Lack of thermalization in quantum systems: Localization and glassiness

lunedì 25 giugno 2018 11:30 (45 minuti)

Abstract: I will review some recent results on ergodicity breaking in many-body systems due to quantum effects. I will underline the similarities and differences with ergodicity breaking in spin glasses, in particular looking at the random energy model, the p-spin model and the Edwards-Anderson spin glass on the Bethe lattice endowed with quantum dynamics.
