# Studies of ISR process $e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma$ at $\sqrt{s} \approx m_{\phi}$ Status report 

## B. Cao

Uppsala University \& KLOE-2 collaboration

September 23, 2018

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Overview

(1) Hadron physics
(2) Analysis

- Data \& MC status
- Background rejection
- MC-Data comparison
(3) Results
- Differential Cross Section
- Total cross section
(4) Summary
(5) Appendix

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Physics

## Rare decays

| meson $\left(J^{P C}\right)$ | quark content | mass $\mathrm{MeV} / c^{2}$ | decay modes $(>5 \%)$ |
| :---: | :---: | :---: | :---: |
| $\phi\left(1^{--}\right)$ | $s \bar{s}$ | $1019.461 \pm 0.019$ | $K^{+} K^{-}(48.9 \pm 0.5 \%)$ |
|  |  | $K_{L}^{0} K_{S}^{0}(34.2 \pm 0.4 \%)$ |  |
| $\omega\left(1^{--}\right)$ | $\frac{u \bar{u}+d \bar{d}}{\sqrt{2}}$ | $782.65 \pm 0.12$ | $\pi^{+} \pi^{-} \pi^{0}(15.32 \pm 0.32 \%)$ |

$\operatorname{BR}(\phi \rightarrow \omega \gamma)<5 \%, \mathrm{CL}=84 \%$ J.S. Lindsey et al, PR 147 (1966) 913 (bubble chamber).

## Hadron production

## Hadron cross section

Total hadronic cross section (top), hadronic ratio (bottom).

$$
\begin{equation*}
R_{\text {hadron }}=\frac{\sigma\left(e^{+} e^{-} \rightarrow \gamma^{*} \rightarrow \text { hadrons }\right)}{\sigma_{0}\left(e^{+} e^{-} \rightarrow \mu^{+} \mu^{-}\right)} \tag{1}
\end{equation*}
$$

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Data \& MC status

$\pi^{+} \pi^{-} \pi^{0} \gamma$ MC sample from $\phi \rightarrow \rho \pi$ physics, MC sample "all_physics" is dedicated for $K_{S} K_{L}$ analysis

| Year | First run | Last run | $\sqrt{s}$ | $\int \mathcal{L}\left[\mathrm{pb}^{-1}\right]$ |
| :---: | :---: | :---: | :---: | :---: |
| 2004 | 30300 | 34169 | $M_{\phi}$ | 535.42 |
| 2005 | 34280 | 41902 | $M_{\phi}$ | 1201.68 |

| Streams Code | MC_CARD_ID | MC_Code | Stream_ID | Stream_Code | Version | LSF |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Event Selection

## Pre-selections

- At lest two tracks with opposite curvature.
- Neutral clusters with $|\cos \theta|<0.92, \theta_{\text {min }}=23^{\circ}$, number of in time clusters $n_{\text {clus }} \geq 2$ with
$t_{\text {clu }}-\frac{R_{\text {clu }}}{c}<\min \left(2,5 \sigma_{t}\right) \mathrm{ns}$. $\sigma_{t}=\frac{0.057}{\sqrt{E(\mathrm{GeV})}} \oplus 0.14 \mathrm{~ns}$.

## Additional selections

- $K_{L} K_{S}$ stream cuts, FILFO
- Exact two prompt neutral cluster (pnc) with $E_{\text {pnc }} \geq 15$ MeV .
- Exact two tracks with opposite curvature that are extrapolated inside a cylinder with $\rho=\sqrt{x^{2}+y^{2}}<5 \mathrm{~mm}$ and $|z|<5 \mathrm{~mm}$.

Selection of $e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma$

- $\pi^{+}, \pi^{-}$and $\pi^{0}$ in final states.
- Select ISR photon candidates which are not associated with primary vertex.

Simulated ISR photon energy distribution.
Total number of generated events $N_{\text {gen }}=$ 310559 generated events.

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## 7C Kinematic fit

## 7C Kinematic fit

- Energy and momentum conservation with additional Time-of-Fight (ToF) resulting 7 constraints on final state particles.
- $\chi_{7 \mathrm{C}}^{2}$ distribution with $\mathrm{ndf}=7$, fitted observables are cluster energy $E_{\text {clu }}$, position $x, y, z$ and ToF $t_{\text {clu }}$. Total 15 observables.

## Error parametrization

- If $\sqrt{x^{2}+y^{2}}>200 \mathrm{~cm}$ (barrel), $\sigma_{x y}=1.2 \mathrm{~cm} \& \sigma_{z}=\frac{1.4}{\sqrt{E(\mathrm{GeV})}} \mathrm{cm}$,
- If $\sqrt{x^{2}+y^{2}}<200 \mathrm{~cm}$ (end-cap), $\sigma_{x z}=1.2 \mathrm{~cm} \& \sigma_{y}=\frac{1.4}{\sqrt{E(\mathrm{GeV})}} \mathrm{cm}$.
- $\frac{\sigma_{E_{\gamma}}}{E_{\gamma}}=\frac{5.7 \%}{\sqrt{E(\mathrm{GeV})}}$.
- $\sigma_{t}=\frac{57 \mathrm{ps}}{\sqrt{E(\mathrm{GeV})}} \oplus 147 \mathrm{ps}$.

$\chi_{7 \mathrm{C}}^{2}$ distribution, all selection cuts are applied with $\chi_{7 \mathrm{C}}^{2}$ less than 500 .

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## $\pi^{0}$ photon selection

The $\chi_{\gamma \gamma}^{2}$ is calculated from objective function

$$
\begin{equation*}
\chi_{\gamma \gamma}^{2}=\frac{\left(m_{\gamma \gamma}-m_{0}\right)^{2}}{\sigma_{\gamma \gamma}^{2}}, \tag{2}
\end{equation*}
$$

where $m_{0}$ is the true value of $\pi^{0}$ mass. Energy dependent relative error $\frac{\sigma_{\gamma \gamma}}{m_{\gamma \gamma}}$ is calculated using unconstrained energies $E_{1,2}$ and corresponding uncertainties $\sigma_{1,2}$

$$
\begin{equation*}
\frac{\sigma_{\gamma \gamma}}{m_{\gamma \gamma}}=\frac{1}{2} \sqrt{\left(\frac{\sigma_{1}}{E_{1}}\right)^{2}+\left(\frac{\sigma_{2}}{E_{2}}\right)^{2}} \tag{3}
\end{equation*}
$$

The test is performed event wise, all three combinations are tested and photon pair with the lowest $\chi_{\gamma \gamma}^{2}$ is chosen to be the best $\pi^{0}$ photon pair candidates. A study of $\phi \rightarrow \eta \gamma$
 MC sample with high statistics shows shift on reconstructed $3 \pi$ and paired photon $2 \gamma$ invariant mass spectrum due to miss matched $\pi^{0}$ photon pairs.

Invariant mass of paired photons $\mathrm{M}_{\gamma \gamma}$. $\sigma_{\gamma \gamma}=2.75 \mathrm{MeV} / \mathrm{c}^{2}$ is determined from $\pi^{+} \pi^{-} \pi^{0} \gamma$ sample. App.1.

## Background rejection

$$
\chi^{2}<20
$$

Signal background ratio $S / B$ vs $\chi_{7 C}^{2}$ cuts (left), $\chi_{7 C}^{2}$ distribution (right).

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Background rejection

$$
\left|p_{+}\right|+\left|p_{-}\right|<390 \mathrm{MeV} / \mathrm{c}
$$

Momenta sum of charge tracks $\left|p_{+}\right|+\left|p_{-}\right|$after $\chi_{7 \mathrm{C}}^{2}$ cut (left). Invariant mass of $\pi^{+} \pi^{-} \pi^{0}$ distribution after $\chi_{7 \mathrm{C}}^{2}$ and track momentum cuts (right).

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## MC-Data comparison

Invariant mass of $\pi^{+} \pi^{-} \pi^{0}$ distribution $M_{3 \pi}$ in $\omega$ mass region before scaling (left), after scaling (right), residual MC background includes $K_{S} K_{L}, K \bar{K}$ and $\rho \pi$. Fitting range $\mathrm{M}_{3 \pi} \in[4001020] \mathrm{MeV} / \mathrm{c}^{2}$. Maximum likelihood fitting is applied to obtain scaling factor $\hat{w}$.

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Efficiencies

Selection efficiency at $i^{\text {th }}$ mass bin $\Delta M_{3 \pi, i}$ is calculated using $\varepsilon_{i}=\frac{N_{\mathrm{rec}, i}}{N_{\text {gen }, \mathrm{i}}}$ where $N_{\mathrm{rec}, i}$ and $N_{\text {gen }, i}$ are number of reconstructed and generated $\pi^{+} \pi^{-} \pi^{0} \gamma$ events, the error is calculated using $\sigma_{\varepsilon}=\sqrt{\varepsilon(1-\varepsilon) / N_{\text {gen }}}$. The global efficiency $\varepsilon \sim 0.0090 \pm 0.0002$ due to rejection of small ISR energy photons associated to $e^{+} e^{-} \rightarrow \phi \gamma \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma$ events Fig.8.

Simulated $\pi^{+} \pi^{-} \pi^{0}$ invariant mass $\mathrm{M}_{3 \pi}$.

Efficiency $\varepsilon$ as a function of $\pi^{+} \pi^{-} \pi^{0}$ invariant mass $\mathrm{M}_{3 \pi}$.

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Cross Section

Differential cross section is measured according to
$\frac{\mathrm{d} \sigma\left(e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma\right)}{\mathrm{d} m}=\frac{\mathrm{d} N / \mathrm{d} m}{\varepsilon L}$.
$N_{\text {obs }} / \Delta M_{3 \pi}$ is measured $d N / \mathrm{d} m$ corrected by efficiency $\varepsilon$ where $N_{\text {obs }}=N_{\text {sel }}-N_{\text {bkg }}$ is observed number of $\pi^{+} \pi^{-} \pi^{0} \gamma$ in mass interval $\Delta M_{3 \pi}$ with a choice $1.4 \sigma_{3 \pi} \sim 3.4 \mathrm{MeV} / \mathrm{c}^{2} . N_{\text {sel }}$ and $N_{\text {bkg }}$ are number of selected data and MC back ground events survived after all selection cuts. $L$ is integrated total luminosity.

Observed number of $\sigma\left(e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0}\right)$ events $N_{\text {obs }}$ as function of invariant mass of $\pi^{+} \pi^{-} \pi^{0}$ system.

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Cross Section

The visible cross section

$$
\begin{equation*}
\sigma_{\mathrm{vis}}=\int_{0}^{x_{\max }} \epsilon(s, x) W(s, x) \sigma_{0}(s(1-x)) d x \tag{5}
\end{equation*}
$$

$\sigma_{\text {vis }} \equiv \sigma\left(e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0}\right)$ measurement of Born cross section $\sigma_{0}$ associates to differential cross section in Eq. 4 through

$$
\begin{equation*}
\sigma_{\mathrm{vis}}=\frac{\mathrm{d} N / \mathrm{d} m}{\varepsilon \mathrm{~d} L / \mathrm{d} m} \tag{6}
\end{equation*}
$$

where $\mathrm{d} L / \mathrm{d} m$ is measured using $W\left(s, M_{3 \pi}\right) \frac{2 M_{3 \pi}}{s} L, x \equiv 2 E_{\gamma} / \sqrt{s}$ is ISR emission fraction

$$
\begin{equation*}
E_{\gamma}=\frac{\sqrt{s}}{2}\left(1-\frac{M_{3 \pi}^{2}}{s}\right) \tag{7}
\end{equation*}
$$

with $\sqrt{s} \approx 1.02 \mathrm{GeV}, E_{\gamma} \approx 209 \mathrm{MeV}$ when $\omega$ is produced. $M_{3 \pi}$ is known as effective c.m. energy $\sqrt{s^{\prime}} . W(s, x)$ is the radiator function.

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Cross Section

Observed total cross section $\sigma$ for $e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0}$ (dot), Breit-Wigner Parametrization (red solid).

## Total cross section

TABLE III. $e^{+} e^{-}$effective c.m. energy $\sqrt{s^{\prime}}$, number of observed events $N_{\text {obs }}$, detection efficiency $\varepsilon$, differential ISR luminosity $L$ and measured total cross section $\sigma$ for $e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0}$. All values are calculated in the mass range $M_{3 \pi} \in[730820] \mathrm{MeV} / \mathrm{c}^{2}$ with a bin width $3.4 \mathrm{MeV} / \mathrm{c}^{2}$. No statistical or systematic errors are quoted.

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Summary

- More statistics $\checkmark$, full statistics $\boldsymbol{X}$
- MC generation of $\phi \rightarrow \omega \gamma, \pi^{+} \pi^{-} \gamma$ and $\mu^{+} \mu^{-} \gamma . \chi$
- Calculate differential and total cross section $\checkmark$, correct physics $X$.
- Efficiency. $\boldsymbol{X}$, errors $\boldsymbol{X}$.
- Systematics. $X$

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Resolutions

$\mathrm{M}_{\gamma \gamma}$ plot from $\pi^{+} \pi^{-} \pi^{0} \gamma$ (left), a double guassian fit in mass range [80, 180] $\mathrm{MeV} / \mathrm{c}^{2}$. $\sigma_{\gamma \gamma} \sim 2.75 \mathrm{MeV} / \mathrm{c}^{2} . \pi^{+} \pi^{-} \pi^{0}$ invariant mass difference $\mathrm{M}_{3 \pi, \text { rec }}-\mathrm{M}_{3 \pi, \text { true }}$ from $\pi^{+} \pi^{-} \pi^{0} \gamma$ (right), a double guassian fit in range [-100, 100] $\mathrm{MeV} / \mathrm{c}^{2}, \sigma_{3 \pi} \sim 2.42 \mathrm{MeV} / \mathrm{c}^{2}$. Arrows indicate $3-\sigma$ region.

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Chi-square Fitting

At the $i^{\text {th }}$ bin, given selected data events $N_{d_{i}}$, MC channels of "signal" $N_{s_{i}}$ and set of background $N_{b_{j, i}}$ with indices $s_{i}$ and $b_{j, i}$ respectively, $j=1,2,3,4$ gives number of MC channels. The prediction of number of data $N_{p_{i}}$ is given by a superposition of MC events

$$
\begin{equation*}
N_{p_{i}}=N_{D}\left(f_{s} \frac{N_{s_{i}}}{N_{S}}+\sum_{j=1}^{4} f_{b_{j}} \frac{N_{b_{j, i}}}{N_{B_{j}}}\right) \equiv \omega_{s} N_{s_{i}}+\sum_{j=1}^{4} \omega_{b_{j}} N_{b_{j, i}} \tag{8}
\end{equation*}
$$

where $N_{D}=\sum_{i=1} N_{d_{i}}$ is total number of selected data events $N_{S}$ and $N_{B_{j}}$ are total number of MC signal and MC background, $w_{s}$ and $w_{b_{j}}$ are the normalized weights for signal and background known as Scaling Factor (SF). $f_{s}$ and $f_{b_{j}}$ are fraction of MC signal and MC background events satisfy constraint

$$
\begin{equation*}
f_{s}+\sum_{j=1}^{4} f_{b_{j}}=1 \tag{9}
\end{equation*}
$$

Fit $N_{p_{i}}$ to the observation $N_{d_{i}}$ with error $\sigma_{i}=\sqrt{N_{d_{i}}}$ by minimizing the chi-square

$$
\begin{equation*}
\chi^{2}=\sum_{i=1}\left(\frac{N_{i}-N_{p_{i}}}{\sigma_{i}}\right)^{2} \tag{10}
\end{equation*}
$$

to obtain fitted parameters $\hat{f}_{s}$ and $\hat{f}_{b_{j}}$ and calculate corresponding scaling factor $\hat{w}_{s}$ and $\hat{w}_{b_{j}}$ according Eq.8.

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$

## Error Propagation

Recall predicted number of events at $i^{\text {th }}$ bin $N_{p_{i}}$ from Eq. $8 N_{p_{i}}=\omega_{s} N_{s_{i}}+\sum_{j=1}^{4} \omega_{b} N_{b j, i}$. It is straight forward to write down error propagation formula

$$
\begin{equation*}
\sigma_{N_{p_{i}}}=\sqrt{N_{s_{i}}^{2} \sigma_{w_{s}}^{2}+w_{s}^{2} N_{s_{i}}+\sum_{j=1}^{4} N_{b_{i}}^{2} \sigma_{w_{b_{j, i}}^{2}}+w_{b_{j}}^{2} N_{b_{j, i}}} \tag{11}
\end{equation*}
$$

Here we have used possion distribution assumption that $\sigma_{s_{i}}^{2}$ or $\sigma_{b, 1}^{2}$ equal the event number $N_{s_{i}}$ or $N_{b_{j, i}}$. It is sufficient to derive uncertainty formula for "signal" channel $\sigma_{w_{s}}$. From definition $w_{s}=\frac{N_{D} f_{S}}{N_{S}}$, one could write down

$$
\begin{align*}
\sigma_{w_{s}} & =\sqrt{\left|\frac{\partial w_{s}}{\partial N_{D}}\right|^{2} \sigma_{N_{D}}^{2}+\left|\frac{\partial w_{s}}{\partial N_{S}}\right|^{2} \sigma_{N_{S}}^{2}+\left|\frac{\partial w_{s}}{\partial f_{s}}\right|^{2} \sigma_{f_{s}}^{2}} \\
& =w_{s} \sqrt{\frac{1}{N_{D}}+\frac{1}{N_{S}}+\frac{1}{f_{s}}} \tag{12}
\end{align*}
$$

similarly, for background channels

$$
\begin{equation*}
\sigma_{b_{j}}=w_{b_{j}} \sqrt{\frac{1}{N_{D}}+\frac{1}{N_{B_{j}}}+\frac{1}{f_{b_{j}}}} \tag{13}
\end{equation*}
$$

$$
e^{+} e^{-} \rightarrow \pi^{+} \pi^{-} \pi^{0} \gamma
$$
