- TOMMASO DIOTALEVI Ph.D. Student in Physics XXXIV Cycle (Academic Year 2018/19)

CNAF Technological Summer School 2018

ELK stack & log parsing

INFN-Bologna and University of Bologna

Goals

- Collection of logs (StoRM and Gridftp) coming from different machines @CNAF Tier-1.
- Data wrangling the information coming from such logs, using the ELK Stack suite.
- Create new visualisations and dashboards.

CNAF Technological Summer School 2018

This will lay the groundwork for the application of *Machine Learning* algorithms, to make predictions of possible malfunctions and critical failures, improving the overall system maintenance.

CNAF Technological Summer School 2018

Parse logs using Logstash FILTERS INPUTS \rightarrow Logstash Pipeline **Data Source** Elasticsearch

Inside the local cluster, Logstash creates a well defined pipeline.

- defined structure.

CNAF Technological Summer School 2018

TOMMASO DIOTALEVI

Input configuration that collects data from Filebeats in a continuous live-feed streaming. Filter configuration required for parsing each event, identify named fields to build a user

Output configuration to route parsed data in a search analytics engine (Elasticsearch).

The different choice of filters for a correct parsing of log data was the biggest part of this project.

A large amount of them was parsed using the **grok** filter.

CNAF Technological Summer School 2018

Logstash Pipeline

Data Source

Elasticsearch

The different choice of filters for a correct parsing of log data was the biggest part of this project.

A large amount of them was parsed using the **grok** filter.

A grok filter, based on Regular Expressions, is adopted to match specific portions of log entries by creating a series of pattern defined as follows:

%{SYNTAX:SEMANTIC}

where SYNTAX is the name of the pattern that will match the text, while the SEMANTIC is the identifier of the piece of text being matched.

match =>

CNAF Technological Summer School 2018

{ "message" => "%{IP_EMB:clientIP}"}

The different choice of filters for a correct parsing of log data was the biggest part of this project.

A large amount of them was parsed using the **grok** filter.

A grok filter, based on Regular Expressions, is adopted to match specific portions of log entries by creating a series of pattern defined as follows:

where SYNTAX is the name of the pattern that will match the text, while the SEMANTIC is the identifier of the piece of text being matched.

Several patterns are predefined e.g. IP, DATE, TIME. However, *custom patterns* are required in order to match every possible scenario. (Such patterns are stored in a specific file).

 $IP_EMB :: (ffff(:0{1,4}){0,1}:){0,1}((25[0-5]|(2[0-4]|1{0,1}[0-9]){0,1}[0-9]){.)}{3,3}(25[0-5]|(2[0-4]|1{0,1}[0-9]){0,1}[0-9])|%{IP}{.}$

Installation and setup of the ELK suite in the local Openstack VM.

Read the documentation on the ELK stack, to understand the basic principles.

Implement log filters, using Logstash. Extract only the most valuable information.

CNAF Technological Summer School 2018

Troubleshooting

Multiline Parsing

An error occurred during the parsing of multiline log messages, such as Java Stack traces. In an atypical day of logs, several multiline entires were produced as the result of a debug operation. These messages, were not parsed correctly into Logstash since it was initially configured to consider a single log but rather a line ending with a break-line.

Multiline Parsing

An error occurred during the parsing of multiline log messages, such as Java Stack traces. In an atypical day of logs, several multiline entires were produced as the result of a debug operation. These messages, were not parsed correctly into Logstash since it was initially configured to consider a single log but rather a line ending with a break-line.

Truncated Logs

An issue concerning StoRM logs, is the unexpected truncation of certain logs, in order to preserve disk space. Since this problem is not solvable at parse level, the solution adopted was the removal of incomplete information and leave out all the rest.

Troubleshooting

Multiline Parsing

An error occurred during the parsing of multiline log messages, such as Java Stack traces. In an atypical day of logs, several multiline entires were produced as the result of a debug operation. These messages, were not parsed correctly into Logstash since it was initially configured to consider a single log but rather a line ending with a break-line.

Truncated Logs

An issue concerning StoRM logs, is the unexpected truncation of certain logs, in order to preserve disk space. Since this problem is not solvable at parse level, the solution adopted was the removal of incomplete information and leave out all the rest.

Log sharing

The production of CSV files with information coming live from the machines was important also for others in the work group. In fact, using such flat files, it is possible to load them into high-level classification libraries and start to think at possible learning models. Solved using an external tool specific for such conversion, called *es2csv*.

Installation and setup of the ELK suite in the local Openstack VM.

Read the documentation on the ELK stack, to understand the basic principles.

Implement log filters, using Logstash. Extract only the most valuable information.

CNAF Technological Summer School 2018

Timeline

Visualize data

Using Kibana User Interface, it is possible to create new visualisations and collect them to form new dashboards. **Example:** 1 day of logs (25th of November 2018 - local time).

Count of INFO, ERROR and WARN logs from the StoRM Back-End machine.

```
CNAF Technological Summer School 2018
```

TOMMASO DIOTALEVI

Visualize data

Count of different requests for the StoRM Front-End. (the Back-End similar plot is not shown.)

CNAF Technological Summer School 2018

last_ptg_duration last_ptp_duration

Duration (in milliseconds) of the last Prepare_to_Get and Prepare_to_Put in the *heartbeat* log.

CNAF Technological Summer School 2018

Difference between the total last ptp (ptg) and the one which were successful, in the *heartbeat* log. (A value different than zero implies some failed request).

CNAF Technological Summer School 2018

Iast_ptg_duration last_ptp_duration

Duration (in milliseconds) of the last Prepare_to_Get and Prepare_to_Put in the *heartbeat* log.

 \bigcirc Max difference_ptg

Synchronous and asynchronous counts in the StoRM *monitoring* log, divided into two separate columns.

TOMMASO DIOTALEVI

CNAF Technological Summer School 2018

too late to intervene.

CNAF Technological Summer School 2018

Next Steps

- > Parse the remaining logs and verify that the de-structuralized information matches the
- > Improve the dashboard, showing useful information regarding the status and possible

 \succ Creation of a Machine Learning model that will use such information coming from the ELK Stack, classifying possible critical errors from logs and proactively act before it is

Conclusions

It was a great experience here at CNAF!

Assessing the most efforts and pain:

Log parsing is quite hard and really time consuming. I hope this work contributed to allow future students not to start again from the beginning.

Currently, I am a **Ph.D. student in Physics** and I will be moving to something else as major topic soon (probably in the fields of DL and FPGA).

I am potentially interested in the pursuance of the collaboration with CNAF: discussions as of how to set up a *constant interaction* with CNAF developers and operators for a better log understanding and to improve log quality may be a good starting point.

CNAF Technological Summer School 2018

Thanks
