Central exclusive production of $J/\psi$ and $\psi(2S)$ mesons in pp collisions at $\sqrt{s} = 13$ TeV in LHCb

[JHEP 10 (2018) 167]

Jihyun Bhom
on behalf of the LHCb Collaboration

Institute of Nuclear Physics PAN, Cracow

13 May 2019
Outline

1. Introduction
1.1 LHCb detector
1.2 Central exclusive production

2. Results
2.1 Selections
2.2 HeRSCheL to discriminate CEP events
2.3 Purity of signal sample
2.4 Differential Cross-section

3. Summary
LHCb detector

1. Single arm spectrometer $\rightarrow$ In the forward region, $2 < \eta < 5$
2. Flexible trigger $\rightarrow$ able to trigger on low momentum objects.
3. Fixed target capability via gas injection (SMOG).
4. Run II: HeRSCheL

(a) Schematic view of the current LHCb detector
[2014 JINST 9 P12005]
VELO $-3.5 < \eta < -1.5$ and $2 < \eta < 5$.

(b) HeRSCheL (High Rapidity Shower Counters for LHCb):
new high rapidity shower counters in RunII $-10 < \eta < -5$, and $5 < \eta < 10$
Central exclusive production (CEP)

$J/\psi$ and $\psi(2S)$ in CEP are produced through the fusion of a photon and a pomeron (a colorless strongly-coupled object).

Feynman diagrams of diffractive-production mechanisms of $J/\psi$ mesons at the LHC, where the double gluon system being emitted from the beam proton constitutes the pomeron.

(a) is the pure CEP process (signal),
(b) has additional gluon radiation, and
(c) and (d) involve proton dissociation.

[JINST 13 (2018) no.04, P04017].
Central exclusive production (CEP)

1. CEP event → diffractive process of $pp \rightarrow p + X + p$
   - HeRSCheL → able to detect forward particle showers and veto events with these

(a) Inelastic pp collision.
(b) CEP elastic pp collision.
- \( 2 < \eta < 4.5, \ p_T^2 < 0.8 (\text{GeV}/c)^2 \)
- Crystal Ball func. (signal) + exponential func. (background)
  The \( J/\psi \) and \( \psi(2S) \) mass windows of the signal
  The nonresonance regions (background) \( \rightarrow \) electromagnetic CEP dimuons events
- \( J/\psi \) background : a fraction of \( 0.009 \pm 0.001 \)
- \( \psi(2S) \) background : a fraction of \( 0.161 \pm 0.018 \)
HeRSChel to discriminate CEP events

The distributions of $\chi^2_{HRC}$ (The digitised signals undergo a callibration procedure and the summed signal) for three classes of low-multiplicity-triggered events [JHEP 10 (2018) 167].

- CEP-enriched dimuons: events in the nonresonant dimuon sample ($p_T^2 < 0.01\text{GeV}^2$, a purity of 97% for electromagnetic CEP events)
- Inelastic-enriched $J/\psi$: $p_T^2 > 1\text{GeV}^2 \rightarrow$ selecting inelastic events with proton dissociation
- Good discrimination between CEP ($\log(\chi^2_{HRC}) < 3.5$) and non-CEP candidates.
- $\log(\chi^2_{HRC}) < 3.5$ Selection: $J/\psi$ signal $\rightarrow$ 14753 candidates
  $\psi(2S)$ signal $\rightarrow$ 440 candidates
HeRSCheL to discriminate CEP events

[JHEP 10 (2018) 167]

(a) $p_T^2$ distribution of $J/\psi$ candidates when data is below the HeRSCheL threshold.

(b) $p_T^2$ distribution of $\psi(2S)$ candidates when data is below the HeRSCheL threshold.

Background fractions for $J/\psi(\psi(2S))$

→ Non-resonant estimated from DiMuon mass: $0.009 \pm 0.001$

→ Feed-down estimated using data: $0.060 \pm 0.002$

→ Proton dissociation with a new technique (HeRSCheL): $0.175 \pm 0.015$
Purity of signal sample

-JHEP 10 (2018) 167]

- Signal $J/\psi$ and $\psi(2s)$ distributions as a function of $p_T^2$ obtained by subtracting proton dissociation background.
- Fit is performed to single exponential ($\exp(-b_{sig}p_T^2)$)
  Well described by $b_{sig} = 5.93 \pm 0.08 \text{GeV}^{-2}$, consistent with extrapolations from previous pp at $\sqrt{s} = 7 \text{ TeV}$ and from H1 results.
- In $0 < p_T^2 < 0.8 \text{GeV}^2$:
  $J/\psi$: $0.175 \pm 0.015$ candidate (due to proton-dissociation events)
  $\psi(2s)$: $0.11 \pm 0.06$ candidate
Purity of signal sample, Run I vs Run II

- Background level of Run II (with HeRSCheL) roughly halved compared to Run I (without HeRSCheL) analysis.

\[ pp \sqrt{s} = 13\text{TeV} \] [JHEP 10 (2018) 167]

\[ pp \sqrt{s} = 7\text{TeV} \] [J. PHYS. G41 (2014) 055002]

(a) CEP signal for the \( J/\psi \) candidates
Signal purity 0.755 ± 0.015

(b) CEP signal for the \( J/\psi \) candidates
Signal purity 0.592 ± 0.012 ± 0.030

(c) CEP signal for the \( \psi(2S) \) candidates
Signal purity 0.726 ± 0.061

(d) CEP signal for the \( \psi(2S) \) candidates
Signal purity 0.52 ± 0.07 ± 0.03
Differential Cross-section calculation

1. The differential cross-section:
\[ \frac{d\sigma}{dy} (2.0 < \eta_\mu < 4.5) = \frac{PN}{\epsilon_{\text{rec}} \epsilon_{\text{sel}} \Delta y \epsilon_{\text{single}} L_{\text{tot}}} \]

   \[ N \] : the number of selected events
   \[ \epsilon_{\text{rec}} \text{ and } \epsilon_{\text{sel}} \] : the efficiencies
   \[ P \] : the purity
   \[ \Delta y \] : the width of the rapidity bin
   \[ L_{\text{tot}} \] : the integrated luminosity
   \[ \epsilon_{\text{single}} = e^{-\mu} = 0.3329 \pm 0.0003 \] : the efficiency for selecting single interaction events.

2. Total cross-sections;
   \[ \sigma_{J/\psi \rightarrow \mu^+ \mu^-} (2 < \eta < 4.5) = 435 \pm 18(\text{stat}) \pm 11(\text{syst}) \pm 17(\text{lumi}) \text{pb} \]
   \[ \sigma_{\psi(2S) \rightarrow \mu^+ \mu^-} (2 < \eta < 4.5) = 11.1 \pm 1.1(\text{stat}) \pm 0.3(\text{syst}) \pm 0.4(\text{lumi}) \text{pb} \]

</table>

- Proton dissociation:
  Uncertainty due to imperfect modelling in the fit to $p_T^2(\mu^+\mu^-)$; determined using alternative models

- Tracking efficiency:
  Uncertainty due to variation of efficiencies determined from the calibration data sample
Differential cross-sections

(a) Compilation of photoproduction cross-sections for various experiments. The plot uses the $J/\psi$ data.

(b) Compilation of photoproduction cross-sections for various experiments. The plot uses the $\psi(2S)$ data.

- The power-law fit to H1 data [Eur. Phys. J. C 73 (2013) 2466] and it can be seen that this is insufficient to describe the $J/\psi$ data at the highest energies.
- The cross-section for the CEP of vector mesons in pp is related to the photoproduction cross-section, $\sigma_{\gamma p \rightarrow \psi p}$:
  \[ \sigma_{pp \rightarrow p\psi p} = r(W_+)k_+\frac{dn}{dk_+}\sigma_{\gamma p \rightarrow \psi p}(W_+) + r(W_-)k_-\frac{dn}{dk_-}\sigma_{\gamma p \rightarrow \psi p}(W_-) \]
  where:
  - $r$: the gap survival factor
  - $k_{\pm} \equiv M_\psi / 2e_{\pm}\gamma$: the photon energy
  - $\frac{dn}{dk_{\pm}}$: the photon flux
  - $W_{\pm}^2 = 2k_{\pm}\sqrt{s}$: the invariant mass of the photon-proton system
- Using the HERA and H1 parametrisation:
  \[ \sigma_{\gamma p \rightarrow J/\psi} = 81(W/90GeV)^{0.67} \]
Summary

1. Measurements of the central exclusive production of $J/\psi$ and $\psi(2S)$ are presented.
   - Good performance of HeRSCheL $\rightarrow$ low background level
   - Important tests of QCD in the forward region.

2. Active program to study CEP in pp, pPb and PbPb
Backup
Differential cross-section calculation, Run I vs Run II

2. Total cross-sections;

Run II, pp $\sqrt{s} = 13$ TeV

$\sigma_{J/\psi \rightarrow \mu^+\mu^-}(2 < \eta < 4.5) = 435 \pm 18(\text{stat}) \pm 11(\text{syst}) \pm 17(\text{lumi}) \text{pb}$

$\sigma_{\psi(2S) \rightarrow \mu^+\mu^-}(2 < \eta < 4.5) = 11.1 \pm 1.1(\text{stat}) \pm 0.3(\text{syst}) \pm 0.4(\text{lumi}) \text{pb}$

Run I, pp $\sqrt{s} = 7$ TeV [J. PHYS. G41 (2014) 055002];

$\sigma_{J/\psi \rightarrow \mu^+\mu^-}(2 < \eta < 4.5) = 291 \pm 7(\text{stat}) \pm 19(\text{syst}) \text{pb}$

$\sigma_{\psi(2S) \rightarrow \mu^+\mu^-}(2 < \eta < 4.5) = 6.5 \pm 0.9(\text{stat}) \pm 0.4(\text{syst}) \text{pb}$
