) \right]}_{m \text{ times}}^k \\ &= \left[U_{\text{kick}}^m U_{\text{kick}}^{\dagger m-1} e^{-i\frac{t}{n}H} U_{\text{kick}}^{n-1} \dots U_{\text{kick}}^{\dagger} e^{-i\frac{t}{n}H} U_{\text{kick}} e^{-i\frac{t}{n}H} \right]^k \\ &= \left[e^{-i\frac{t}{km}H_{m-1}} \dots e^{-i\frac{t}{km}H_1} e^{-i\frac{t}{km}H_0} \right]^k = e^{-it\bar{H}} + O\left(\frac{1}{k}\right) \end{aligned}$$

An “effective” average is taking place:

$$\bar{H} = \frac{1}{m} \sum_{\ell=0}^{m-1} H_{\ell} = \frac{1}{m} \sum_{\ell=0}^{m-1} U_{\text{kick}}^{\dagger \ell} H U_{\text{kick}}^{\ell} = \dots = \sum_{\mu} P_{\mu} H P_{\mu} = H_Z$$

$[H_Z, U_{\text{kick}}] = 0$, only the diagonal part survives the limit while the off-diagonal part $H_{od} = H - H_Z$ (satisfying $[H_{od}, U_{\text{kick}}] \neq 0$) is averaged to zero.

Kicking Unitary

$$U_{\text{kick}} = \sum_{\mu} e^{-i\lambda_{\mu}} P_{\mu}$$

Bang-bang control

Pulsed evolution:

Evolution operator:

$$U_n(t) = \left(U_{\text{kick}} e^{-i\frac{t}{n}H} \right)^n$$

Kicking Unitary

$$U_{\text{kick}} = \sum_{\mu} e^{-i\lambda_{\mu}} P_{\mu}$$

Very frequent kicks: $n \rightarrow \infty$

$$\left(U_{\text{kick}} e^{-iHt/n} \right)^n - U_{\text{kick}}^n e^{-iH_Z t} = O\left(\frac{1}{n}\right)$$

$$H_Z = \sum_{\mu} P_{\mu} H P_{\mu}$$

Example: bang-bang control

control

Comparison

$$H = \begin{pmatrix} 0 & \Omega_{12} & 0 & 0 \\ \Omega_{12} & 0 & \Omega_{23} & 0 \\ 0 & \Omega_{23} & 0 & \Omega_{34} \\ 0 & 0 & \Omega_{34} & 0 \end{pmatrix}$$

$$U_{\text{kick}} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & \cos(\lambda) & -i \sin(\lambda) \\ 0 & 0 & -i \sin(\lambda) & \cos(\lambda) \end{pmatrix}$$

Comparison

Continuous Coupling
Bang-Bang control
Comparison

Continuous Coupling

$$U_K(t) = e^{-it(KV+H)}$$

Pulsed evolution

$$U_n(t) = \left(e^{-itV} e^{-i\frac{t}{n}H} \right)^n$$

Both evolutions yield a dynamics generated by

$$H_Z = \sum_{\mu} P_{\mu} H P_{\mu}$$
