# Is quantum theory exact?

## The quest for the spin-statistics connection violation and related items

# Measurement problem

The linear nature of QM allows **superposition of macro-object states** → *Von Neumann measurement scheme* (A. Bassi, G. C. Ghirardi Phys. Rep 379 257 (2003))

If we assume the theory is complete .. two possible ways out

- **Two dynamical principles:** a) **evolution** governed by Schrödinger equation (**unitary, linear**) b) measurement process governed by **WPR (stochastic, nonlinear)**. But .. where does quantum and classical behaviours split?
- **Dynamical Reduction Models: non linear and stochastic** modification of the Hamiltonian dynamics:

**QMSL** - particles experience spontaneous localizations around appropriate positions, at random times according to a Poisson distribution with  $\lambda = 10^{-16} \text{ s}^{-1}$ .

(Ghirardi, Rimini, and Weber, Phys. Rev. D 34, 470 (1986); ibid. 36, 3287 (1987); Found. Phys. 18, 1 (1988))

**CSL** - stochastic and nonlinear terms in the Schrödinger equation induce diffusion process for the state vector → reduction.

# CSL model

$$d|\psi_t\rangle = \left[ -\frac{i}{\hbar}H dt + \sqrt{\lambda} \int d^3x (N(\mathbf{x}) - \langle N(\mathbf{x}) \rangle_t) dW_t(\mathbf{x}) - \frac{\lambda}{2} \int d^3x (N(\mathbf{x}) - \langle N(\mathbf{x}) \rangle_t)^2 dt \right] |\psi_t\rangle$$

System's Hamiltonian

NEW COLLAPSE TERMS

**New Physics**

$N(\mathbf{x}) = a^\dagger(\mathbf{x})a(\mathbf{x})$  particle density operator

**choice of the preferred basis**

$\langle N(\mathbf{x}) \rangle_t = \langle \psi_t | N(\mathbf{x}) | \psi_t \rangle$

**nonlinearity**

$W_t(\mathbf{x}) = \text{noise}$   $\mathbb{E}[W_t(\mathbf{x})] = 0$ ,  $\mathbb{E}[W_t(\mathbf{x})W_s(\mathbf{y})] = \delta(t-s)e^{-(\alpha/4)(\mathbf{x}-\mathbf{y})^2}$

**stochasticity**

$\lambda = \text{collapse strength}$   $r_C = 1/\sqrt{\alpha} = \text{correlation length}$

**two parameters**

# Which values for $\lambda$ and $r_c$ ?

## Microscopic world (few particles)

$$\lambda \sim 10^{-8 \pm 2} \text{s}^{-1}$$

QUANTUM - CLASSICAL  
TRANSITION  
(Adler - 2007)

## Mesoscopic world Latent image formation + perception in the eye ( $\sim 10^4 - 10^5$ particles)

S.L. Adler, JPA 40, 2935 (2007)

A. Bassi, D.A. Deckert & L. Ferialdi, EPL 92, 50006 (2010)

$$\lambda \sim 10^{-17} \text{s}^{-1}$$

QUANTUM - CLASSICAL  
TRANSITION  
(GRW - 1986)

## Macroscopic world ( $> 10^{13}$ particles)

G.C. Ghirardi, A. Rimini and T. Weber, PRD 34, 470 (1986)

$$r_c = 1/\sqrt{\alpha} \sim 10^{-5} \text{cm}$$

Increasing size of the system

# **Diosi – Penrose collapse model**

- **Wave function collapse induced by gravity:**

**When a system is in a quantum superposition of two different positions then a corresponding superposition of two different space-times is generated, the superposition of the two bumps in space-time associated to the two mass distributions.**

**Superpositions of different geometries would be suppressed.**

- **The more massive the superposition, the faster it is suppressed.**

**The model characteristic parameter:**

**$R_0$  - size of the wave function defining the mass distribution**

# ... spontaneous photon emission

Besides collapsing the state vector to the position basis in non relativistic QM the **interaction with the stochastic field increases the expectation value of particle's energy**

implies **for a charged particle energy radiation (not present in standard QM)**

- 1) **test of collapse models (ex. Karolyhazy model, collapse is induced by fluctuations in space-time → unreasonable amount of radiation in the X-ray range).**
- 2) **provides constraints on the parameters of the CSL model**

**Q. Fu, Phys. Rev. A 56, 1806 (1997)**

**S. L. Adler and F. M. Ramazanoglu, J. Phys. A40, 13511 (2007)**

**J. Phys. A42, 109801 (2009)**

**S. L. Adler, A. Bassi and S. Donadi,**

**J. Phys. A46, 245304 (2013)**

## FREE PARTICLE

1. Quantum mechanics

2. Collapse models

# First limit from Ge detector measurement

**Q. Fu, Phys. Rev. A 56, 1806 (1997) → upper limit on  $\lambda$  comparing with the radiation measured with isolated slab of Ge (raw data not background subtracted)**  
**H. S. Miley, et al., Phys. Rev. Lett. 65, 3092 (1990)**

Energy (keV)	Expt. upper bound (counts/keV/kg/day)	Theory (counts/keV/kg/day)
11	0.049	0.071
101	0.031	0.0073
201	0.030	0.0037
301	0.024	0.0028
401	0.017	0.0019
501	0.014	0.0015

TABLE I. Experimental upper bounds and theoretical predictions of the spontaneous radiation by free electrons in Ge for a range of photon energy values.

**Comparison with the lower energy bin, due to the non-relativistic constraint of the CSL model**

$$\frac{d\Gamma(E)}{dE} = c \frac{e^2 \lambda}{4\pi^2 r_C^2 m^2 E} = (4) \cdot (8.29 \cdot 10^{24}) \cdot (8.64 \cdot 10^4) \frac{e^2 \lambda}{4\pi^2 r_C^2 m^2 E} \leq \left. \frac{d\Gamma(E)}{dE} \right|_{ex}$$

**4 valence electrons are considered**  
**BE ~ 10 eV ≪ energy of emitted  $\gamma$  ~ 11 keV**  
**quasi-free electrons**

**(Atoms / Kg)**  
**in Ge**

**1 day**

**S. L. Adler, F. M. Ramazanoglu, J. Phys. A40 (2007), 13395**  
**J. Mullin, P. Pearle, Phys. Rev. A90 (2014), 052119**

**$\lambda < 2 \times 10^{-16} \text{ s}^{-1}$  non-mass proportional**  
 **$\lambda < 8 \times 10^{-10} \text{ s}^{-1}$  mass proportional**

# Improvement from IGEX data

## **ADVANTAGES:**

- **IGEX low-activity Ge based experiment dedicated to the  $\beta\beta_{0\nu}$  decay research. (C. E. Aalseth et al., IGEX collaboration Phys. Rev. C 59, 2108 (1999))**
- **exposure of 80 kg day in the energy range:  $\Delta E = (4 - 49) \text{ keV} \ll m_e = 512 \text{ keV}$  (A. Morales et al., IGEX collaboration Phys. Lett. B 532, 8-14 (2002)) → possibility to perform a fit,**

## **DISADVANTAGE:**

- **no simulation of the known background sources is available . . .**

**ASSUMPTION 1 - the upper limit on  $\lambda$  corresponds to the case in which all the measured X-ray emission would be produced by spontaneous emission processes**

**ASSUMPTION 2 - the detector efficiency in  $\Delta E$  is one, muon veto and pulse shape analysis un-efficiencies are small above 4keV.**

# Increasing the number of emitting electrons

Consider the 30 outermost electrons emitting *quasi free* → we are confined to the experimental range:  $\Delta E = (14 - 49)$  keV fit is not more reliable ...

$$\frac{d\Gamma(E)}{dE} = \frac{\alpha(\lambda)}{E}$$

Figure 1. Fit of the X-ray emission spectrum measured by the IGEX experiment [14,15], using the theoretical fit function Equation (7). The black line corresponds to the experimental distribution; the red dashed line represents the fit. See the text for more details.

# Increasing the number of emitting electrons

Consider the 30 outermost electrons emitting *quasi free* → we are confined to the experimental range:  $\Delta E = (14 - 49)$  fit is not more reliable ...

let's extract the p. d. f. of  $\lambda$ :

experimental ingredient

$$G(y_i|P, \Lambda_i) = \frac{\Lambda_i^{y_i} e^{-\Lambda_i}}{y_i!}$$

$$y = \sum_{i=1}^n y_i \quad , \quad \Lambda = \sum_{i=1}^n \Lambda_i$$

theoretical ingredient

$$\Lambda(\lambda) = y_s + 1 = \sum_{i=1}^n c \frac{e^2 \lambda}{4\pi^2 r_C^2 m^2 E_i} + 1 = \sum_{i=1}^n \frac{\alpha(\lambda)}{E_i} + 1$$

Bayesian probability inversion

$$G'(\lambda|G(y|P, \Lambda)) \propto \left( \sum_{i=1}^n \frac{\alpha(\lambda)}{E_i} + 1 \right)^y e^{-\left( \sum_{i=1}^n \frac{\alpha(\lambda)}{E_i} + 1 \right)}$$

Upper limit on  $\lambda$  :

$$\int_0^{\lambda_0} G'(\lambda|G(y|P, \Lambda)) d\lambda$$

# Further increasing the number of emitting electrons

$$\lambda \leq 6.8 \cdot 10^{-12} \text{s}^{-1} \quad \text{mass prop.,}$$

$$\lambda \leq 2.0 \cdot 10^{-18} \text{s}^{-1} \quad \text{non-mass prop..}$$

emission processes.**

# The setup

## High purity Ge detector measurement:

- active Ge detector surrounded by complex electrolytic Cu + Pb shielding
- 10B-polyethylene plates reduce the neutron flux towards the detector
- shield + cryostat enclosed in air tight steel housing flushed with nitrogen to avoid contact with external air (and thus radon).

FIG. 1: Schematic representation of the experimental setup: 1 - Ge crystal, 2 - Electric contact, 3 - Plastic isolator, 4 - Copper cup, 5 - Copper end-cup, 6 - Copper block + plate, 7 Inner Copper shield, 8 - Lead shield.

# p. d. f. of $\lambda$

## theoretical information

**Goal: obtain** the probability distribution function **PDF( $\lambda$ )** of the collapse rate parameter given:

- the **theoretical information**

**A. Bassi & S. Donadi**  
**University and INFN of Trieste**

$$\frac{d\Gamma}{dE} = \left\{ (N_p^2 + N_e) \cdot (m n T) \right\} \frac{\lambda \hbar e^2}{4\pi^2 \epsilon_0 c^3 m_N^2 r_c^2 E}$$

**Rate of spontaneously emitted photons as a consequence of  $p$  and  $e$  interaction with the stochastic field,**

**(depending on  $\lambda$ )**

**as a function of  $E$**

**(mass of the emitting material • number of atoms per unit mass • total acquisition time)**

# p. d. f. of $\lambda$

## theoretical information

**Goal: obtain** the probability distribution function **PDF( $\lambda$ )** of the collapse rate parameter given:

- the **theoretical information**

$$\frac{d\Gamma}{dE} = \left\{ (N_p^2 + N_e) \cdot (m n T) \right\} \frac{\lambda \hbar e^2}{4\pi^2 \epsilon_0 c^3 m_N^2 r_c^2 E}$$

**Provided that the wavelength of the emitted photon:**

- is greater than the nuclear dimensions  $\rightarrow$  protons contribute coherently
- is smaller than the lower electronic orbit  $\rightarrow$  protons and electrons emit independently
- electrons and protons can be considered as non-relativistic.

# p. d. f. of $\lambda$

## experimental information

**Goal: obtain** the probability distribution function **PDF( $\lambda$ )** of the collapse rate parameter given:

- **the experimental information**

**low background environment of the LNGS (INFN)**

**low activity Ge detectors.  
(three months data taking with 2kg germanium active mass)**

**protons emission is considered in  $\Delta E = (1000-3800)$  keV.**

**For lower energies residual cosmic rays and Compton in the outer lead shield complex MC staff.**

# p. d. f. of $\lambda$

## experimental information

**Goal: obtain** the probability distribution function **PDF( $\lambda$ )** of the collapse rate parameter given:

- the **experimental information**

**total number of counts in the selected energy range:**

$$f(z_c) = \frac{\Lambda_c^{z_c} e^{-\Lambda_c}}{z_c!}$$

**from MC of the detector** →

**from theory weighted  
by detector efficiency** →

- $z_b$  = number of counts due to background,
- $z_s$  = number of counts due to signal,
- $z_c = z_b + z_s$  ;  $z_s \sim P_{\Lambda_s}$  ;  $z_b \sim P_{\Lambda_b}$ ,

$$f(\lambda|\text{ex, th}) = \frac{(\Lambda_s(\lambda) + \Lambda_b)^{z_c} \cdot e^{-(\Lambda_s(\lambda) + \Lambda_b)}}{z_c!} \quad \lambda < 10^{-6} \text{s}^{-1}$$

- Advantages ..**
- **possibility to extract unambiguous limits corresponding to the probability level you prefer,**
  - **$f(\lambda)$  can be updated with all the experimental information at your disposal by updating the likelihood,**
  - **competing or future models can be simply implemented**

# Expected spontaneous emission signal

Each material spontaneously emits with different *masses, densities* and  $\varepsilon(E)$   
(depending on the material and the geometry of the detector)

**Simulated detection efficiency for  $\gamma$ s produced inside the Germanium detector, multiplied by  $10^4$**

**Photon detection efficiencies** obtained by means of **MC simulations**, generating  $\gamma$ s in the range (E1 – E2) (25 points for each material).

**The detector components have been put into a validated MC code (MaGe, Boswell et al., 2011) Based on the GEANT4 software library (Agostinelli et al., 2003)**

# Expected spontaneous emission signal

Expected signal is obtained by weighting for the detection efficiencies

efficiency distributions fitted to obtain the efficiency functions:

$$\epsilon_i(E) = \sum_{j=0}^{ci} \xi_{ij} E^j$$

to obtain the **signal predicted by theory & processed by the detector**

$$\begin{aligned} z_s(\lambda) &= \sum_i \int_{E_1}^{E_2} \left. \frac{d\Gamma}{dE} \right|_i \epsilon_i(E) dE = \\ &= \sum_i \int_{E_1}^{E_2} N_{pi}^2 \alpha_i \beta \frac{\lambda}{E} \sum_{j=0}^{ci} \xi_{ij} E^j dE \end{aligned}$$

**with:**

$$\begin{aligned} \alpha_i &= m_i n_i T, \\ \beta &= \frac{\hbar e^2}{4\pi^2 \epsilon_0 c^3 m_N^2 r_c^2} \end{aligned}$$

# Expected BKG

**radionuclides decay simulation accounts for:**

- **emission probabilities & decay scheme of each radionuclide**
- **photons propagation and interactions inside the materials of the detector**
- **detection efficiency,**

**Considered contributions:**

- **Co60 from the inner Copper**
- **Co60 from the Copper block + plate**
- **Co58 from the Copper block + plate**
- **K40 from Bronze**
- **Ra226 from Bronze**
- **Bi214 from Bronze**
- **Pb214 from Bronze**
- **Bi212 from Bronze**
- **Pb212 from Bronze**
- **Tl208 from Bronze**
- **Ra226 from Poliethylene**
- **Bi214 from Poliethylene**
- **Pb214 from Poliethylene**

# Expected BKG

radionuclides decay simulation accounts for:

- emission probabilities & decay scheme of each radionuclide
- photons propagation and interactions inside the materials of the detector
- detection efficiency,

Considered contributions:

- Co60 from the inner Copper
- Co60 from the Copper block + plate
- Co58 from the Copper block + plate
- K40 from Bronze
- Ra226 from Bronze
- Bi214 from Bronze
- Pb214 from Bronze
- Bi212 from Bronze
- Pb212 from Bronze
- Tl208 from Bronze
- Ra226 from Poliethylene
- Bi214 from Poliethylene
- Pb214 from Poliethylene

measured  
activities

$$z_{b,ij} = \frac{m_i A_{ij} T N_{rec,ij}}{N_{ik}}$$

detected MC  
 $\gamma$ s

# simulated  
events

Expected number  
of background  
counts

$$\Lambda_b = z_b + 1$$

Presently we can describe 88% of the measured  
spectrum

# Upper limit for the collapse rate parameter $\lambda$

- From the p.d.f we obtain the cumulative distribution function:

$$F(\lambda) = \frac{\int_0^\lambda f(\lambda|\text{ex, th})d\lambda}{\int_0^\infty f(\lambda|\text{ex, th})d\lambda} = \frac{\int_0^\lambda \frac{1}{z_c!} (a\lambda + \Lambda_b + 1)^{z_c} e^{-(a\lambda + \Lambda_b + 1)} d\lambda}{\int_0^\infty \frac{1}{z_c!} (a\lambda + \Lambda_b + 1)^{z_c} e^{-(a\lambda + \Lambda_b + 1)} d\lambda}$$

which we express in terms of upper incomplete gamma functions

$$F(\lambda) = 1 - \frac{\Gamma(z_c + 1, a\lambda + 1 + \Lambda_b)}{\Gamma(z_c + 1, 1 + \Lambda_b)}$$

- put the measured  $z_c$  and the calculated  $\Lambda_s(\lambda) = a\lambda + 1$ ,  $\Lambda_b$  in the cumulative distribution function

extract the limit at the desired probability level ...

**$\lambda < 5,2 \cdot 10^{-13}$  with a probability of 95%**

**Gain factor ~ 13**

**Preliminary**

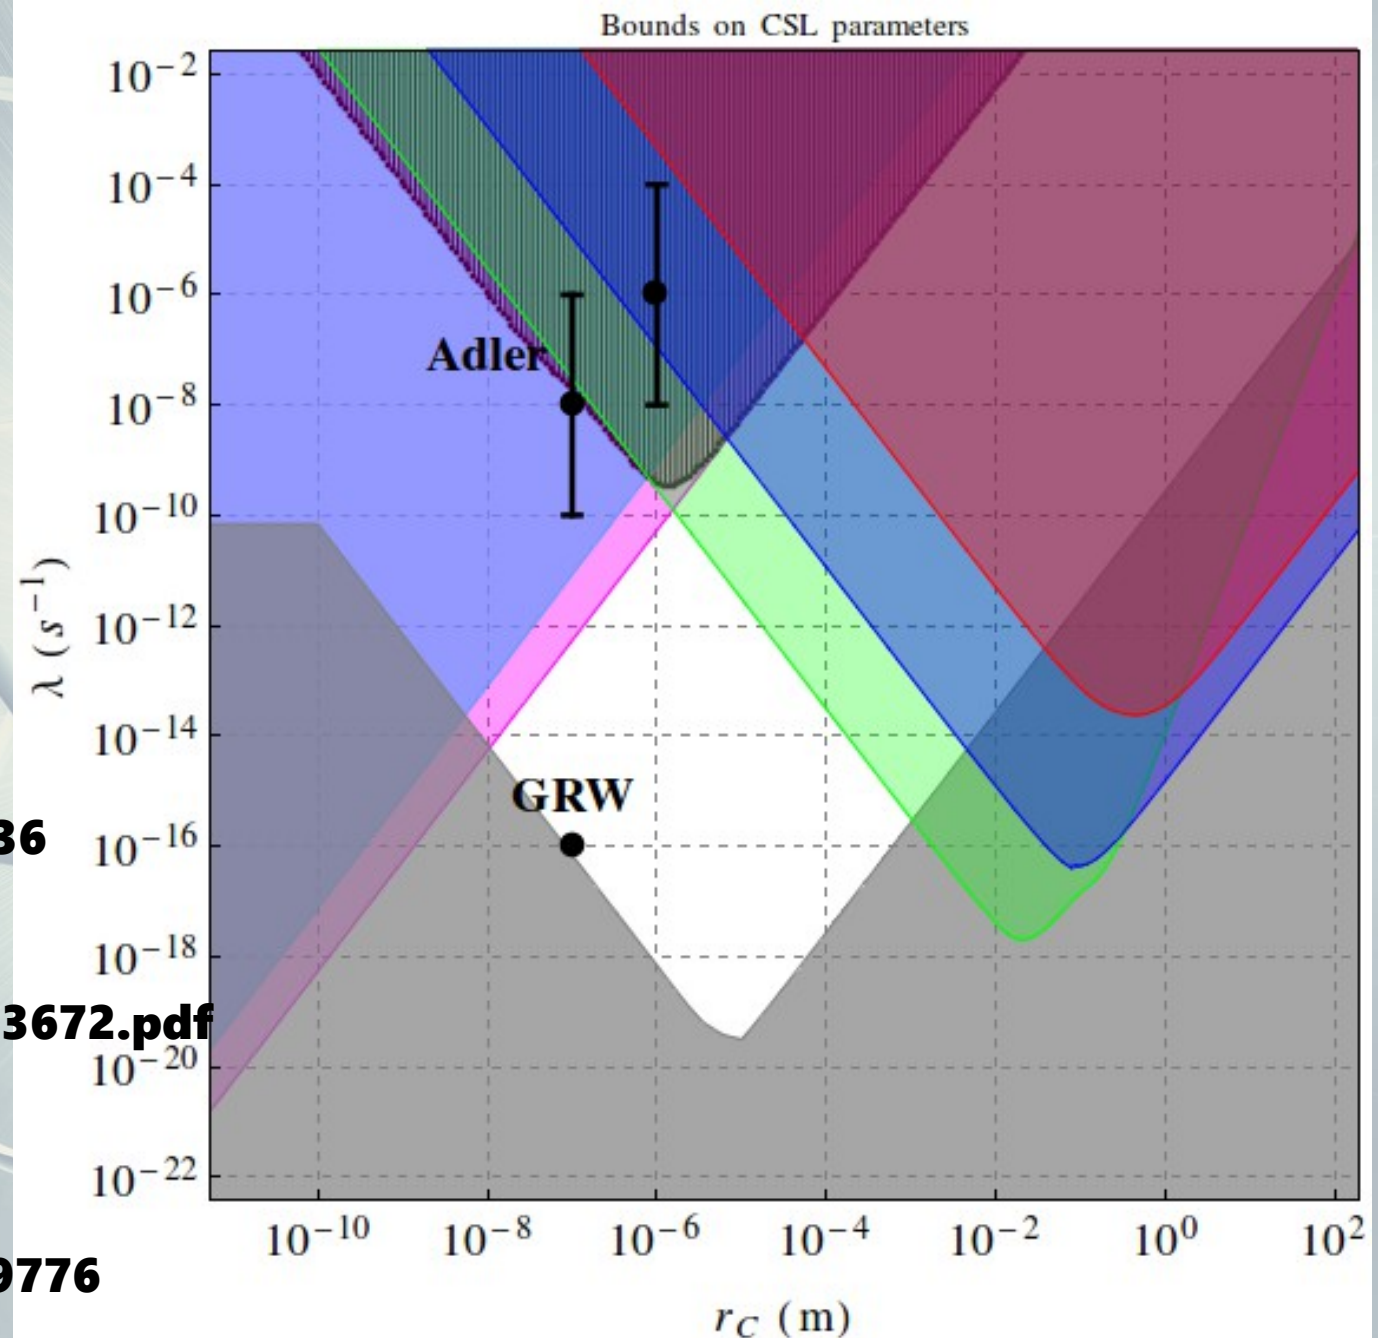

# Upper limit for the collapse rate parameter $\lambda$

$\lambda < 5,3 \cdot 10^{-13}$  with  
a probability of 95%

Preliminary

# Upper limit on the parameter $R_0$

- **The total number of expected counts has now a non-linear dependence on the parameter  $R_0$  :**

$$\Lambda_c = z_s + z_b + 1 = \frac{a}{R^3} + z_b + 1,$$

- **Again we apply probability inversion to obtain the searched pdf( $R_0$ ):**

$$\tilde{p}(R_0|p(z_c|\Lambda_c)) = \frac{p(z_c|\Lambda_c) \cdot \tilde{p}_0(R_0)}{\int_D p(z_c|\Lambda_c) \cdot \tilde{p}_0(R_0) dR_0}, \quad \tilde{p}_0(R_0) = \begin{cases} 0, & \text{if } R_0 < 10^{-14} = R_0^{min} \\ \text{const}, & \text{otherwise} \end{cases}$$

**prior imposed by the model**

$$\tilde{p}(R_0|p(z_c|\Lambda_c)) = \frac{\left(\frac{a}{R_0^3} + z_b + 1\right)^{z_c} \cdot e^{-\left(\frac{a}{R_0^3} + z_b + 1\right)} \cdot \theta(R_0 - R_0^{min})}{\int_D \left(\frac{a}{R_0^3} + z_b + 1\right)^{z_c} \cdot e^{-\left(\frac{a}{R_0^3} + z_b + 1\right)} \cdot \theta(R_0 - R_0^{min}) dR_0}.$$

- **From which the cumulative pdf assumes the expression:**

$$\tilde{P}(\bar{R}_0) = \frac{\sum_{k=0}^{z_c} \binom{z_c}{k} b^{z_c-k} \int_{\frac{a}{\bar{R}_0^3}}^{\frac{a}{(R_0^{min})^3}} y^{k-\frac{4}{3}} e^{-y} dy}{\sum_{k=0}^{z_c} \binom{z_c}{k} b^{z_c-k} \int_0^{\frac{a}{(R_0^{min})^3}} y^{k-\frac{4}{3}} e^{-y} dy},$$

# Upper limit on the parameter $R_0$

- **Cumulative pdf to be handled with care :**

$$\tilde{P}(\bar{R}_0) = \frac{\sum_{k=0}^{z_c} \binom{z_c}{k} b^{z_c-k} \int_{\frac{a}{\bar{R}_0^3}}^{\frac{a}{(R_0^{min})^3}} y^{k-\frac{4}{3}} e^{-y} dy}{\sum_{k=0}^{z_c} \binom{z_c}{k} b^{z_c-k} \int_0^{\frac{a}{(R_0^{min})^3}} y^{k-\frac{4}{3}} e^{-y} dy},$$

$$\tilde{P}(\bar{R}_0) = \frac{\sum_{k=0}^{z_c} \binom{z_c}{k} b^{z_c-k} \left[ \Gamma\left(k - \frac{1}{3}, \frac{a}{\bar{R}_0^3}\right) - \Gamma\left(k - \frac{1}{3}, \frac{a}{(R_0^{min})^3}\right) \right]}{\sum_{k=0}^{z_c} \binom{z_c}{k} b^{z_c-k} \left[ \Gamma\left(k - \frac{1}{3}\right) - \Gamma\left(k - \frac{1}{3}, \frac{a}{(R_0^{min})^3}\right) \right]}.$$

$$\tilde{P}(\bar{R}_0) = \frac{\sum_{k=0}^{z_c} \binom{z_c}{k} b^{z_c-k} \left[ \sum_{n=0}^{\infty} \frac{-1^n}{n!} \frac{\left(\frac{a}{(R_0^{min})^3}\right)^{n+k-1/3} - \left(\frac{a}{\bar{R}_0^3}\right)^{n+k-1/3}}{n+k-1/3} \right]}{\sum_{k=0}^{z_c} \binom{z_c}{k} b^{z_c-k} \left[ \sum_{n=0}^{\infty} \frac{-1^n}{n!} \frac{\left(\frac{a}{(R_0^{min})^3}\right)^{n+k-1/3} - \left(\frac{a}{\bar{R}_0^3}\right)^{n+k-1/3}}{n+k-1/3} \right]}.$$

- **work in progress, expected limit :  $R_0 > 10^{-11} - 10^{-10}$**

**Thanks**

# The setup

**High purity Ge detector measurement collaboration with M. Laubenstein @ LNGS (INFN):**

- active Ge detector surrounded by complex electrolytic Cu + Pb shielding
- polyethylene plates reduce the neutron flux towards the detector
- shield + cryostat enclosed in air tight steel housing flushed with nitrogen to avoid contact with external air (and thus radon).

**Experimental set-up**

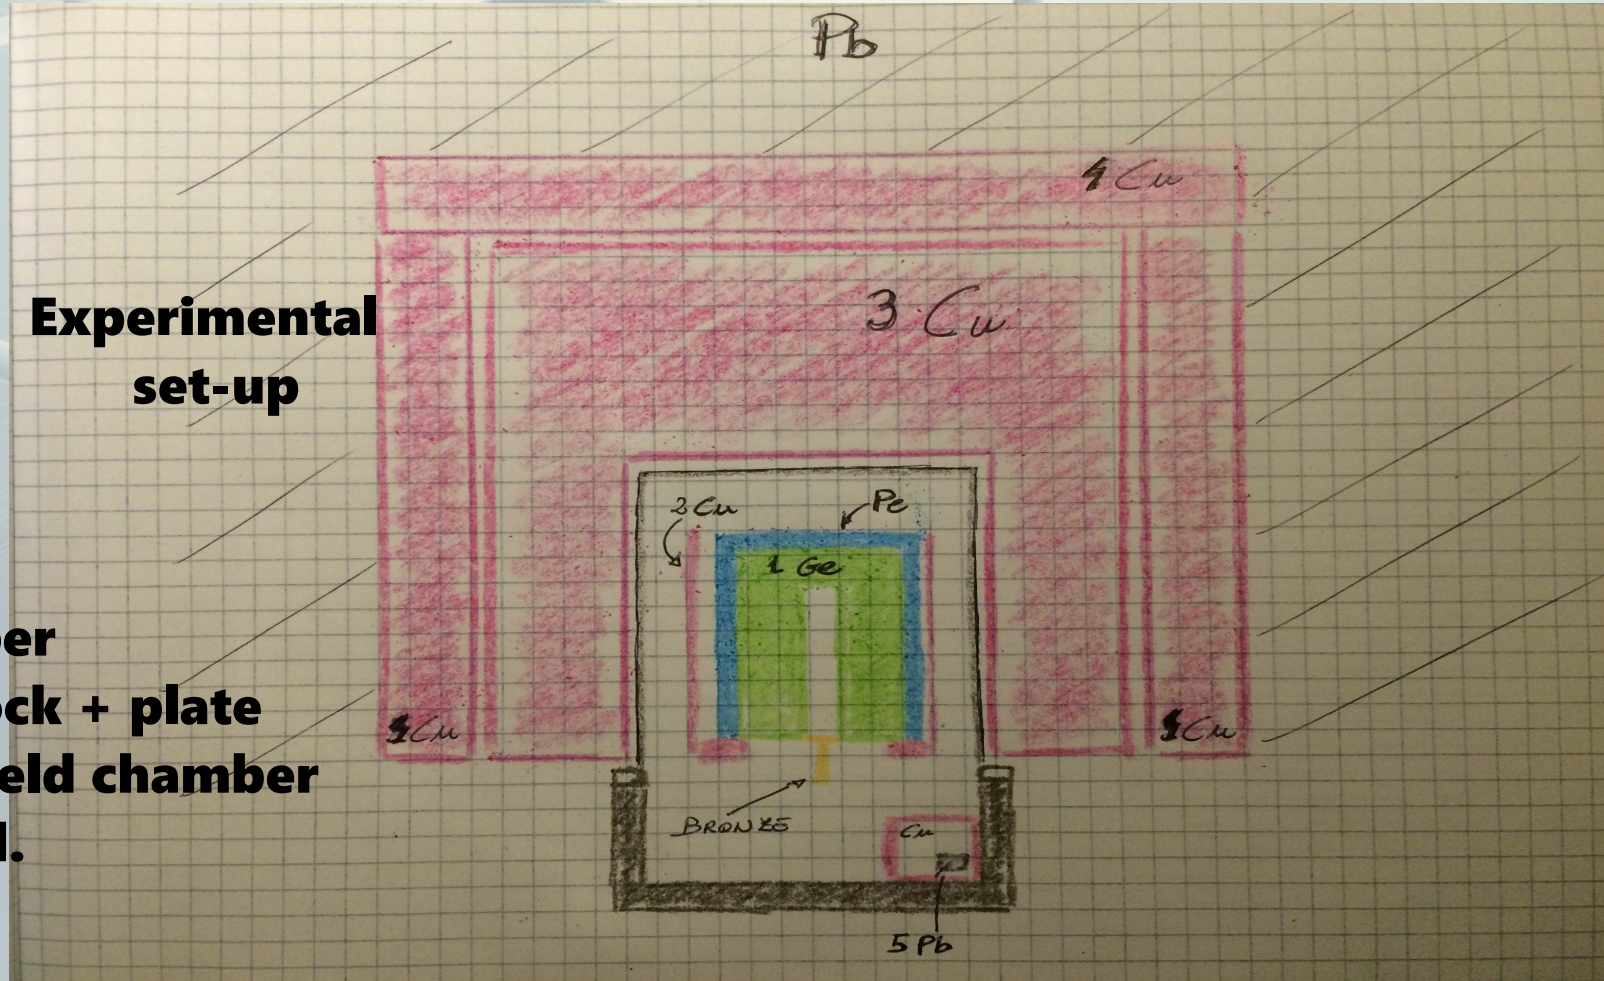

**1 = Ge crystal**

**2 = inner Copper**

**3 = Copper block + plate**

**4 = Copper shield chamber**

**5 = Lead shield.**

# Spontaneous emission including nuclear protons

The interval  $\Delta E = (35 - 49) \text{ keV}$  of the IGEX measured X-ray spectrum was fitted assuming the predicted energy dependence:

$$\frac{d\Gamma_k}{dk} = \frac{\alpha(\lambda)}{k}$$

Bayesian fit with  $\alpha(\lambda)$  free parameter.

**Fit result:**

$$\alpha(\lambda) = 148 \pm 21$$
$$\chi^2 / \text{n.d.f.} = 0.8$$

**Corresponding to the limit on the spontaneous emission rate:**

$$\lambda < 2.7 \times 10^{-13} \text{ s}^{-1}$$

Mass-proportional

**3 O. M. improvement**

**Preliminary**

# Spontaneous emission including nuclear protons

When the emission of nuclear protons is also considered, the spontaneous emission rate is:

**A. Bassi & S. Donadi**

$$\frac{d\Gamma_k}{dk} = (N_P^2 + N_e) \frac{e^2 \lambda}{4\pi^2 a^2 m_N^2 k}$$

provided that the emitted photon wavelength  $\lambda_{ph}$  satisfies the following conditions:

- 1)  $\lambda_{ph} > 10^{-15} \text{ m}$  (nuclear dimension)  $\rightarrow$  protons contribute coherently
- 2)  $\lambda_{ph} < (\text{electronic orbit radius}) \rightarrow$  electrons and protons emit independently  $\rightarrow$  NO cancellation

We consider in the calculation the 30 outermost electrons (down to 2s orbit)  $r_e = 4 \times 10^{-10} \text{ m}$  and take only the measured rate for  $k > 35 \text{ keV}$

Moreover  $BE_{2s} = 1.4 \text{ keV} \ll k_{min} \rightarrow$  electrons can be considered as *quasi-free*

# Probability distribution function of $\lambda$ experimental information

**Goal: obtain** the probability distribution function **PDF( $\lambda$ )** of the collapse rate parameter given:

- the **experimental information**

**total number of counts in the selected energy range:**

**from MC of the detector** →

mass-proportional

*2.0-M. improvement*

**J. Adv. Phys. 4, 263-266  
(2015)**

- **No mass-proportional model excluded (for white noise,  $r_c = 10^{-7}$  m)**
- **Adler's value excluded even in the mass-proportional case (for white noise,  $r_c = 10^{-7}$  m)**
