Kinetic inductance detectors on CaF₂ for spin-dependent dark matter search

Thursday, July 25, 2019 6:45 PM (15 minutes)

CaF₂ is a novel target for neutrino-less double-beta decay and spin-dependent dark matter studies, since ⁴⁸Ca is one of the double-beta decay nuclei and ¹⁹F is sensitive to spin-dependent elastic scattering with dark matter.

We implement kinetic inductance detectors(KIDs) on CaF₂ crystal which is used as substrate. KIDs on CaF₂ is cooled to low temperature with a dilution fridge. The resonance is found in O(1GHz). In addition, several basic parameters of KIDs are measured. Thus, we confirmed that KIDs on CaF₂ worked well. This result opens a new possibility in the next generation of astroparticle physics experiments.
