

## R measurement at KEDR

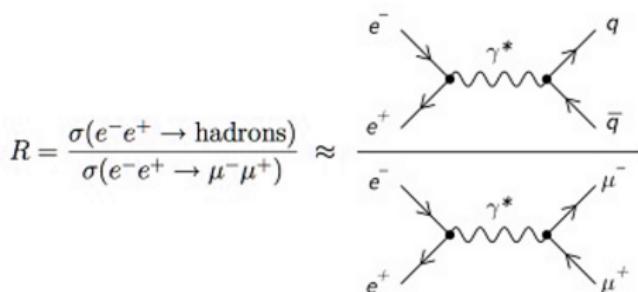

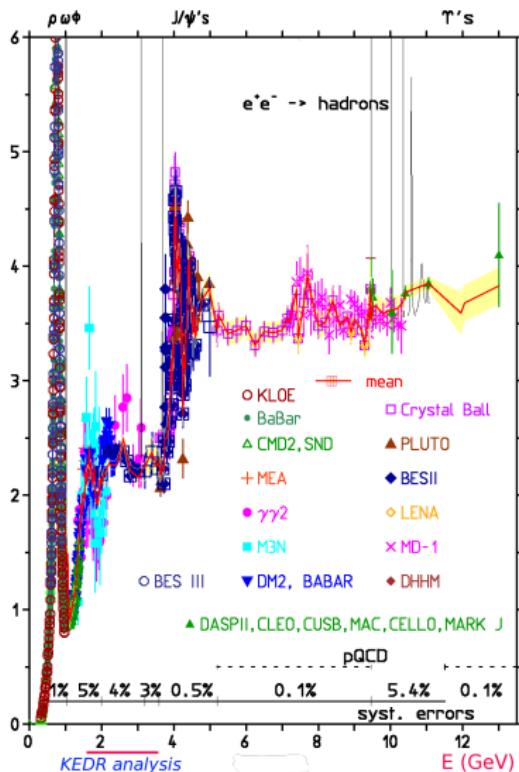

*Andrey Shamov and Korneliy Todyshev for  
KEDR collaboration*

13–17 May 2019

**The 13th International Workshop on Jeavy Quarconium**

# $R(s)$ measurement. Motivation.

In first approximation:

$$R(s) \simeq 3 \sum e_q^2$$

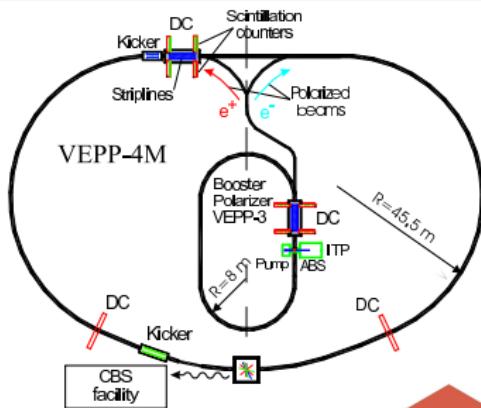

$R(s)$  is used to determine:

- $\alpha_s(s)$
- $(g_\mu - 2)/2$
- $\alpha(M_Z^2)$
- $m_Q$

F. Jegerlehner arXiv:1511.0447

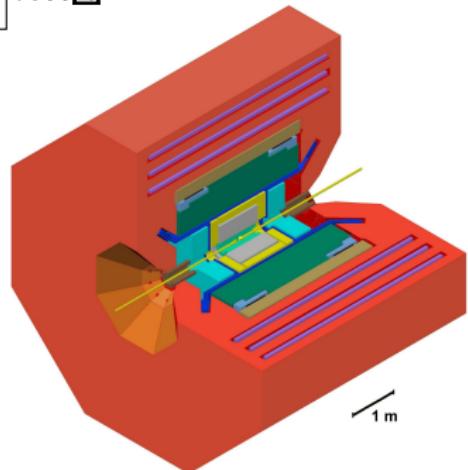

# VEPP-4M and KEDR

Beam energy  $1 \div 5 \text{ GeV}$   
Number of bunches  $2 \times 2$   
Luminosity  $1.8 \text{ GeV}$   $1.5 \times 10^{30} \text{ cm}^{-2} \text{ s}^{-1}$

## Energy measurement:

- Resonant depolarization method:  
Instant measurement accuracy  $\sim 1 \text{ keV}$   
Energy interpolation accuracy  $10 \div 30 \text{ keV}$
- Compton backscattering method  $\sim 100 \text{ keV}$

- Vertex detector
- Drift chamber
- Aerogel threshold counters
- ToF counters
- Lkr calorimeter
- Superconducting coil
- Yoke
- Muon chambers
- CsI calorimeter
- Compensating solenoid

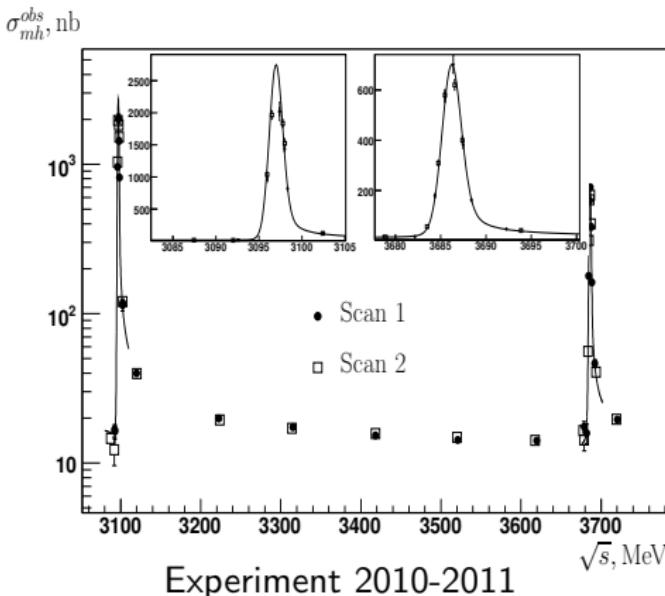

Kedr is a siberian pine somewhat similar to lebanon cedar

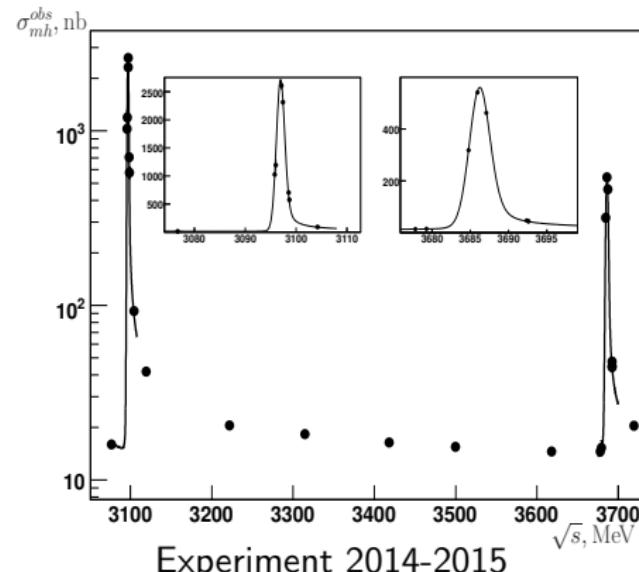

# R measurement between $J/\psi$ and $\psi(2S)$

The observed multihadron cross section as a function of the c.m. energy

Experiment 2010-2011

Experiment 2014-2015

- The c.m. energy range between 3.076 and 3.72 GeV studied
- An integrated luminosity of  $2.7 \text{ pb}^{-1}$  collected at 9 energies 3.077, 3.120, 3.223, 3.315, 3.418, 3.500, 3.521, 3.618, 3.719 GeV
- $\sim (2 - 6) \times 10^3$  m.h. events per point,  $\sim 38 \times 10^3$  in total

# Analysis

The way that we are measuring  $R$ :

$$R = \frac{\sigma_{obs}(s) - \sum \varepsilon_\psi^{tail}(s)\sigma_\psi^{tail}(s) - \sum \varepsilon_{bg}^i(s)\sigma_{bg}^i(s)}{\varepsilon(s)(1 + \delta(s))\sigma_{\mu\mu}^0}$$

with  $\sigma_{obs}(s) = \frac{N_{mh} - N_{res.bg.}}{\int \mathcal{L}_{dt}}$ , where  $N_{mh}$  represent all events pass hadronic selection criteria,  $N_{res.bg.}$  – residual machine background

$\sum \varepsilon_\psi^{tail}(s)\sigma_\psi^{tail}(s)$  is contribution from  $J/\psi$  and  $\psi(2S)$  resonances

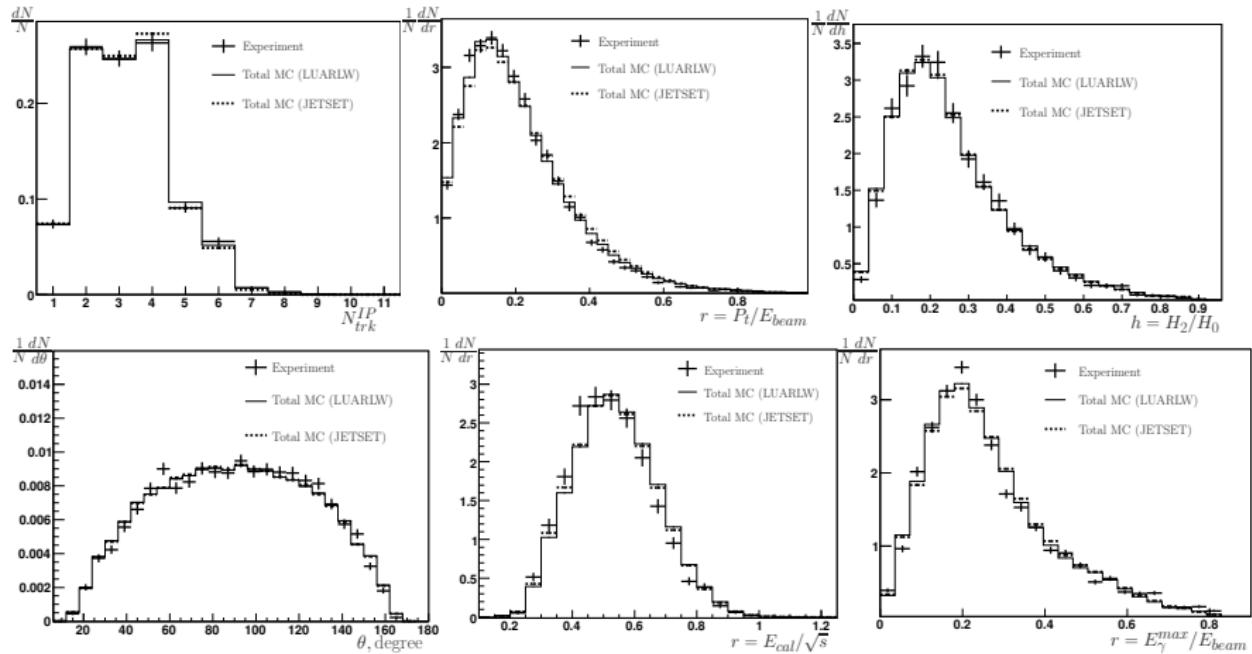

$\sum \varepsilon_{bg}^i(s)\sigma_{bg}^i(s)$  is contribution from physical processes:  $e^+e^- \rightarrow l^+l^-$ ,  $\gamma\gamma$ -processes.

$\varepsilon(s)$  – multihadron efficiency.

$$1 + \delta(s) = \int dx \frac{1}{1-x} \frac{\mathcal{F}(s, x)}{|1 - \tilde{\Pi}(s(1-x))|^2} \frac{\tilde{R}(s(1-x))\varepsilon(s(1-x))}{R(s)\varepsilon(s)}$$

$\mathcal{F}(s, x)$  – radiative correction kernel ([E.A.Kuraev, V.S.Fadin Sov.J.Nucl.Phys.41\(466-472\)1985](#))

Here  $\tilde{\Pi}$  and  $\tilde{R}$  does not includes  $J/\psi$  and  $\psi(2S)$  resonances. To determine the contributions of the  $J/\psi$  and  $\psi(2S)$  without external data, the additional data samples of about  $0.4 \text{ pb}^{-1}$ (2010-2011) and  $0.34 \text{ pb}^{-1}$ (2014-2015) were collected in the vicinity of peak regions.

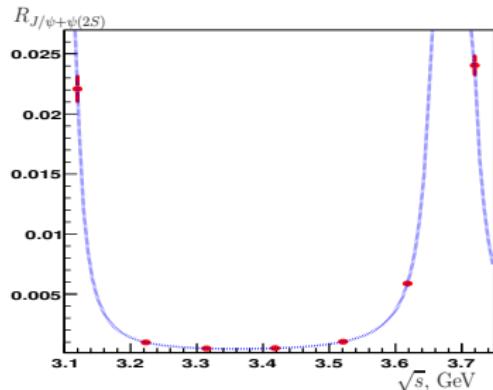

Properties of hadronic events produced in the uds continuum at 3.119 GeV (2014-2015).

Here  $N$  is the number of events,  $N^{IP}_{trk}$  is the number of tracks originated from IP,  $P_t$  is a transverse momentum of the track,  $H_2$  and  $H_0$  are Fox-Wolfram moments,  $\theta$  is a polar angle of the track,  $E_{cal}$  is energy deposited in the calorimeter,  $E_\gamma^{\max}$  is energy of the most energetic photon.

Total	$2.1 \div 7.1$

V.V. Anashin et al., Phys.Lett. B 770C, 174 (2017)

The quantity  $R$  versus the c.m. energy and the sum of the prediction of perturbative QCD and a contribution of narrow resonances.

In the c.m.energy range 3.08-3.72 GeV the weighted average  $\bar{R}_{uds} = 2.204 \pm 0.014 \pm 0.026$  is approximately one sigma higher than that theoretically expected,  $R_{uds}^{pQCD} = 2.16 \pm 0.01$  calculated according to the pQCD In the lower c.m.energy range 1.84-3.05 GeV the weighted average is  $2.225 \pm 0.020 \pm 0.047$  (the pQCD prediction of  $2.18 \pm 0.02$ ).

# An application of the $R(s)$

<b>Sum in quadrature</b>	<b>1.8</b>	<b>0.8 <math>\div</math> 1.1</b>

$$R_{uds}(s) \simeq 2 \times \left( 1 + \frac{\alpha_s}{\pi} + \frac{\alpha_s^2}{\pi^2} \times \left( \frac{365}{24} - 9\zeta_3 - \frac{11}{4} \right) \right)$$

where  $\zeta$  is the Euler-Riemann zeta function,

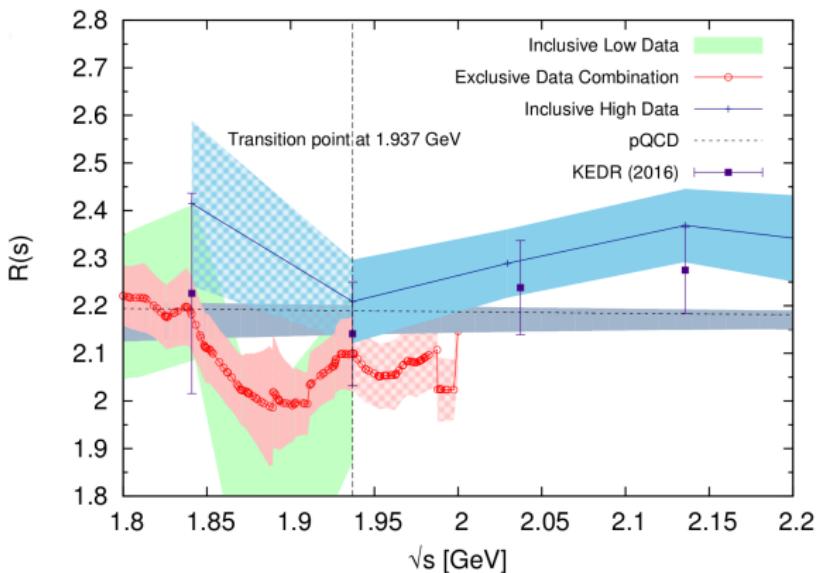

$$\begin{aligned} \alpha_s(s) = & \frac{1}{b_0 t} \left( 1 - \frac{b_1 l}{b_0^2 t} + \frac{b_1(l^2 - l - 1) + b_0 b_2}{b_0^4 t^2} \right. \\ & \left. + \frac{b_1^3(-2l^3 + 5l^2 + 4l - 1) - 6b_0 b_2 b_1 l + b_0^2 b_3^3}{2b_0^6 t^3} \right) \end{aligned}$$

with  $t = \ln \frac{s}{\Lambda^2}$ ,  $l = \ln t$  parametrized in terms of the QCD scale parameter  $\Lambda$  and coefficients  $b_0, b_1, b_3$  (can be found in PDG). To determine  $\Lambda$ , we minimise the  $\chi^2$  function

$$\chi^2 = \sum_i \sum_j \left( R_{uds}^{\text{meas}}(s_i) - R_{uds}^{\text{calc}}(s_i) \right) C_{ij}^{-1} \left( R_{uds}^{\text{meas}}(s_j) - R_{uds}^{\text{calc}}(s_j) \right),$$

The obtained value of  $\Lambda = 0.361^{+0.155}_{-0.174}$  GeV corresponds to  $\alpha_s(m_\tau) = 0.332^{+0.100}_{-0.092}$ . If the next order of pQCD is included in the expansion of  $R_{uds}$ , the fitting results are as follows:  $\Lambda = 0.437^{+0.210}_{-0.215}$  GeV and  $\alpha_s(m_\tau) = 0.378^{+0.173}_{-0.120}$ .

$\alpha_s(m_\tau)$  determined from our  $R(s)$  results is consistent with obtained in semileptonic  $\tau$  decays ( $\alpha_s(m_\tau) = 0.331 \pm 0.013$ )

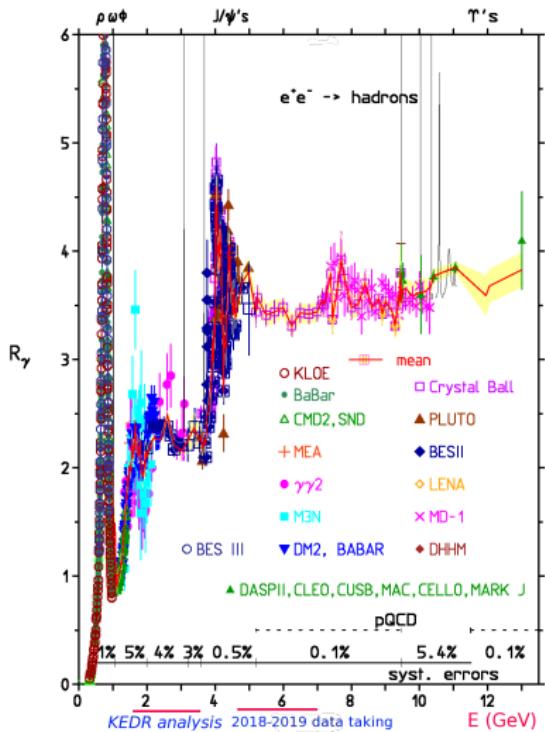

- A. Keshavarzi, D. Nomura and T. Teubner. The muon  $g - 2$  and  $\alpha(M_Z^2)$ : a new data-based analysis. Phys. Rev. D **97**, 114025 (2018). [arXiv:1802.02995].

# Outlook

R measurement in the energy range  
4.56-6.96 GeV.

- First scan finished in 2018. An integrated luminosity  $\sim 4 \text{ pb}^{-1}$  collected at 8 equidistant points with a step  $\sim 0.3 \text{ GeV}$  from 4.71 to 6.81 GeV
- In April 2019 we have started the second scan (10 equidistant points in the energy range  $4.56 \div 6.96 \text{ GeV}$ )

F. Jegerlehner arXiv:1511.0447

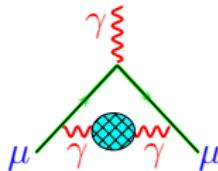

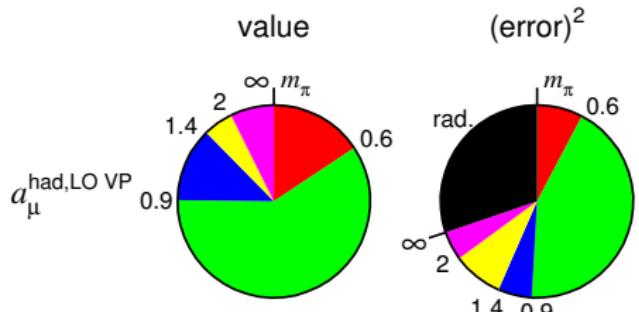

- KEDR has measured the  $R$  values at 22 center-of-mass energies between 1.84 and 3.72 GeV.
- In the energy range between 1.84 and 3.05 GeV the achieved accuracy is about or better than 3.9% at most of the energy points with a systematic uncertainty less than 2.4%.
- For the energies above  $J/\psi$  resonance the total error is about or better than 2.6% and a systematic uncertainty of about 1.9%.
- We are taking data in the energy range from 4.56 to 6.96 GeV

Thank you for your time and  
attention

# BACKUP SLIDES

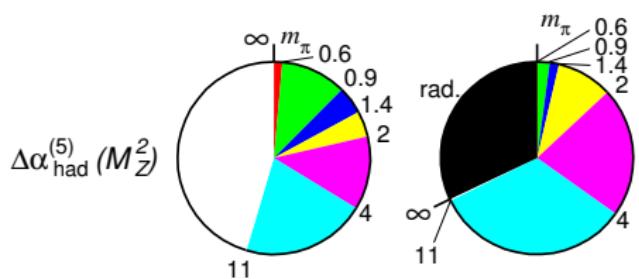

# $R$ contribution in $a_\mu$ and $\alpha(M_Z^2)$

$$a_\mu^{exp} = (g_\mu - 2)/2$$

$$a_\mu^{LO\ VP} = \frac{\alpha^2}{3\pi^2} \int_{m_\pi^2}^\infty \frac{K(s)R(s)}{s} ds$$

Low energy contributions dominate

$$\alpha(s) = \frac{\alpha}{1 - \Delta\alpha(s)}$$

$$\Delta\alpha = \sum_f \text{---} \gamma \text{---} \circlearrowleft \text{---} \gamma \text{---} = \Delta\alpha_{\text{lep}}(s) + \Delta\alpha_{\text{had}}(s)$$

$$\Delta\alpha^{(5)}(M_Z^2) = -\frac{\alpha M_Z^2}{3\pi} \operatorname{Re} \int_{m_\pi^2}^\infty \frac{R(s)ds}{s(s - M_Z^2 - i\epsilon)}$$

K.Hagiwara et al. arxiv:1105.3149

$\sigma^{e^+ e^- \rightarrow \text{hadrons}}$  and  $\sigma^{e^+ e^- \rightarrow e^+ e^-}$  nearby a narrow resonance

In the soft photon approximation analytical expression for the annihilation cross section nearby a narrow resonance.

Ya.I. Azimov et al. JETP Lett. 21 (1975) 172. With up-today modifications one has

$$\sigma^{e^+ e^- \rightarrow \text{hadr}}(s) = \sigma_{\text{continuum}}^{e^+ e^- \rightarrow \text{hadr}} + \frac{12\pi}{s} (1 + \delta_{sf}) \left[ \frac{\Gamma_{ee} \tilde{\Gamma}_h}{\Gamma M} \text{Im } f(s) - \frac{2\alpha \sqrt{R \Gamma_{ee} \tilde{\Gamma}_h}}{3\sqrt{s}} \lambda \text{Re } \frac{f^*(s)}{1 - \Pi_0} \right],$$

$$\begin{aligned} \left( \frac{d\sigma}{d\Omega} \right)^{ee \rightarrow ee} &= \left( \frac{d\sigma}{d\Omega} \right)_{\text{QED}}^{ee \rightarrow ee} + \frac{1}{s} (1 + \delta_{sf}) \left\{ \frac{9}{4} \frac{\Gamma_{ee}^2}{\Gamma M} (1 + \cos^2 \theta) \text{Im } f - \right. \\ &\quad \left. \frac{3\alpha}{2} \frac{\Gamma_{ee}}{M} \left[ (1 + \cos^2 \theta) \text{Re } \frac{f^*}{1 - \Pi_0(s)} - \frac{(1 + \cos \theta)^2}{(1 - \cos \theta)} \text{Re } \frac{f^*}{1 - \Pi_0(t)} \right] \right\}, \end{aligned}$$

Recently it was verified in the work X. Y. Zhou, Y. D. Wang and L. G. Xia, Chin. Phys. C 41 (2017) no.8, 083001

$$\delta = \frac{3}{4}\beta + \frac{\alpha}{\pi} \left( \frac{\pi^2}{3} - \frac{1}{2} \right) + \beta^2 \left( \frac{37}{96} - \frac{\pi^2}{12} - \frac{L}{72} \right), \quad L = \ln \left( s/m_e^2 \right), \quad \beta = \frac{2\alpha}{\pi} (L - 1),$$

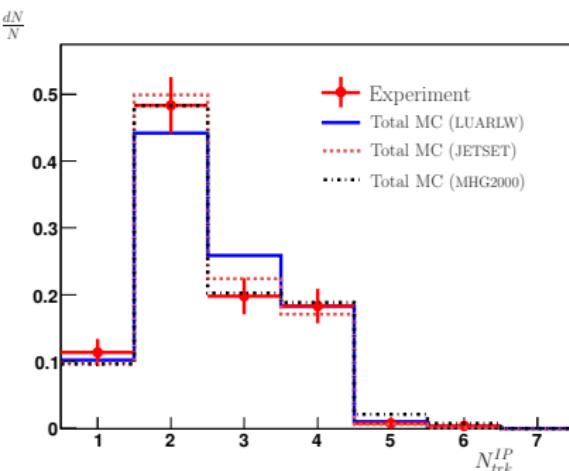

$$f(s) = \frac{\pi\beta}{\sin \pi\beta} \left( \frac{s}{M^2 - s - iM\Gamma} \right)^{1-\beta}$$

$\Gamma_{ee}$ ,  $\Gamma$ ,  $M$  – 'dressed' parameters including corrections to the vacuum polarization,  
 $\Gamma_{ee} = \Gamma_{ee}^{(0)} / |1 - \Pi_0|^2$ ,  $\lambda$ -parameter controls the resonance–continuum interference,  $\tilde{\Gamma}_h \neq \Gamma_h$

Numerical convolution with the collision energy distribution is used to fit resonance.

# Detection efficiency uncertainty in the energy range $\sqrt{s} = 1.84 \div 3.05$ GeV

- Used two essentially different MC generators (LUARLW and tuned JETSET)
- We validated our estimate of the systematic uncertainty related to simulation of the  $uds$  continuum using an unfolding method (Chinese Physics C Vol. 37, No. 6 (2013) 063001).
- The estimate at the most problematic energy point 1.84 GeV was additionally verified using the exclusive generator MHG2000.

Detection efficiency uncertainties obtained by different methods

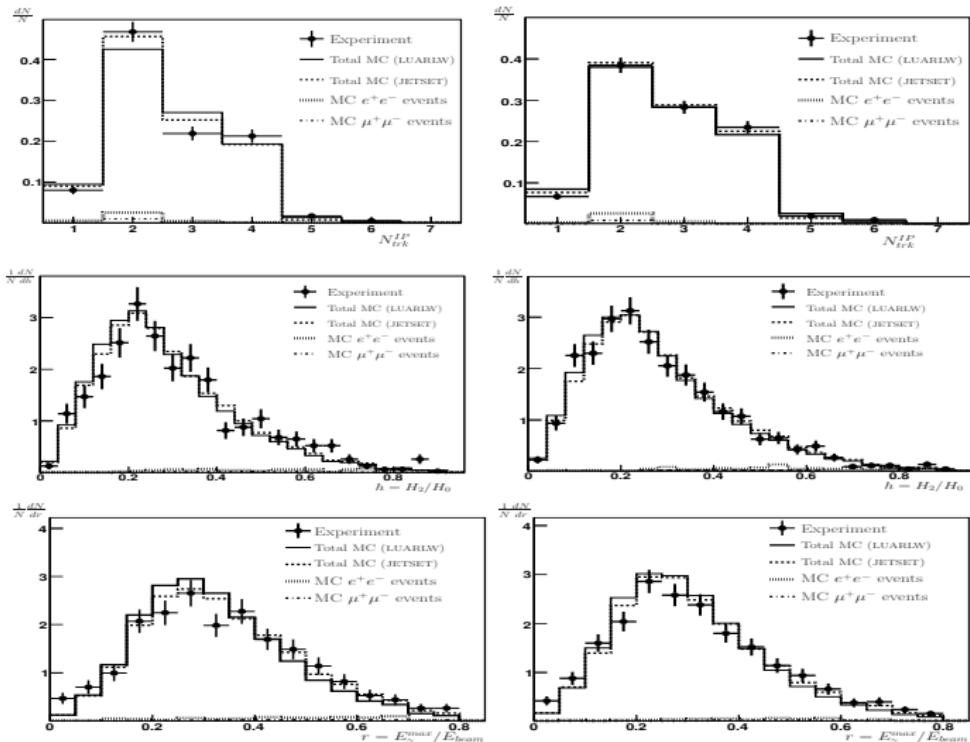

Energy, MeV	$\delta\epsilon/\epsilon$		
	LUARLW	Unfolding JETSET method	LUARLW MHG2000
1841.0	6.6%	3.6%	3.8%
1937.0 $\div$ 2135.7	2.5%	1.9%	-
2135.7 $\div$ 3048.1	1.2%	0.5%	-

# Selection criteria

# Simulation at 1.94 and 2.14 GeV: JETSET and LUARLW

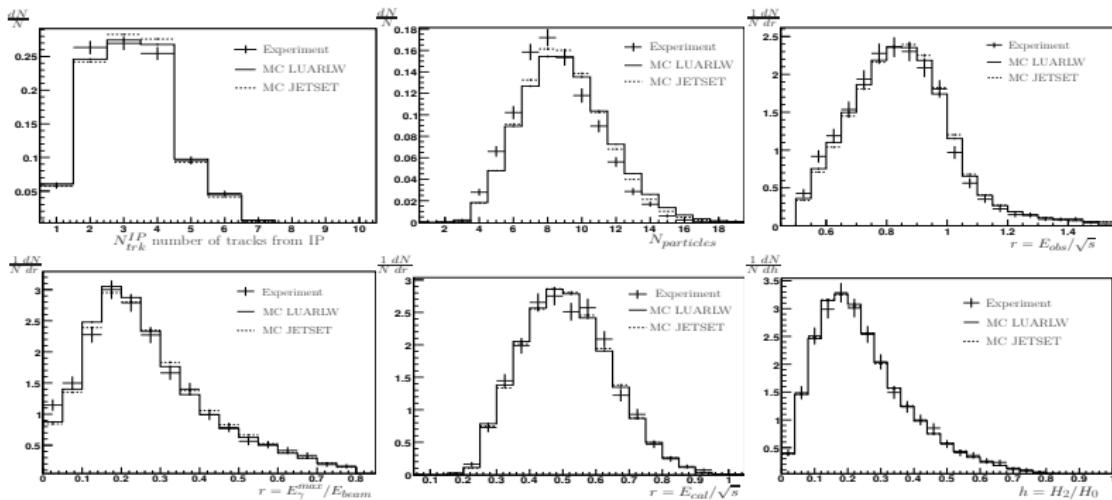

Properties of hadronic events produced in uds continuum at 1.94 GeV (left) and 2.14 GeV (right). Here,  $N$  is the number of events,  $H_2$  and  $H_0$  are Fox-Wolfram moments,  $E_\gamma^{\max}$  is energy of the most energetic photon,  $N_{trk}$  is the number of tracks in event.

# Simulation at 1.94 and 2.14 GeV: JETSET and LUARLW

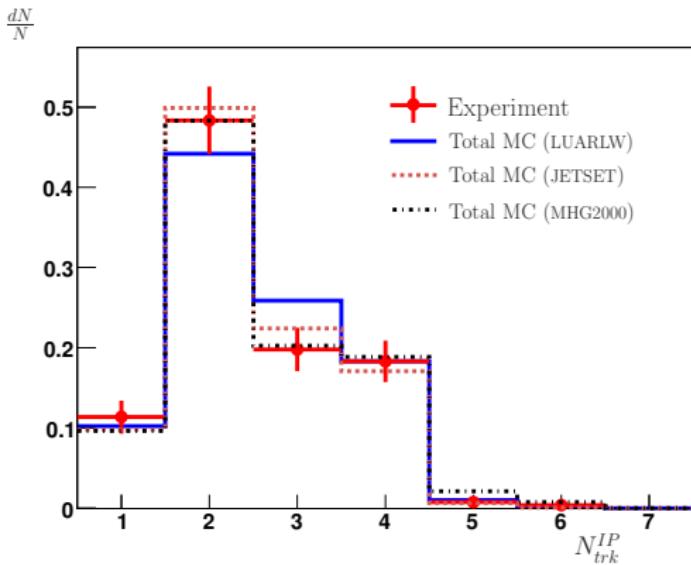

Properties of hadronic events produced in uds continuum at 1.94 GeV (left) and 2.14 GeV (right). Here,  $N$  is the number of events,  $E_{\text{cal}}$  is energy deposited in the calorimeter,  $\theta$  is polar angle,  $N_{\text{trk}}$  is the number of tracks in event. Integrals of all distributions are normalized to unity.

# Simulation at 3.12 GeV: JETSET and LUARLW

Properties of hadronic events produced in uds continuum at 3.12 GeV. Here  $N$  is the number of events,  $H_2$  and  $H_0$  are Fox-Wolfram moments. Integrals of all distributions are normalized to unity.

# Simulation at 1.84 GeV: JETSET, LUARLW and MHG2000

To obtain the detection efficiency required for calculation of the radiative correction, we performed simulation of the hadronic events using LUARLW and the event generator MHG2000 developed by the CMD-3 collaboration. MGH2000 generates about 30 exclusive channels accounting for the resonance production below 1.9 GeV.

# Luminosity determination: 3.12-3.72 GeV

$e^+e^- \rightarrow e^+e^-(\gamma)$  events detected by the LKr calorimeter  $41^\circ < \theta < 159^\circ$  and CsI calorimeter  $20^\circ < \theta < 32^\circ$  and  $148^\circ < \theta < 160^\circ$

Systematic uncertainties of the luminosity determination in %.

Source	Uncertainty, %
Calorimeter response	0.7
Calorimeter alignment	0.2
Polar angle resolution	0.2
Cross section calculation	0.5
Background	0.1
MC statistics	0.1
Variation of cuts	0.6
Sum in quadrature	1.1

Differences of an integrated luminosities obtained using the LKr and CsI calorimeters in two scans are  $0.5 \pm 0.5\%$  and  $0.0 \pm 0.5\%$ , respectively.

## Correction to residual machine background: 3.12-3.72 GeV

- The contribution of residual machine background was estimated using runs with separated  $e^+$  and  $e^-$  bunches.
- The residual background was evaluated and subtracted using the number of events which passed selection criteria in the background runs in the assumption that the background rate is proportional to the beam current and the measured vacuum pressure.
- As alternative we assumed that background rate is proportional to the current only. The difference between the numbers of background events obtained with the two assumption was considered as the uncertainty estimate for given energy point.

The residual machine background in % of observed cross section

Point	Scan 1	Scan 2
1	$1.3 \pm 0.2 \pm 0.4$	$1.3 \pm 0.2 \pm 0.4$

# Unfolding method

- An efficiency matrix  $\epsilon_{ij}$  describes the efficiency of an event generated with  $j$  charged tracks to be reconstructed with  $i$  charged tracks.
- The distribution of the number of observed charged track events in data,  $N_i^{obs}$ , is known. The true multiplicity distribution in data can be estimated from the observed multiplicity distribution in data and the efficiency matrix by minimizing the  $\chi^2$ .
- 

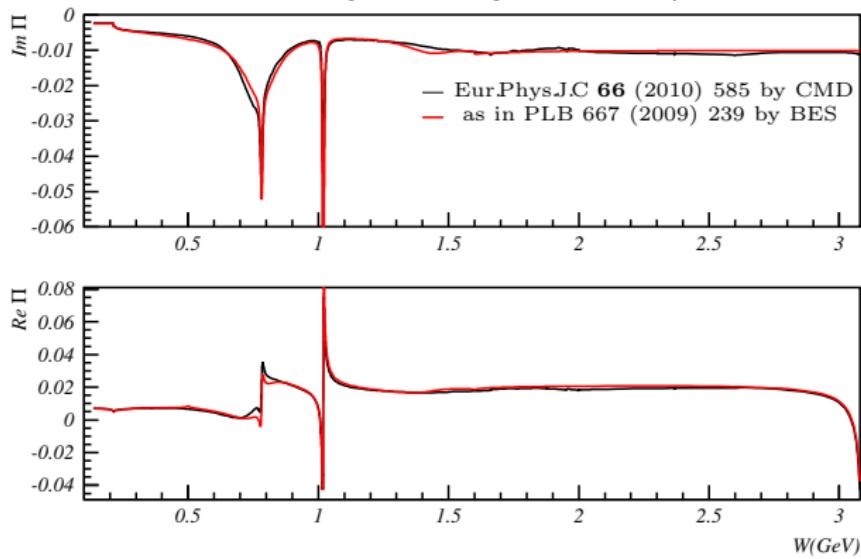

$$\chi^2 = \sum_{i=1}^{i=8} \frac{N_i^{obs} - \sum_{j=1}^{j=8} \epsilon_{ij} \times N_j}{N_i^{obs}}$$

where the  $N_j$  ( $j = 0, 2, 4, 6, 8$ ) describe the true multiplicity distribution in data and are taken as floating parameters in the fit.

- The total «true» number of events in data can be obtained by summing all fitted  $N_j$ .

# pQCD calculation

$R(s)$ , obtained in:

P.A.Baikov *et al.* Nucl. and Part. Phys. Proceed. 261-262(2015):

$$R^{n_f=3}(s) = 2 \left[ 1 + \frac{\alpha_s}{\pi} + 1.6398 \left( \frac{\alpha_s}{\pi} \right)^2 - 10.2839 \left( \frac{\alpha_s}{\pi} \right)^3 - 106.8798 \left( \frac{\alpha_s}{\pi} \right)^4 \right].$$

$\alpha_s$  obtained in K.G.Chetyrkin, B.A.Kniehl, M.Steinhauser PRL 79 (1997)

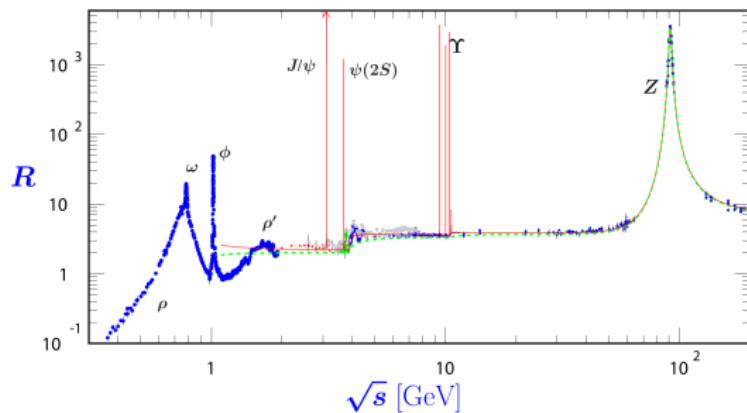

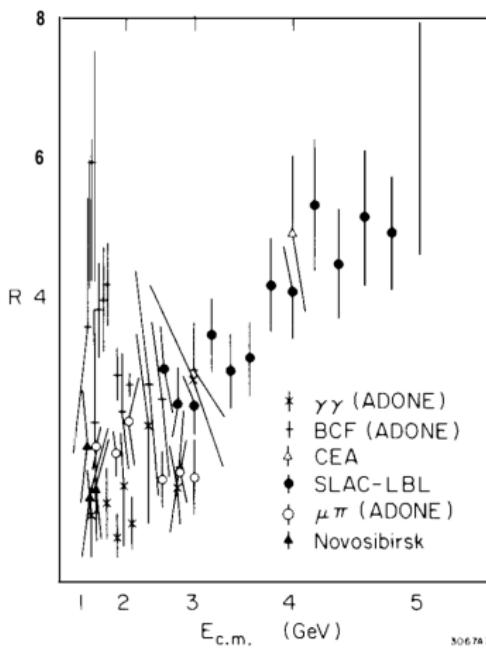

$$\begin{aligned} \alpha_s &= \frac{1}{\beta_0 L} - \frac{1}{(\beta_0 L)^2} \frac{\beta_1}{\beta_0} \ln L + \frac{1}{(\beta_0 L)^3} \left[ \left( \frac{\beta_1}{\beta_0} \right)^2 (\ln^2 L - \ln L - 1) + \frac{\beta_2}{\beta_0} \right] \\ &\quad + \frac{1}{(\beta_0 L)^4} \left[ \left( \frac{\beta_1}{\beta_0} \right)^3 \left( -\ln^3 L + \frac{5}{2} \ln^2 L + 2 \ln L - \frac{1}{2} \right) - 3 \frac{\beta_1 \beta_2}{\beta_0^2} \ln L + \frac{\beta_3}{2 \beta_0} \right] \end{aligned}$$

$$\text{for } n_f = 3, \beta_0 = \frac{9}{4}, \beta_1 = 4, \beta_2 = \frac{3863}{384}, \beta_3 = \frac{445}{32} \zeta(3) + \frac{140599}{4608}, L = \ln^2 \frac{Q^2}{\Lambda^2_{MS}}$$

$\alpha_s(m_\tau^2) = 0.331 \pm 0.013$  (A.Pich Nucl. and Part. Phys. Proceed. 260 (2015) 61-69) allow to get  $R_{uds}^{pQCD} = 2.16 \pm 0.01$  in energy range  $3.1 \div 3.7$  GeV.

# $R(s)$ measurement. Motivation.

PDG at the present time.

“The ratio  $R$  as of July 1974”  
Presented by Richter at the  
London Conference in July 1974.
