

Measuring the electron energy: a first study using GEANT4

Riccardo Nunzio Pilato

Apparatus setup

Single module:

50 modules
in total

CsI Calorimeter: 50 cm thickness $\sim 27X_0$

1 m x 1 m

Distance between last Si and CsI calorimeter: 1 m

Only the energy deposit of the e^- in the calorimeter is plotted (the muon is removed)

STEP 1: $\theta_e = 0$ $\varphi_e = 0$, $E_e = 1, 2, 10$ GeV. e^- start at 1st module

1.a) $E_e = 1$ GeV

$N_e = 100k$

$N_e (E_{cal} > 0) = 98148$

- ~98% of electrons reach the calorimeter

Energia rilasciata nel calorimetro ($E_e = 1$ GeV, partenza: 50 modulo, $\theta_e = 0$)

Start at the center of Be:
Multiple Scattering

angular spread of ~2 mrad
on θ_e (at $E_e \sim 1$ GeV)

Punto di impatto nel calorimetro ($E_e = 1$ GeV, partenza: 50 modulo, $\theta_e = 0$)

1.b) $E_e = 2 \text{ GeV}$

$$N_e = 100k$$

$$N_e (E_{\text{cal}} > 0) = 99793$$

Energia rilasciata nel calorimetro ($E_e = 2 \text{ GeV}$, partenza: 50 modulo, $\theta_e = 0$)

Punto di impatto nel calorimetro ($E_e = 2 \text{ GeV}$, partenza: 50 modulo, $\theta_e = 0$)

- 99,7% of events reach the calorimeter
- 93,2% of events with $E_{\text{calo}} > 1 \text{ GeV}$

1.c) $E_e = 10 \text{ GeV}$

$$N_e = 20k$$

$$N_e (E_{\text{cal}} > 0) = 20k$$

- All the events reach the calorimeter

Energia rilasciata nel calorimetro ($E_e = 10 \text{ GeV}$, partenza: 50 modulo, $\theta_e = 0$)

Punto di impatto nel calorimetro ($E_e = 10 \text{ GeV}$, partenza: 50 modulo, $\theta_e = 0$)

STEP 2: $\theta_e = 0$ $\varphi_e = 0$, $E_e = 1, 2, 10$ GeV. e^- start at 25th module

2.a) $E_e = 1$ GeV

$N_e = 100k$

$N_e (E_{\text{cal}} > 0) = 99855$

- 99,8% of events reach the calorimeter

Larger angular acceptance

Punto di impatto nel calorimetro ($E_e = 1$ GeV, partenza: 25 modulo, $\theta_e = 0$)

histo2	
Entries	99855
Mean x	-0.01887
Mean y	-0.03468
Std Dev x	11.74
Std Dev y	11.81

Energia rilasciata nel calorimetro ($E_e = 1$ GeV, partenza: 25 modulo, $\theta_e = 0$)

2.b) $E_e = 2 \text{ GeV}$

$$N_e = 100k$$

$$N_e (E_{\text{cal}} > 0) = 99978$$

Energia rilasciata nel calorimetro ($E_e = 2 \text{ GeV}$, partenza: 25 modulo, $\theta_e = 0$)

Punto di impatto nel calorimetro ($E_e = 2 \text{ GeV}$, partenza: 25 modulo, $\theta_e = 0$)

- >99,9% of events reach the calorimeter
- 99,8% of events with $E_{\text{calo}} > 1 \text{ GeV}$

2.c) $E_e = 10 \text{ GeV}$

$$N_e = 20k$$

$$N_e (E_{\text{cal}} > 0) = 20k$$

Energia rilasciata nel calorimetro ($E_e = 10 \text{ GeV}$, partenza: 25 modulo, $\theta_e = 0 \text{ mrad}$)

Punto di impatto nel calorimetro ($E_e = 10 \text{ GeV}$, partenza: 25 modulo, $\theta_e = 0$)

STEP 3: $E_e = 1, 2, 10 \text{ GeV}$ $\theta_e = \theta_e(E_e)$. e^- start at 1st module

3.a) $E_e = 1 \text{ GeV}$, $\theta_e = 31,82 \text{ mrad}$, $\varphi_e = 0$ → After 26 m $x_c \approx 80 \text{ cm}$

$N_e = 100k$

$N_e (E_{\text{cal}} > 0) = 4872$

- 4,8% of events reach the calorimeter

Energia rilasciata nel calorimetro ($E_e = 1 \text{ GeV}$, partenza: 50 modulo, $\theta_e = 31.82 \text{ mrad}$)

Punto di impatto nel calorimetro ($E_e = 1 \text{ GeV}$, partenza: 50 modulo, $\theta_e = 31.82 \text{ mrad}$)

3.a.1) $E_e = 1$ GeV, $\theta_e = 31,82$ mrad
 $\varphi_e = 0$

With a 2 m x 2 m
calorimeter

Energia rilasciata nel calorimetro ($E_e = 1$ GeV, partenza: 50 modulo, $\theta_e = 31.82$ mrad)

$$N_e = 10k$$

$$N_e (E_{cal} > 0) = 9643$$

- 96,4% of events reach the calorimeter

3.b) $E_e = 2 \text{ GeV}$, $\theta_e = 22,44 \text{ mrad}$ $\varphi_e = 0$

$$N_e = 100k$$

$$N_e (E_{\text{cal}} > 0) = 26422$$

- 26,4% of events reach the calorimeter
- 13,6% of events with $E_{\text{calo}} > 1 \text{ GeV}$

→ After 26 m $x_c \approx 58 \text{ cm}$

Out of calorimeter

Punto di impatto nel calorimetro ($E_e = 2 \text{ GeV}$, partenza: 50 modulo, $\theta_e = 22.44 \text{ mrad}$)

3.b.1) $E_e = 2$ GeV, $\theta_e = 22,44$ mrad
 $\varphi_e = 0$

With a 2 m x 2 m
calorimeter

Energia rilasciata nel calorimetro ($E_e = 2$ GeV, partenza: 50 modulo, $\theta_e = 22.44$ mrad)

$$N_e = 10k$$

$$N_e (E_{cal} > 0) = 10k$$

3.c) $E_e = 10 \text{ GeV}$, $\theta_e = 9,74 \text{ mrad}$ $\varphi_e = 0$

$$N_e = 20k$$

$$N_e (E_{\text{cal}} > 0) = 20k$$

→ After 26 m $x_c \approx 25 \text{ cm}$

Hits the calorimeter

Energia rilasciata nel calorimetro ($E_e = 10 \text{ GeV}$, partenza: 50 modulo, $\theta_e = 9.74 \text{ mrad}$)

Punto di impatto nel calorimetro ($E_e = 10 \text{ GeV}$, partenza: 50 modulo, $\theta_e = 9.74 \text{ mrad}$)

STEP 4: $E_e = 1, 2, 10 \text{ GeV}$ $\theta_e = \theta_e(E_e)$. e^- start at 25st module

4.a) $E_e = 1 \text{ GeV}$, $\theta_e = 31,82 \text{ mrad}$, $\varphi_e = 0$ → After 13,5 m $x_c \approx 43 \text{ cm}$

$N_e = 100\text{k}$

$N_e (E_{\text{cal}} > 0) = 94211$

- 94,2% of events reach the calorimeter

Energia rilasciata nel calorimetro ($E_e = 1 \text{ GeV}$, partenza: 25 modulo, $\theta_e = 31.82 \text{ mrad}$)

Hits the calorimeter

Punto di impatto nel calorimetro ($E_e = 1 \text{ GeV}$, partenza: 25 modulo, $\theta_e = 31.82 \text{ mrad}$)

4.b) $E_e = 2 \text{ GeV}$, $\theta_e = 22,44 \text{ mrad}$, $\varphi_e = 0$

$N_e = 100\text{k}$

$N_e (E_{\text{cal}} > 0) = 99952$

- >99,9% of events reach the calorimeter
- 99,8% of events with $E_{\text{calo}} > 1 \text{ GeV}$

→ After $13,5 \text{ m}$ $x_c \approx 30 \text{ cm}$

Hits the calorimeter

Energia rilasciata nel calorimetro ($E_e = 2 \text{ GeV}$, partenza: 25 modulo, $\theta_e = 22.44 \text{ mrad}$)

Punto di impatto nel calorimetro ($E_e = 2 \text{ GeV}$, partenza: 25 modulo, $\theta_e = 22.44 \text{ mrad}$)

4.c) $E_e = 10 \text{ GeV}$, $\theta_e = 9,74 \text{ mrad}$, $\varphi_e = 0$

$$N_e = 20k$$

$$N_e (E_{\text{cal}} > 0) = 20k$$

→ After 13,5 m $x_c \approx 13 \text{ cm}$

Hits the calorimeter

Energia rilasciata nel calorimetro ($E_e = 10 \text{ GeV}$, partenza: 25 modulo, $\theta_e = 9.74 \text{ mrad}$)

Punto di impatto nel calorimetro ($E_e = 10 \text{ GeV}$, partenza: 25 modulo, $\theta_e = 9.74 \text{ mrad}$)

STEP 5: θ_e [0, 35 mrad] generated according to LO distribution.
 φ_e generated uniformly between $[0, 2\pi]$, $E_e = E_e(\theta_e)$
 e^- start at 25th module

θ_μ ricostruito vs θ_e ricostruito

θ_e^{ric} obtained applying
a gaussian smearing
to θ_e ,
with σ = MS effect in a
single module

$$R = \frac{N_e(E_{cal} > 1\text{GeV})}{N_e}$$

$R < 99,9\%$ if $\theta_e > 22\text{mrad}$

$R < 99,9\%$ when $E_e < 2,2$ GeV

Conclusions

- A 2 m x 2 m calorimeter (like Na48 one) is necessary in order to reconstruct the electron energy in range of 1 - 2 GeV when this electrons start from the first module.
- A 1 m x 1 m calorimeter allows a reconstruction of >95% of low energy electrons (1 - 2 GeV) starting from the 25th module.
- Applying an energy cut of $E_{\text{cal}} > 1$ GeV allows to use the calorimetric measure of the electron energy for 99,9% (or higher) of the events with $E_e > 2,2$ GeV ($\theta_e < 22\text{mrad}$).
- Simulation is very simple: there is no tracking reconstruction (to be implemented), no material outside the detector and we took out the energy deposit of the muon.
- We didn't include correlation between energy deposit with other variables (like position of the cluster, angle of emitted electron, hit multiplicity in the Si planes, etc...)
- An inefficiency above 10^{-5} on the normalisation is important? (can be eliminated as overall normalization by a fit to the constraint at $q^2 \sim 0$?)

Please consider this results as preliminary

I would like to thank Prof. Stefano Di Falco for his precious help with this simulation and for making me understand how to work with Geant4.
