## JLAB12

## Peculiar features of The JLAB accelerator facility:

**Polarized electrons** with E up to 12 GeV

Hybrid ring-linear structure and fast acceleration

--> **continuous beam with high luminosity** (e.g.  $10^{35} \text{ s}^{-1} \text{ cm}^{-2}$  on a 5 cm LH2 target)

--> **High statistics of rare events** (e.g. proton form factors pushed to several GeV)

**p, d (n), nuclear targets both long and transversely polarized.**

**4 experimental halls A, B, C, D simultaneously taking data**

--> **great variety of measurements.**

# JLAB12 Experiment

## The physics program

### \*Nucleon Structure

- EM, EW, and Flavor-Separated Form Factors
- Structure functions
- Transverse Momentum Distributions (TMD)

### \*The Physics of Confinement

- Baryon spectroscopy
- Meson spectroscopy

### \*Nuclear Structure and the Quark Structure of Nuclei

- Hypernuclear Physics
- Lead radius

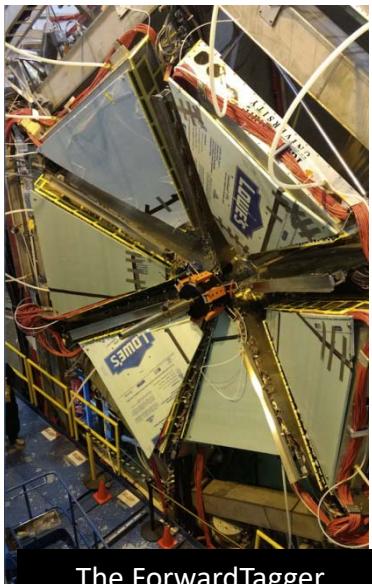

### \*Search for physics Beyond the Standard Model

- Dark Forces search, light Dark Matter at accelerators
- Weak couplings measurement

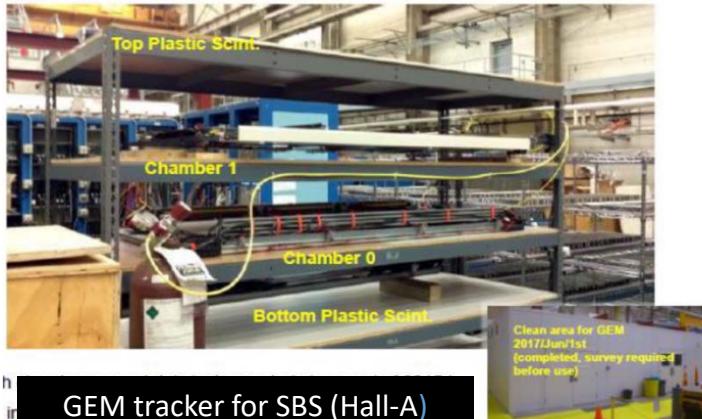

JLAB12, 67 scientists (~42 FTE, 11 INFN Units) is supporting the JLab broad experimental program in Hall-A and Hall-B

INFN theoretical community, 30 scientists involved in JLAB12 physics is supporting the experimental effort

JLAB12 activity is linked to the hadron physics experiments in Europe: HPH, ALICE, COMPASS, PANDA

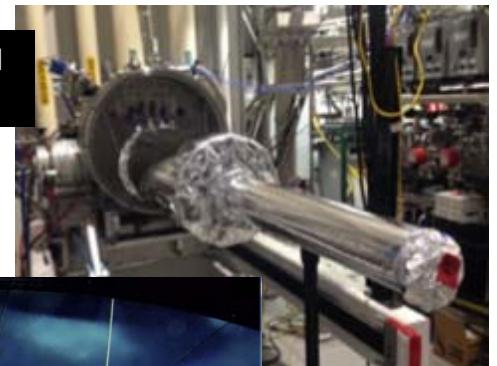

The ForwardTagger installed in CLAS12

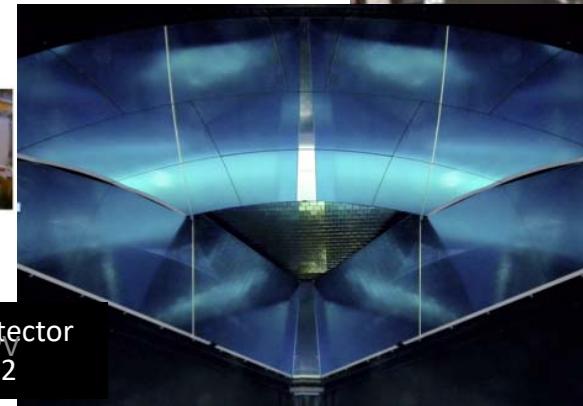

GEM tracker for SBS (Hall-A)

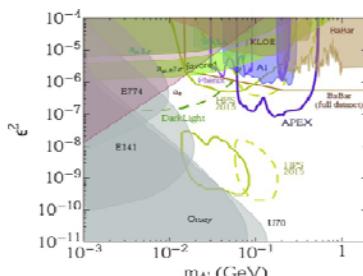

The HD polarized target for Hall-B

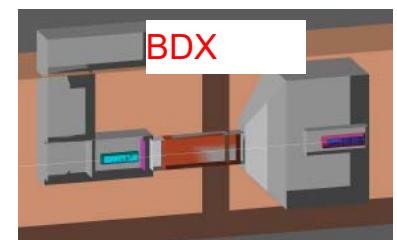

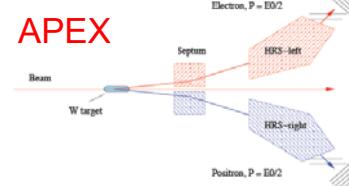

10/7/2018 CERN-INFN-PV  
The RICH-I detector for CLAS12

## Light Dark Matter Searches

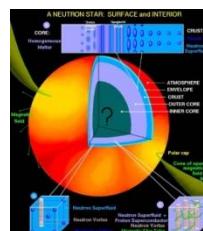

Heavy photon search through its  $e^+ e^-$  decay

Beam dump experiments

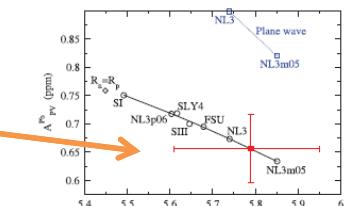

## Physics of Nuclei

Measurement of neutron radius in Lead has connection with Neutron stars crust thickness, Existence of exotic cores in Neutron stars, Neutron star way of cooling.

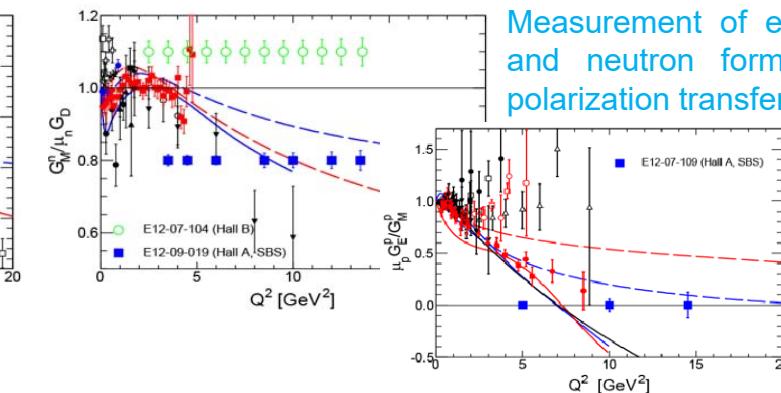

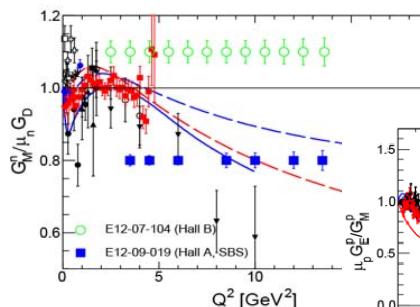

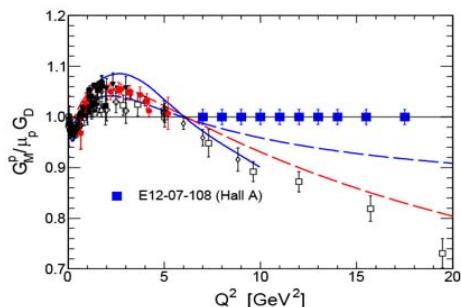

PREX has been the first model independent measurement of a neutron skin in a nucleus (Lead).

PREX-II will complete PREX measurement.

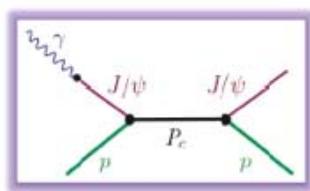

## Structure of the nucleon

Measurement of electric and magnetic proton and neutron form factors at large  $Q^2$  via polarization transfer

## Hadron Spectroscopy

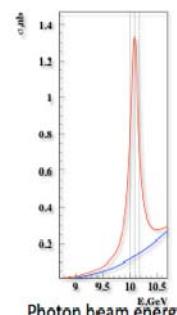

Search for LHCb  
pentaquark

$$\gamma + p \rightarrow P_C \rightarrow J/\psi + p$$

$$J/\psi \rightarrow e^+ e^-$$

$$J/\psi \rightarrow \mu^+ \mu^-$$

2018 CERN-NFN-PV

	$P_c(4380)$		$P_c(4450)$	
	Minimum	Maximum	Minimum	Maximum
Untagged mode	48	500	70	220
Tagged mode	20	600	28	880
Total	68	1100	98	1100

98 events/day for narrow  $P_c(4450)$   
pentaquark state at nominal CLAS12  
luminosity

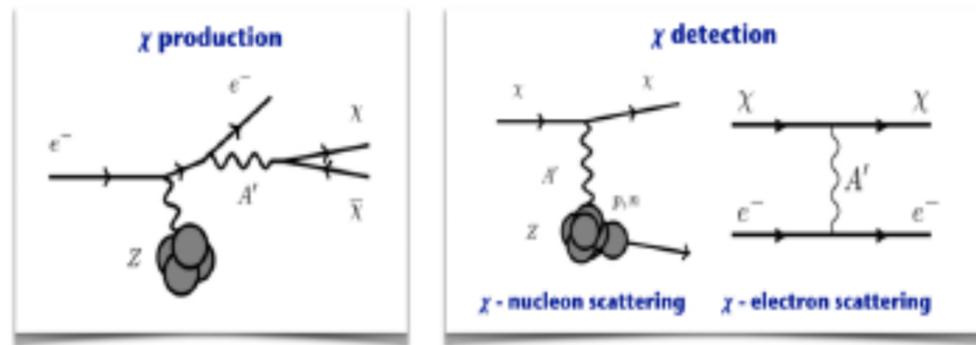

# attività prevista - PV

- (LIGHT) DARK MATTER search

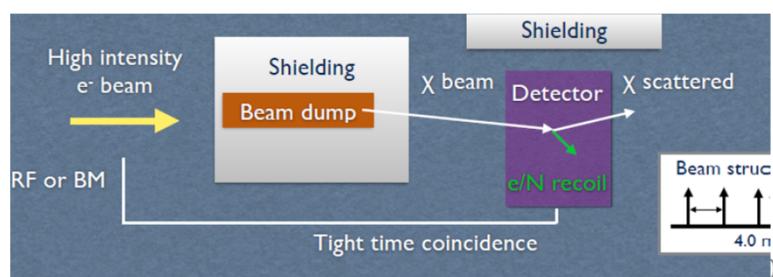

Beam Dump eXperiment (BDX) → search for light DM particles ( $\chi$ ) with mass < 1 GeV): ...

A dark photon produced by electron bremsstrahlung in a beam dump would decay into a pair of light dark matter particles ( $\chi$ ) (“invisible decay” complementary to the “visible” decay into  $e^+e^-$  pairs).

The dark matter beam will cross undisturbed the beam-dump, then a fraction would scatter off nucleons or electrons in the detector volume via a dark photon exchange.

The  $\chi$ -proton scattering will produce a slow recoil proton with ~MeV energy whereas the  $\chi$ -electron scattering will give rise to an electromagnetic shower generated by a GeV recoil electron. BDX aims to measure both signals by using an electromagnetic calorimeter

$10^{22}$  electrons-on-target at 12 GeV in a one-year period

# attività prevista - PV

## \* Meson spectroscopy (CLAS12)

p continuously converts into p + virtual meson

e + p  $\rightarrow$  e + virtual meson + slow p  $\rightarrow$  special meson + slow p  
 $\rightarrow$  selected final products + slow p

Searching states with quantum numbers not predicted by only-quark model

prese dati + analisi dati + attività di servizio (calibrazioni, referaggi interni, software generale, ...)
