

# Multi-isotope Experimental Validation of Calorimetric Electron Capture Spectral Theory

Katrina E. Koehler<sup>1</sup>, Michael A. Famiano<sup>2</sup>, Christopher J. Fontes<sup>1</sup>, Michael W. Rabin<sup>1</sup>, Dan R. Schmidt<sup>3</sup>, Chandler M. Smith<sup>1</sup>, Aidan D. Tollefson<sup>1</sup>, Joel N. Ullom<sup>3</sup>, Michael D. Yoho<sup>1</sup>, Mark P. Croce<sup>1</sup> <sup>1</sup>Los Alamos National Laboratory <sup>2</sup>Western Michigan University <sup>3</sup>National Institute of Standards and Technology LA-UR-19-26573

#### **Motivation**

Electron capture is a 2-body reaction. A measure of the excited atom's energy is a measure of the neutrino's energy.

<sup>163</sup>Ho 
$$\rightarrow$$
 <sup>163</sup>Dy<sup>\*</sup> +  $\nu_e \rightarrow$  <sup>163</sup>Dy +  $\nu_e$  + (electrons, photons, phonons)  
 $\Gamma_{atom} = Q - E_{\nu}$ 

ν<sub>e</sub> e √ x-ray

The advantage of a calorimetric measurement (conceptual drawing at left): no need to know fluorescent yield, because all atomic decay energy is thermalized and measured as heat. Microcalorimeter Transition Edge Sensors (right) provide the required energy resolution (< 10eV FWHM at 2 keV) for a kinematic neutrino mass measurement.

The endpoint region is most sensitive to the neutrino mass. Need a validated theory to extract neutrino mass without systematic uncertainty!

(Left) Theoretically calculated spectrum with 10<sup>7</sup> decays (red) with current <sup>163</sup>Ho data (LANL, black. ECHo, blue). (Right) Conceptual drawing of the spectral endpoint, showing sensitivity to the kinematic neutrino mass.

<sup>163</sup>Ho Peak Ratios are not experimentally well-constrained.

Theoretical calculations of the peak ratios vary significantly based on atomic structure code generating orbital wave functions AND order of antisymmetrization.

# Validating a theory...

- Comparing theoretical predictions on features far from the end point
- Using theory on other isotopes

Modern <sup>55</sup>Fe Peak Ratios agree best with EC-capture calculations. Better energy resolution → Better theoretical evaluations L1/K and L2/K instead of L/K

## Comparisons of Theory and Experimental <sup>193</sup>Pt Ratios
