

# Preliminary analysis of the acquired data at GSI (April 2019)

roberto spighi, 5/6/2019

## Performed Analysis:

- Single detectors
  - SC, BM, VTX, SCN
- Correlation between sub-detectors:
  - BM-VTX
  - BM-SCN (for NO Target Runs)
  - VTX-SCN

## Acquired data

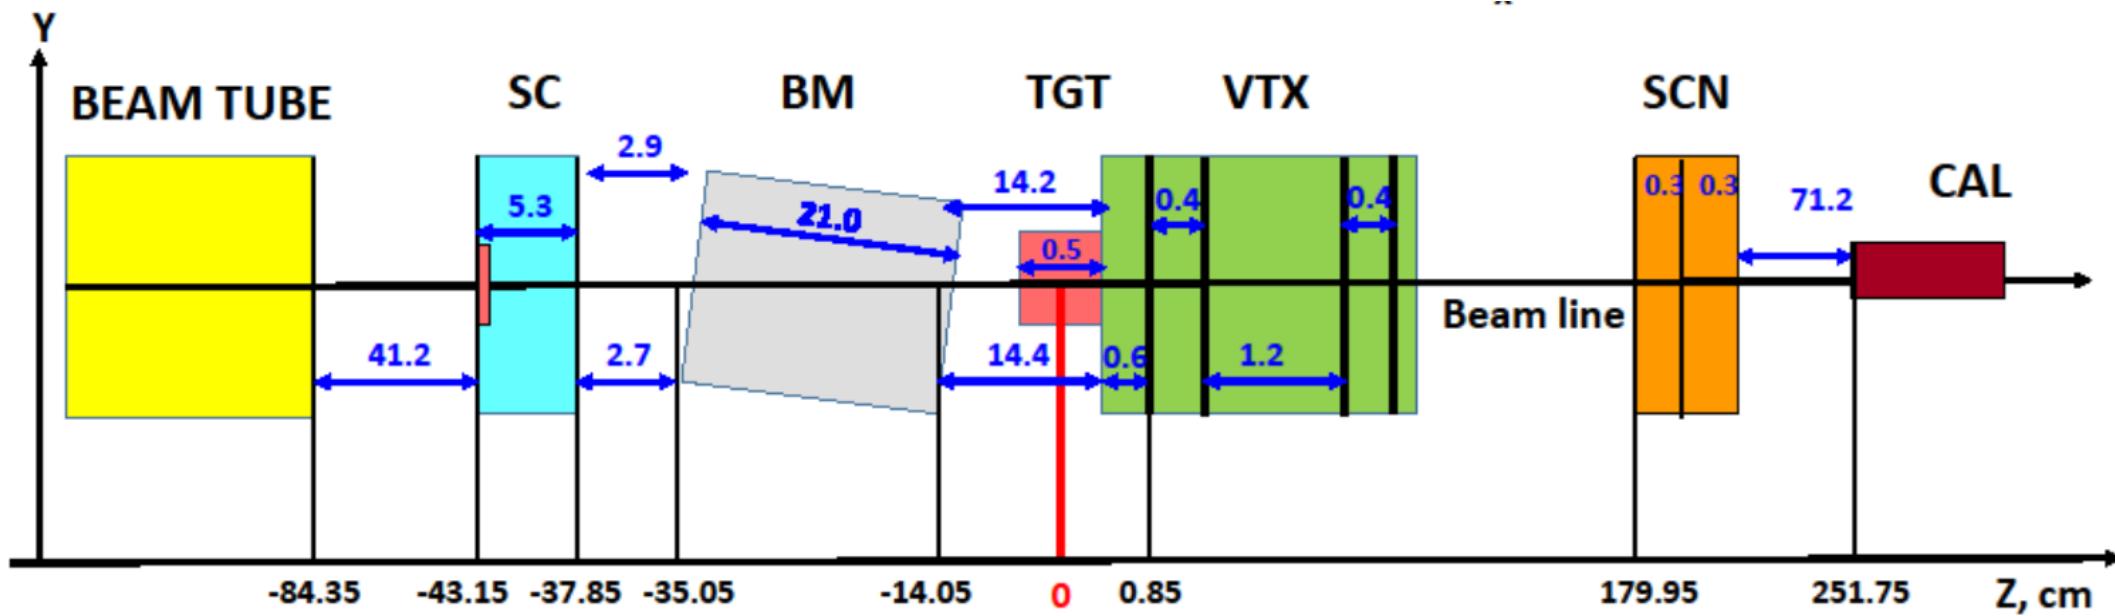

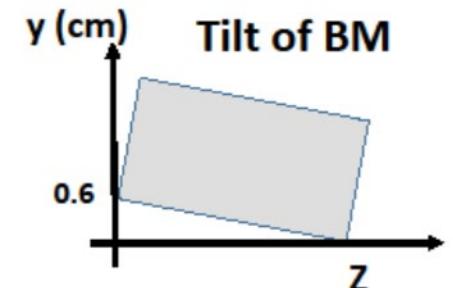

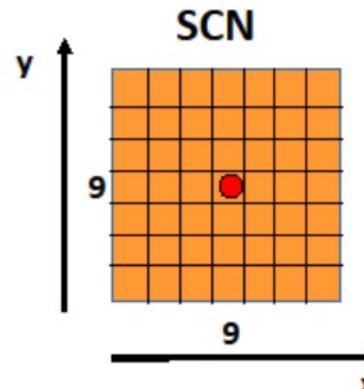

Without Target

With Target

Run	Statistics	Target	Characteristic	date	Duration (s)
2210	20463	NO	DAQ Test	7/4, 18h,41'	126
2211	62782	NO	" "	7/4, 18h,44'	350
2212	116349	NO	" "	7/4, 18h,51'	626
2239	20821	YES	BM HV=1800 V	8/4, 19h,16'	161
2240	20004	YES	BM HV=1850 V	8/4, 19h,20'	157
2241	20041	YES	BM HV=1900 V	8/4, 19h,23'	153
2242	202729	NO	SCN Calibration	8/4, 19h,37'	1425
2251	6863	YES	Physics	9/4, 08h,33'	74

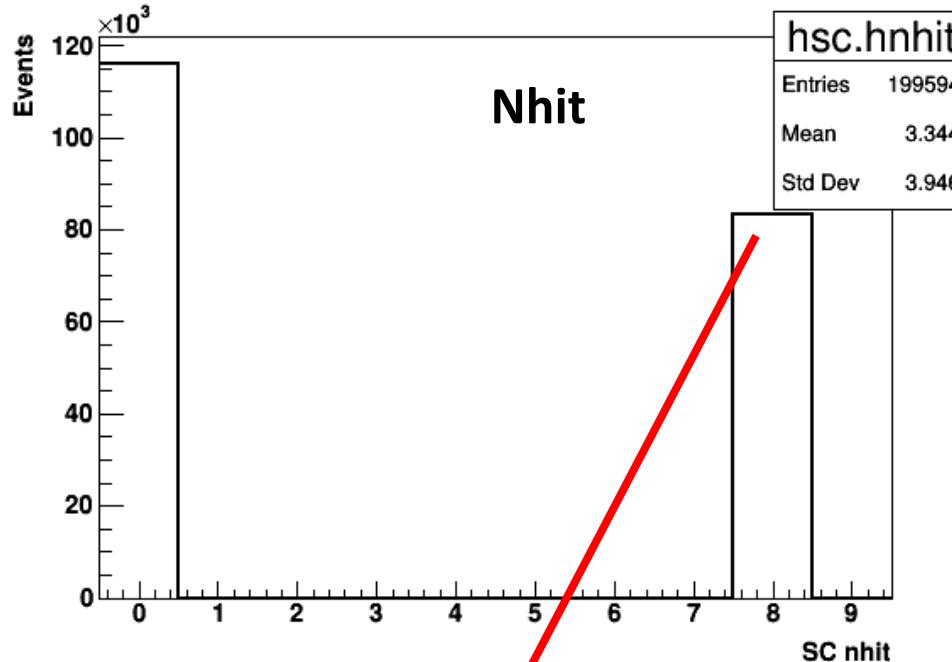

## Detectors geometry

- SC: scintillator of 250  $\mu\text{m}$
- BM: tilted after the first day of data taking
- TGT: 5 mm depth, C material ( $=\rho 1.83\text{g/cm}^3$ )
- VTX: 4 Si layers of 50  $\mu\text{m}$  depth
- SCN: 2 layers of 3 mm each (length 44 cm, active 40 cm)

## Start Counter, SC (Run 2210-11-12)

How to define SC efficiency?

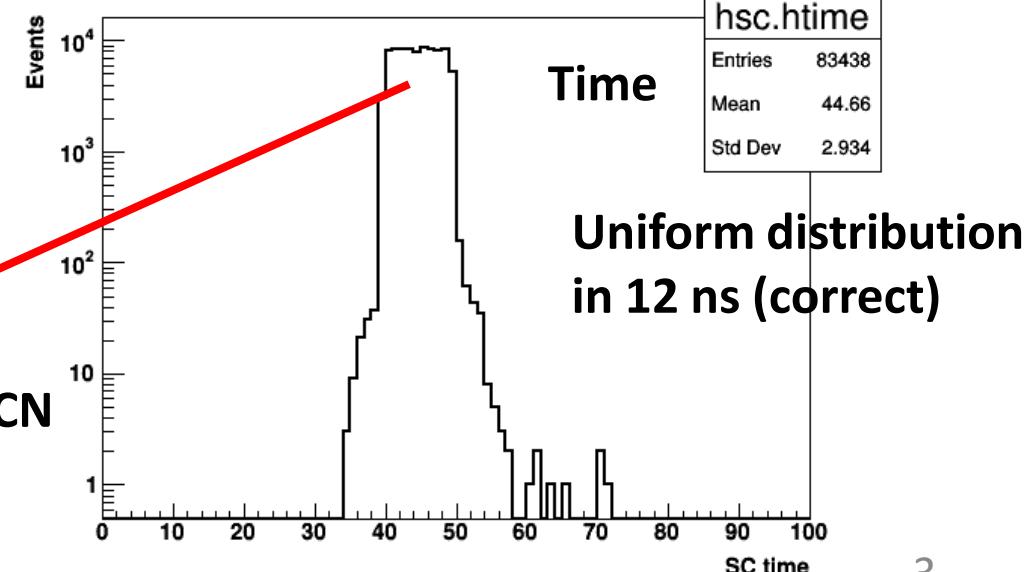

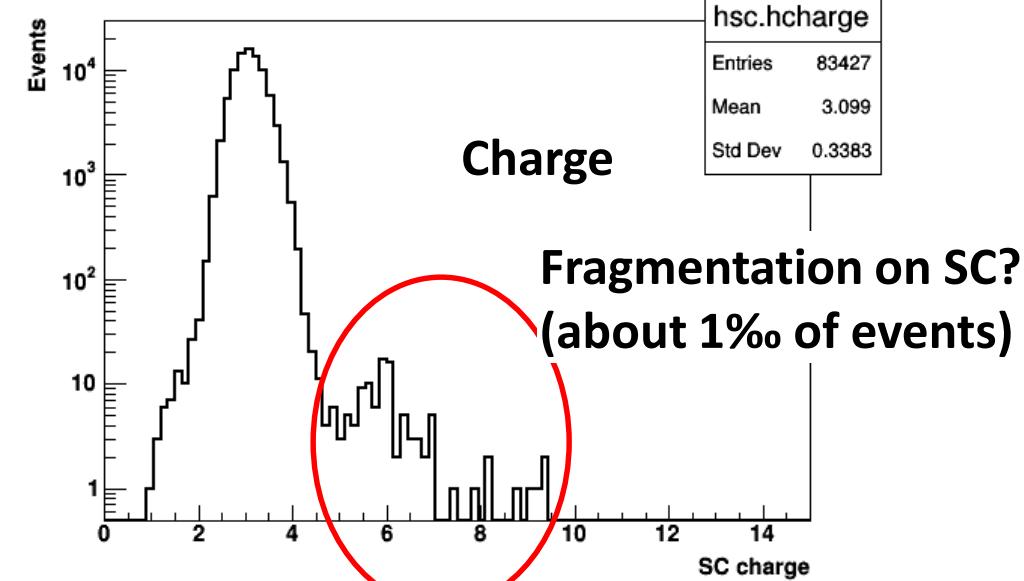

Efficiency = 40% (?)

Run 2239-51 Eff = 80%

" 2242 Eff = 100%

Probably different trigger definition

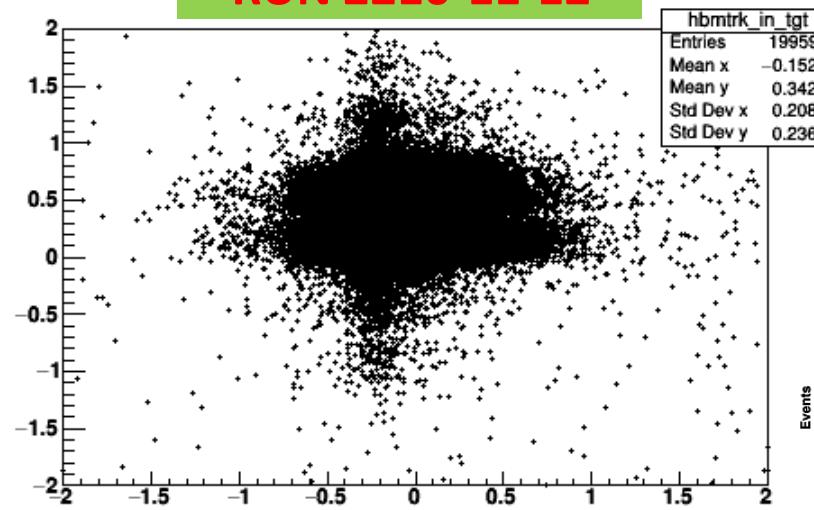

same distribution as SCN

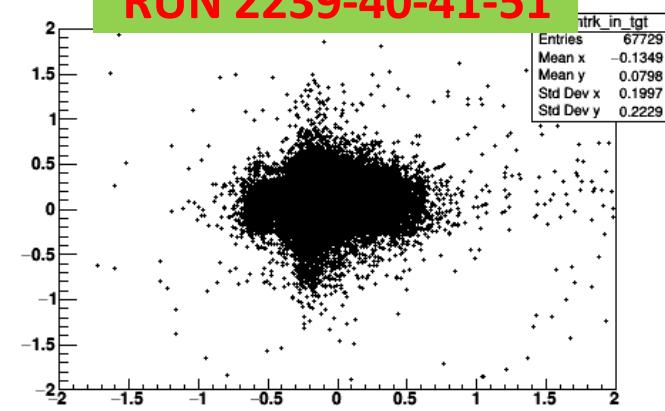

# Beam Monitor, BM

0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

**8-vertical and 4-horizontal  
do not give signal**

TW Front layer (layer 1 in shoe)

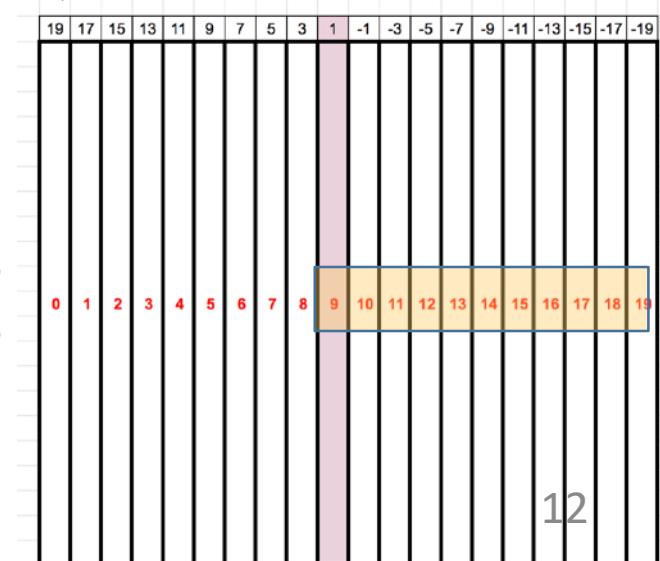

Bar id

TW Rear layer (layer 0 in shoe)

X axis (cm)

Bar id

## SCN charge definition

$$Q_{horiz} = \sqrt{Q_{Left} * Q_{Right}}$$

Charge product  
independent  
on hit position

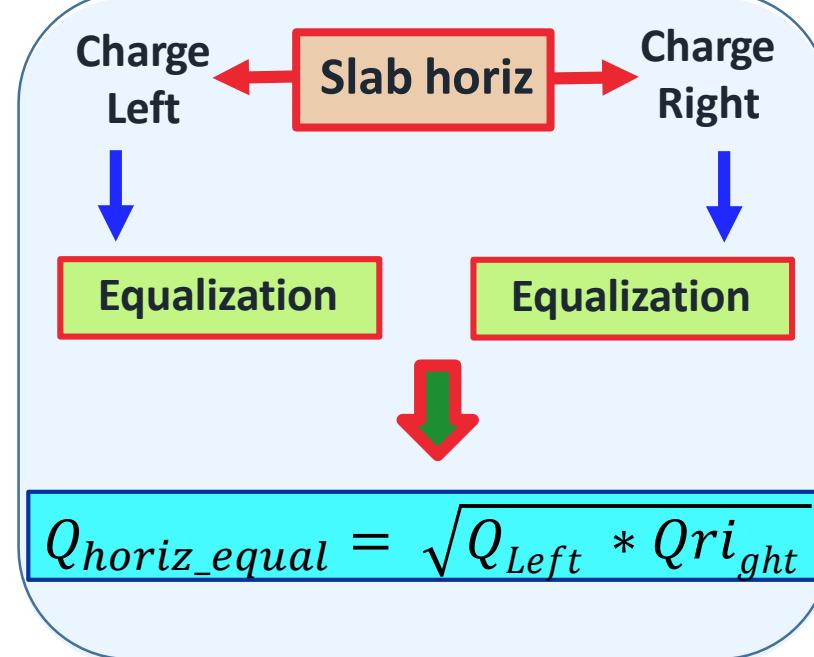

Equalization

$$Q_{horiz\_equal}$$

Same for  
Vertical Slab

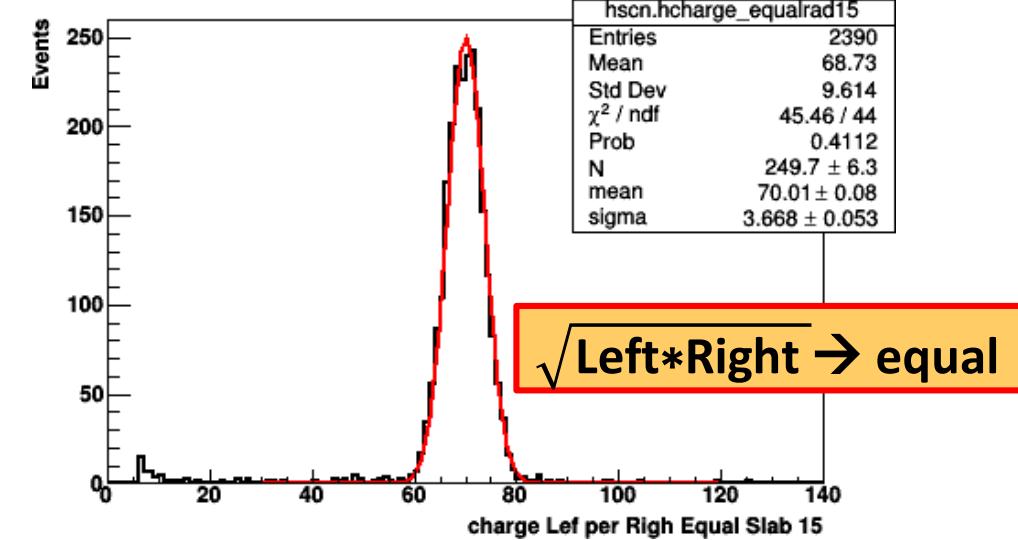

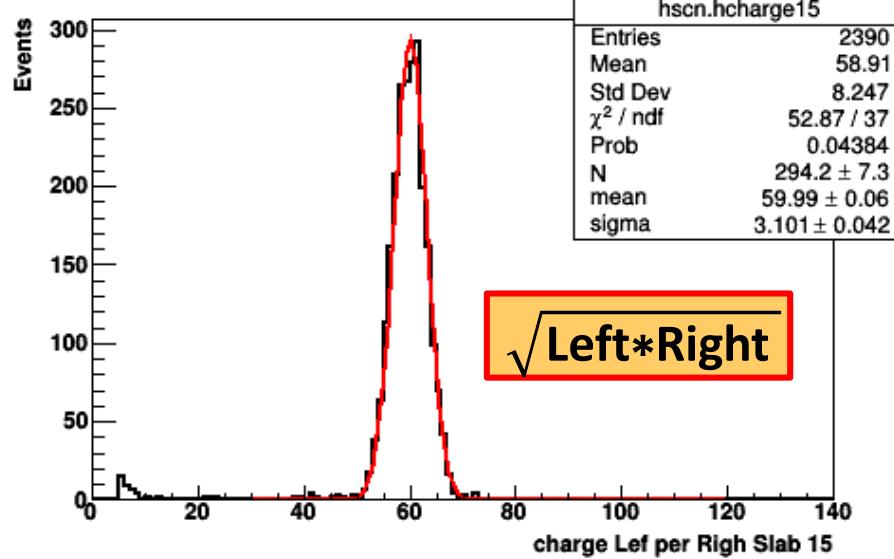

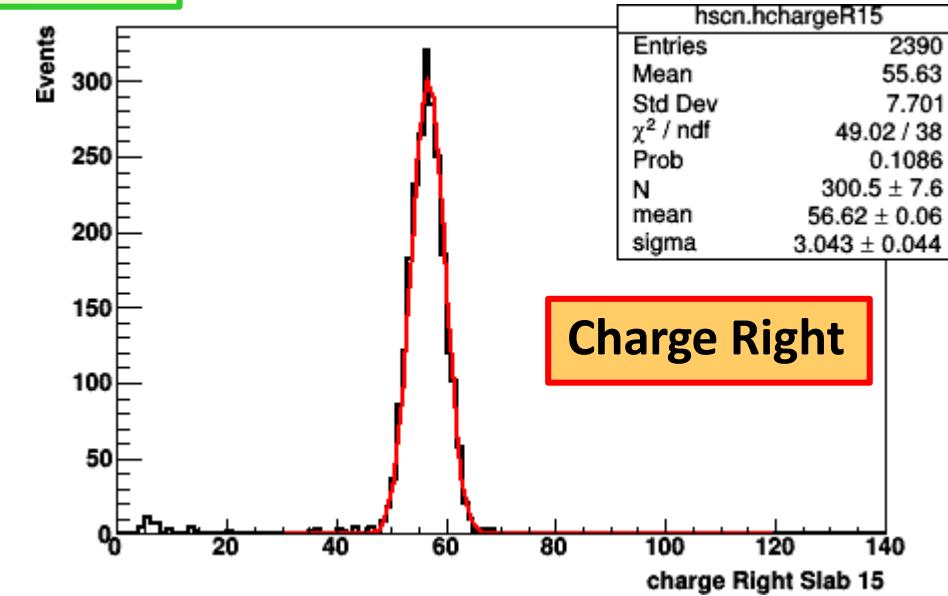

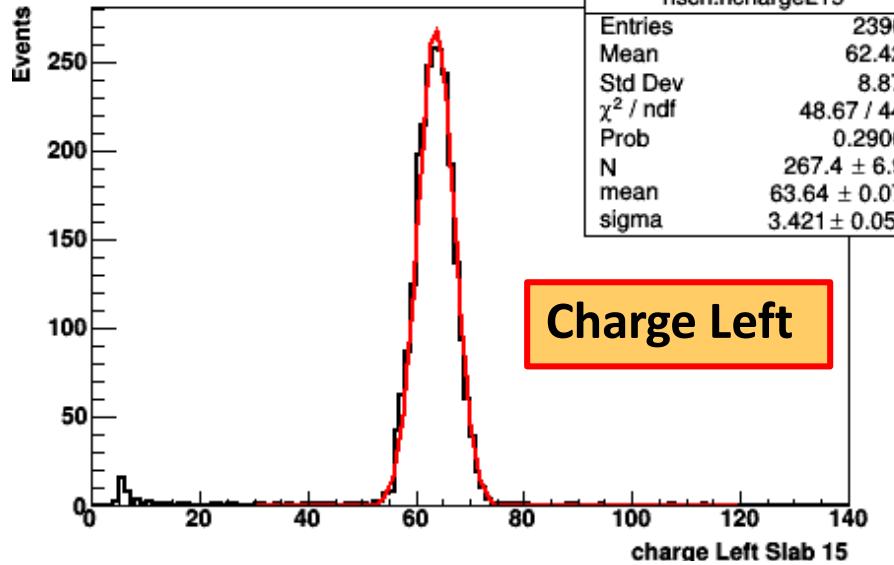

$$Q_{fragm} = Q_{horiz\_equal} + Q_{vert\_equal}$$

Tested also this possibility:  
SAME RESULTS

NO difference between the 2 methods

# Signal Equalization (Run 2242)

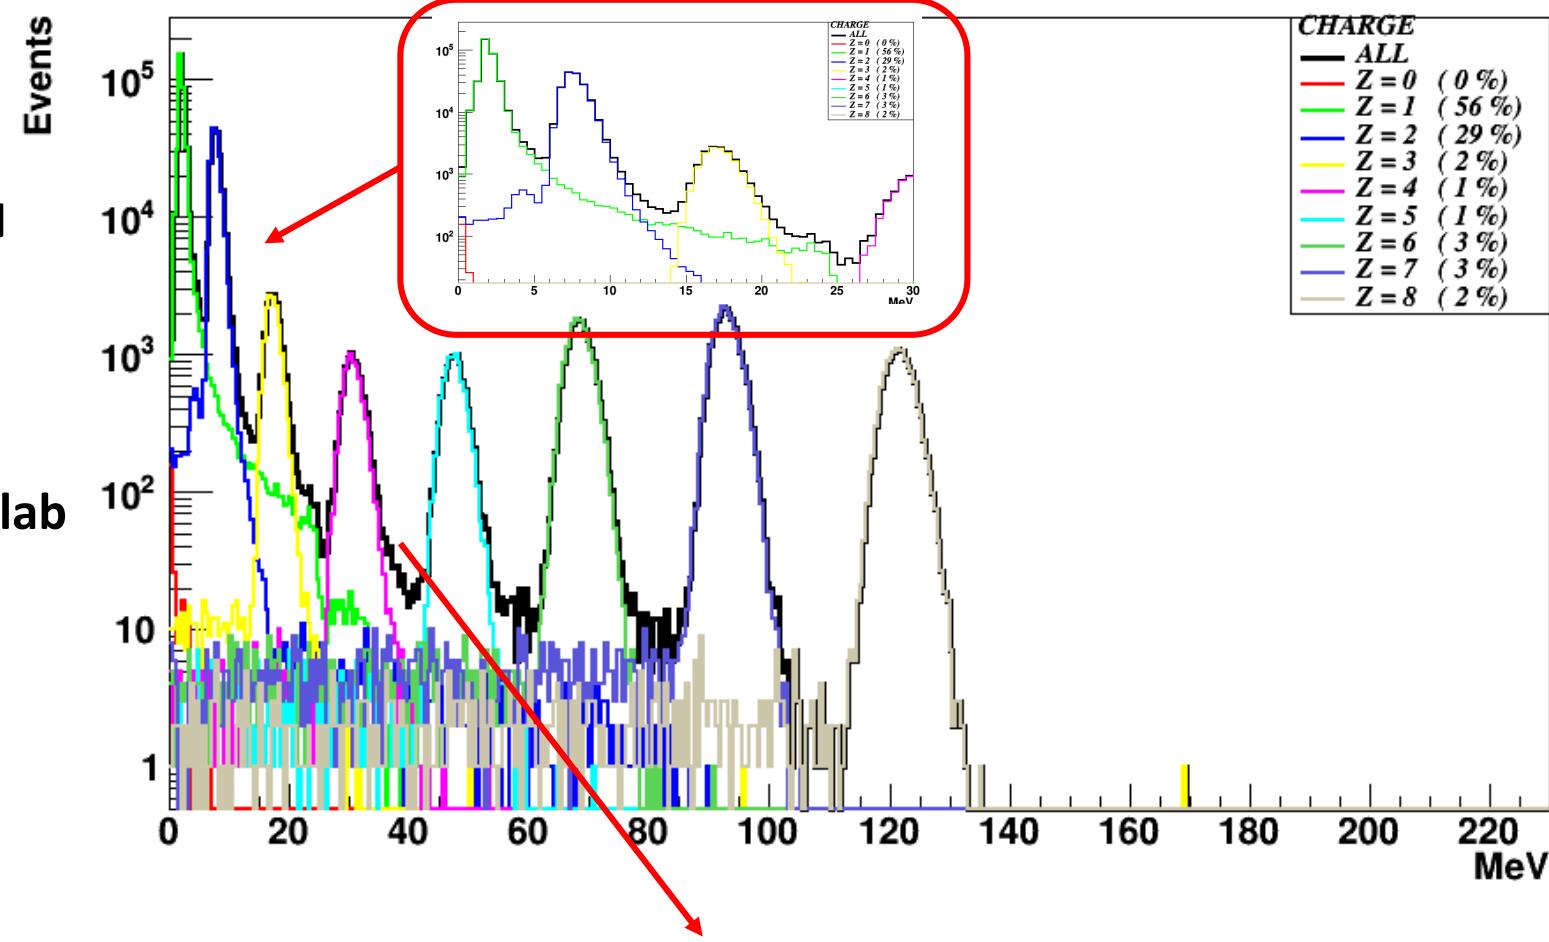

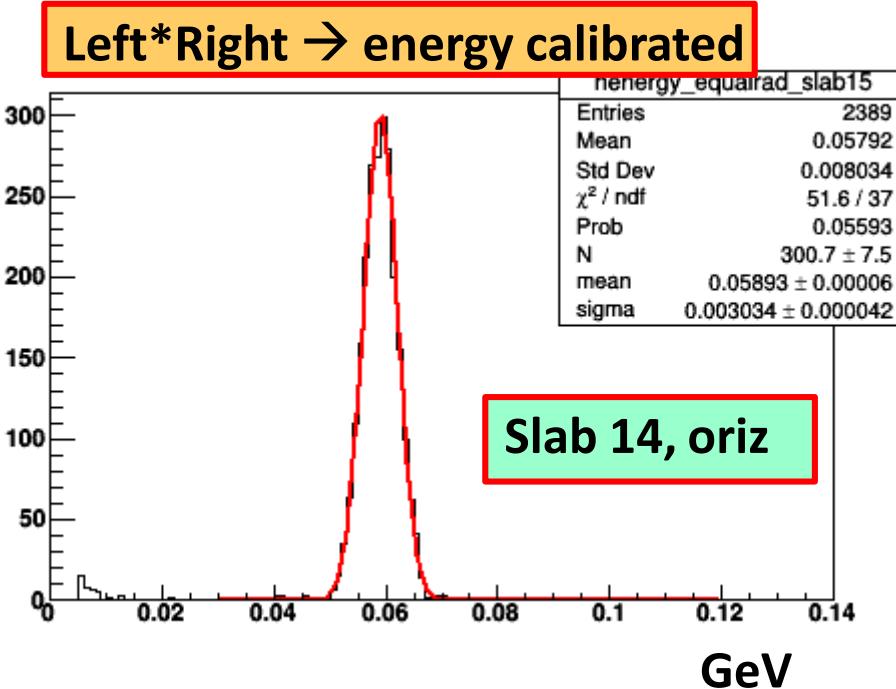

Each Signal of each slab positioned at 70 !! (arbitrary value)

## Signal "calibration" (Run 2242)

Simulation:  $^{16}\text{O}$  (400 Mev/u)  $\rightarrow$  dE/dx on SCN

Wide dynamic range: [2 – 120] MeV (H to O)

On average  $^{16}\text{O}$  (400 MeV/u)  $\rightarrow$  59 MeV per slab

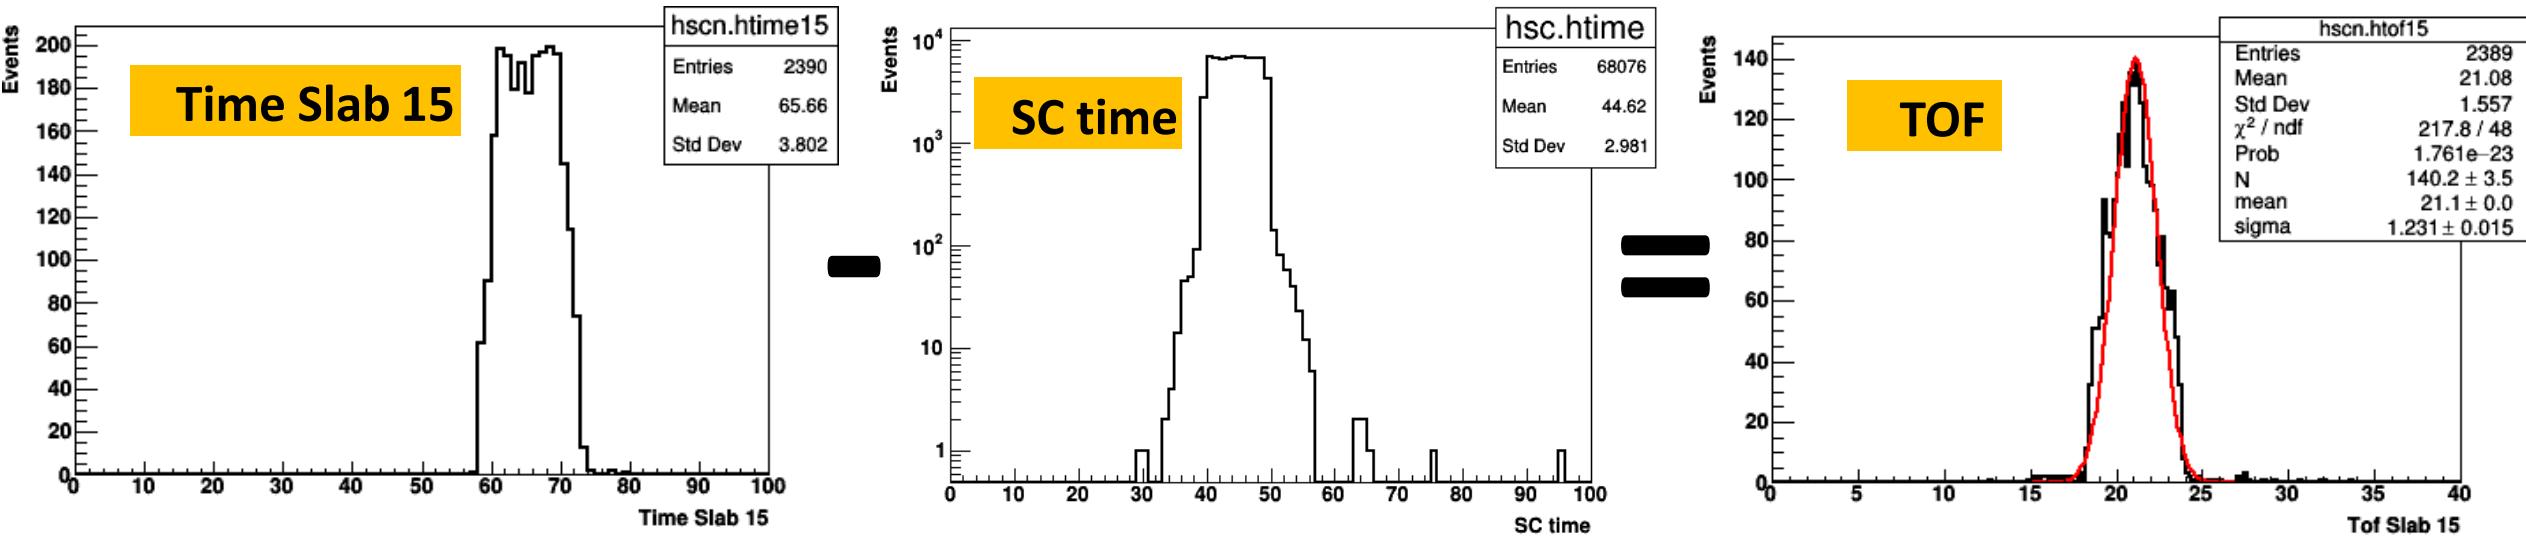

Obviously there is also the contribution from  $\beta$

To calibrate with only 1 energy is not a correct procedure

**Each Signal of each slab positioned at 0.059 GeV !!**

## TOF: example of slab 15: Run 2242

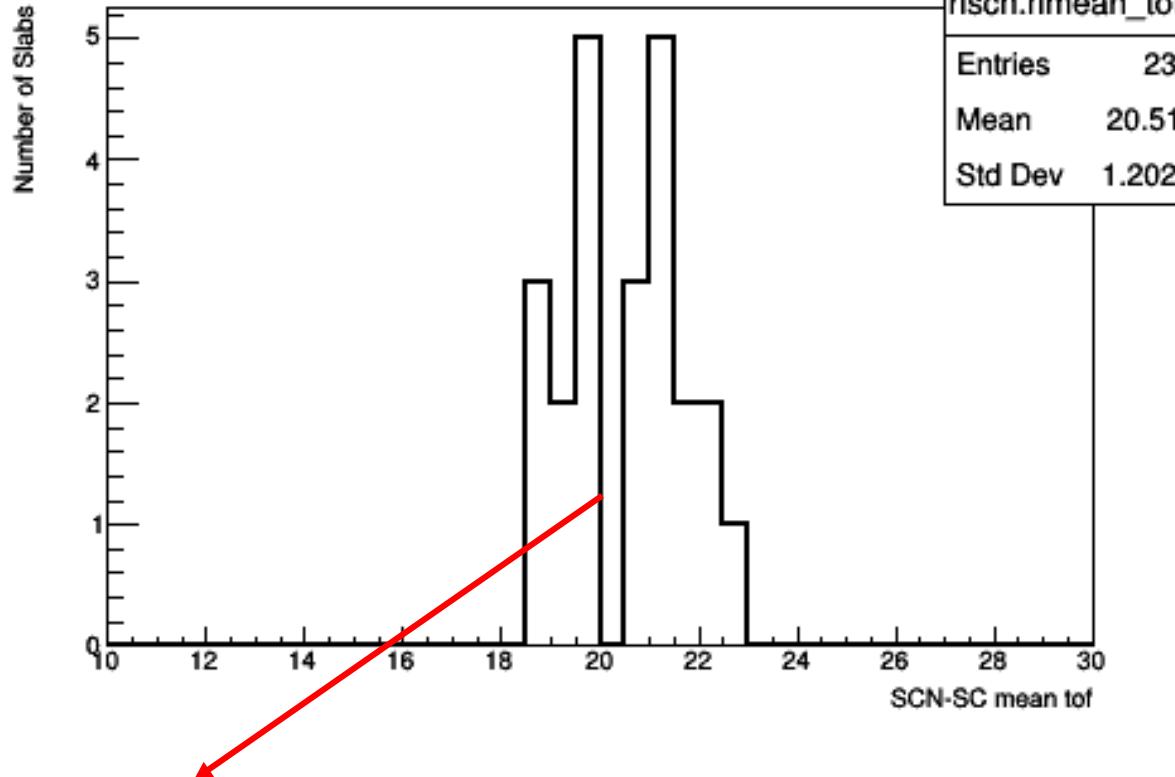

NO Target → Tof for  $^{16}\text{O}$  beam (400 MeV/u) = 10.5 ns → offset of ~10 ns

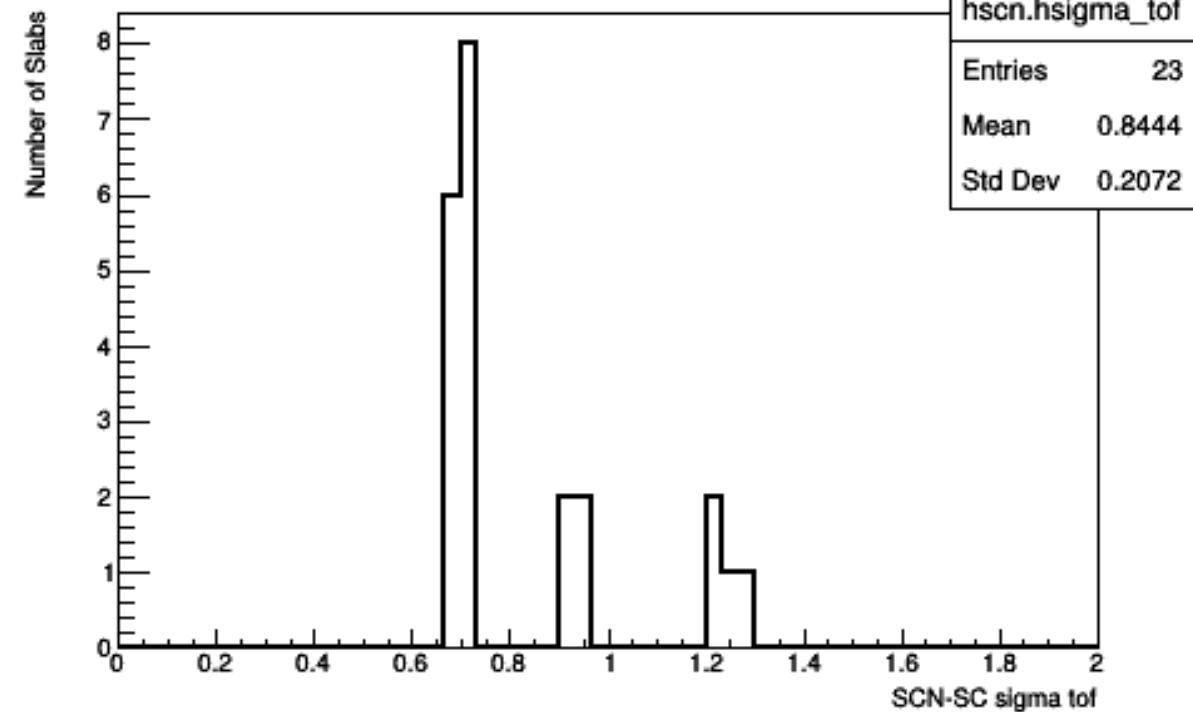

Evaluated the offset for each slab

Fitting the Tof of each slab with a Gaussian (only equalized slabs)

Determine the offset for each slab

Till now the Tof precision is low: [0.7 – 1.2] ns

Need more precise fit implementation

At the moment considered only the charge  
and not the E and  $\beta$  information

## *SCN: Signal combination*

**EQUALIZATION:**

ALL slab equalized to a arbitrary value

**MAKE ALL COMBINATIONS:** ALL horizontal slab combined with ALL vertical slab

**HYPOTHESIS:**

{

fragment deposit is similar in horizontal and vertical slab

Tof is similar in horizontal and vertical slab

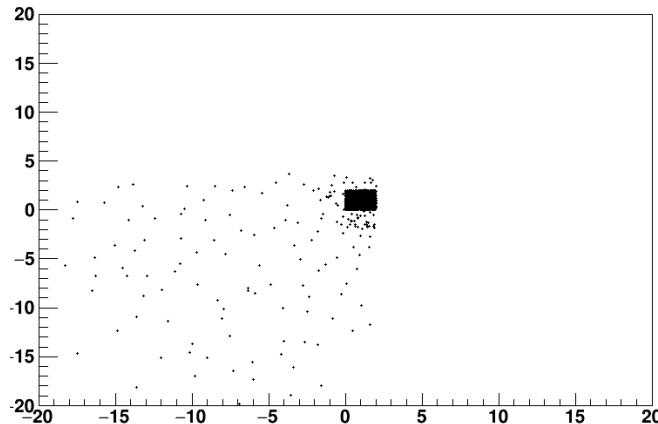

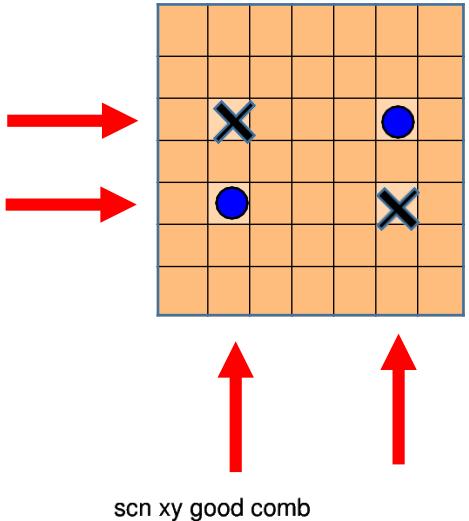

**GOOD COMBINATION:**

if horizontal and vertical hit:

**Diff Charge < 0.1 \* Average Charge**

**Diff Tof < 0.2 \* Average Tof**

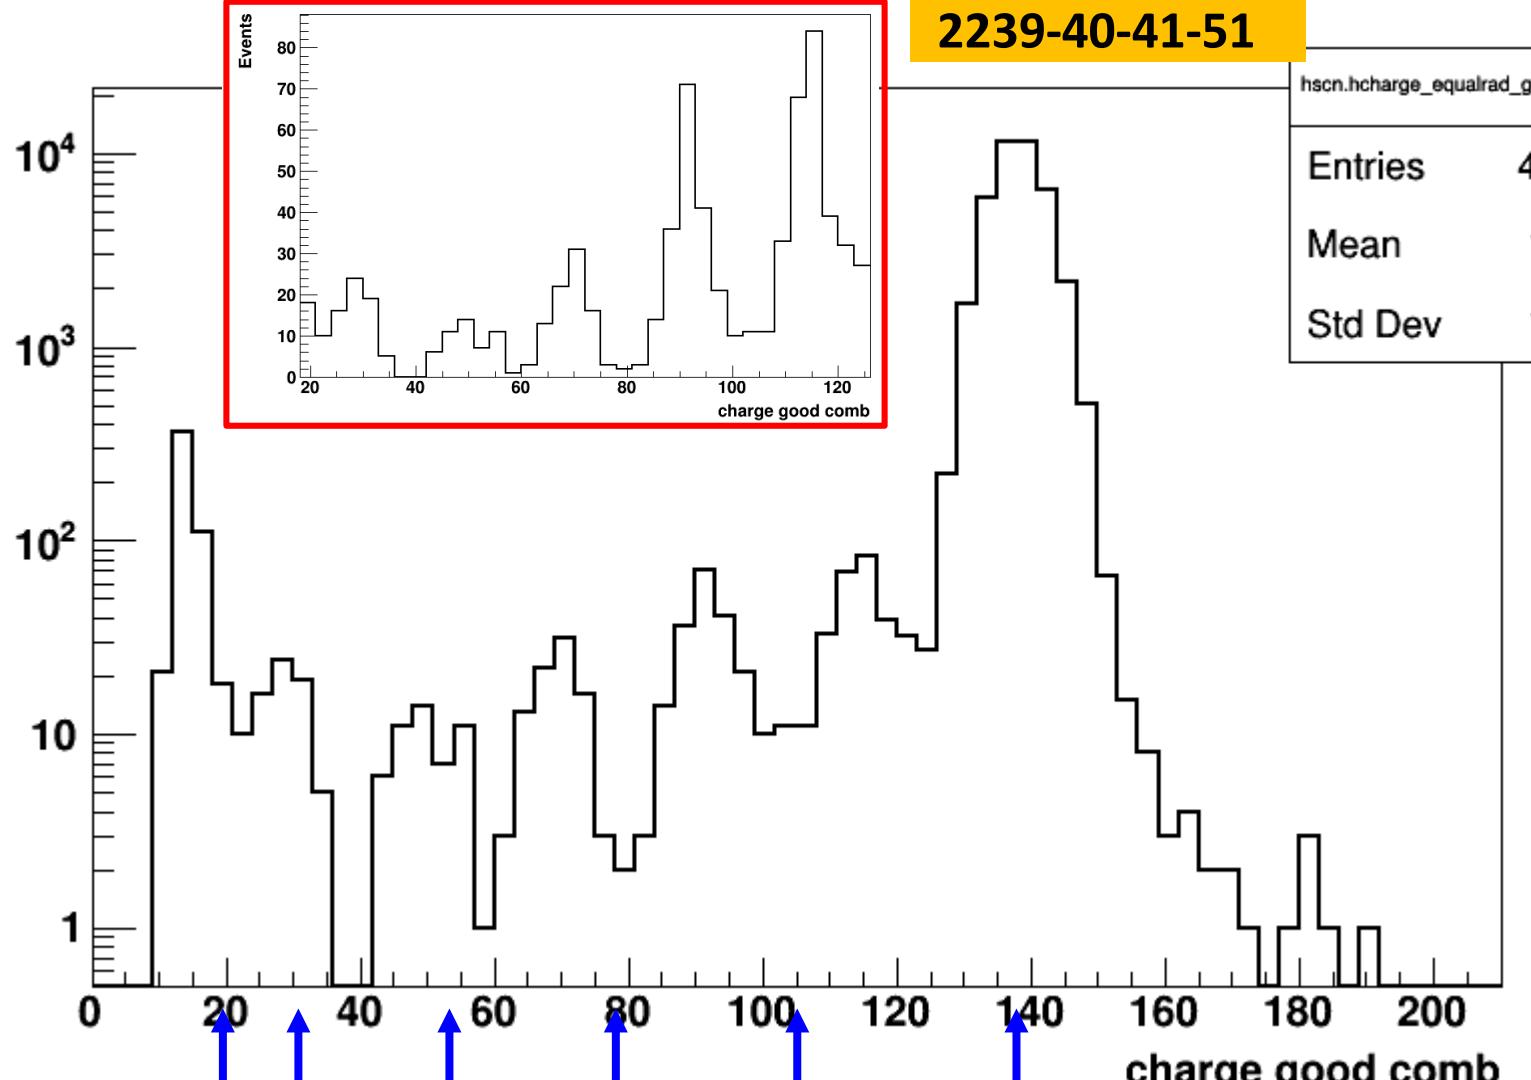

$\text{fabs}(\text{Charge}_{\text{horiz}} - \text{Charge}_{\text{vert}}) < 0.1 * (\text{Charge}_{\text{horiz}} + \text{Charge}_{\text{vert}}) / 2$  && same for Tof

Applied to RUNS 2239-40-41-51 where the Target is present

## SCN: Good combination

Events

## *BM – SCN: x and y on SCN*

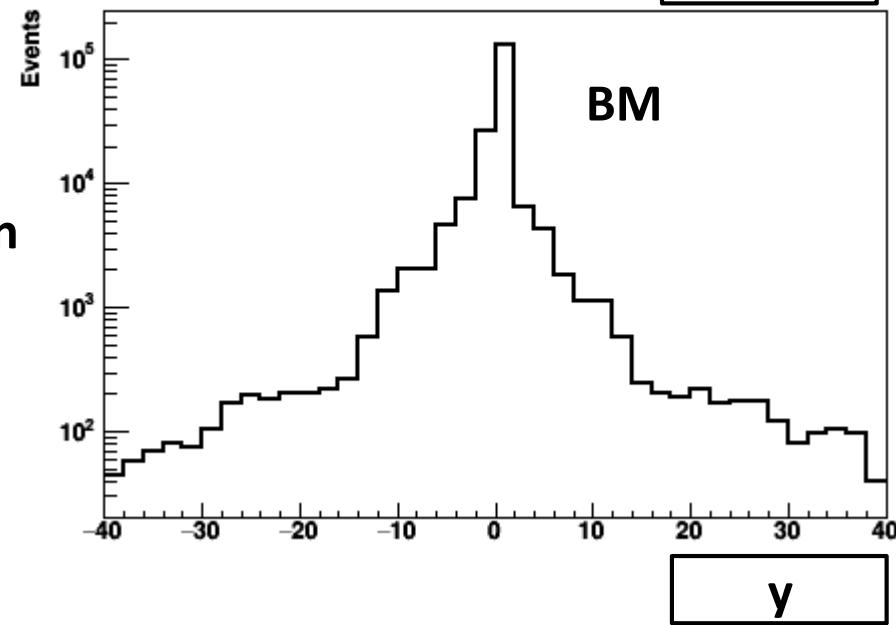

Track extrapolation on SCN

2210-11-12  
NO Target

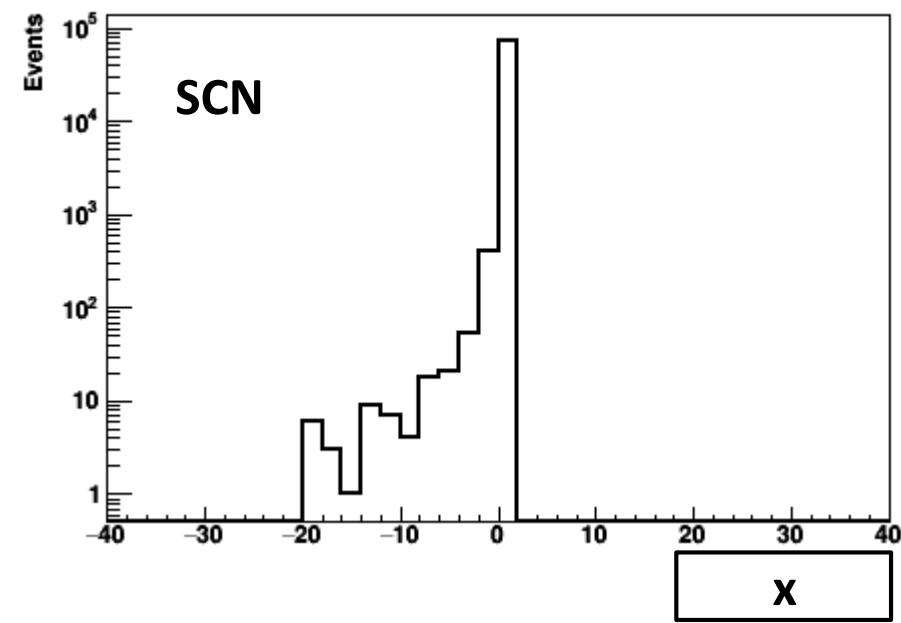

Presence of the peak at zero  
SCN active only in negative region

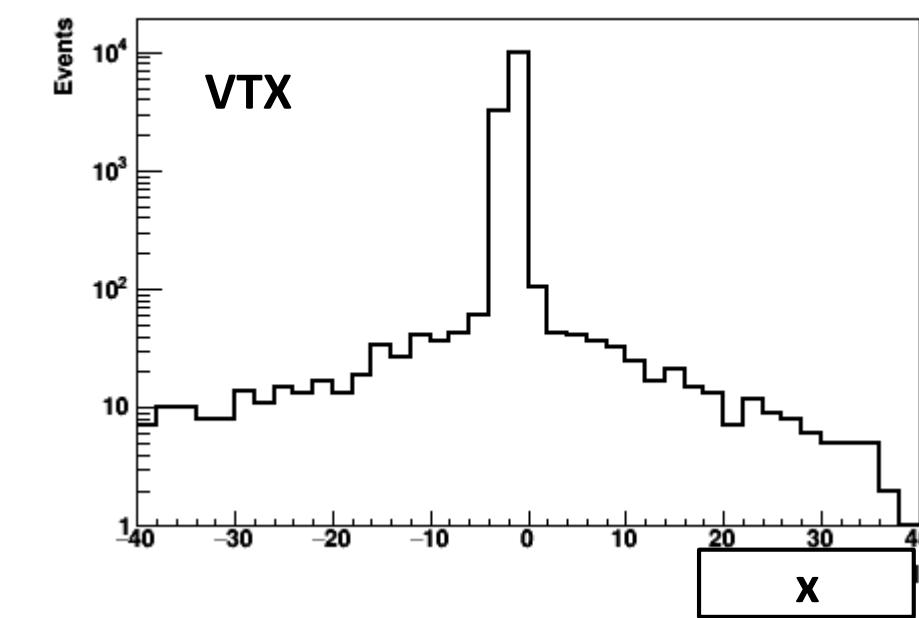

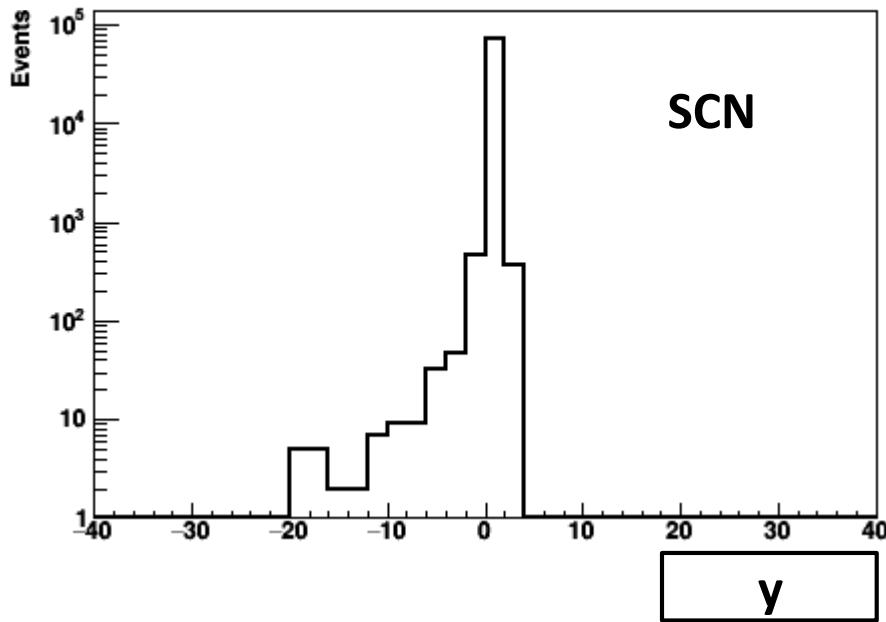

## VTX – SCN: $x$ and $y$ on SCN

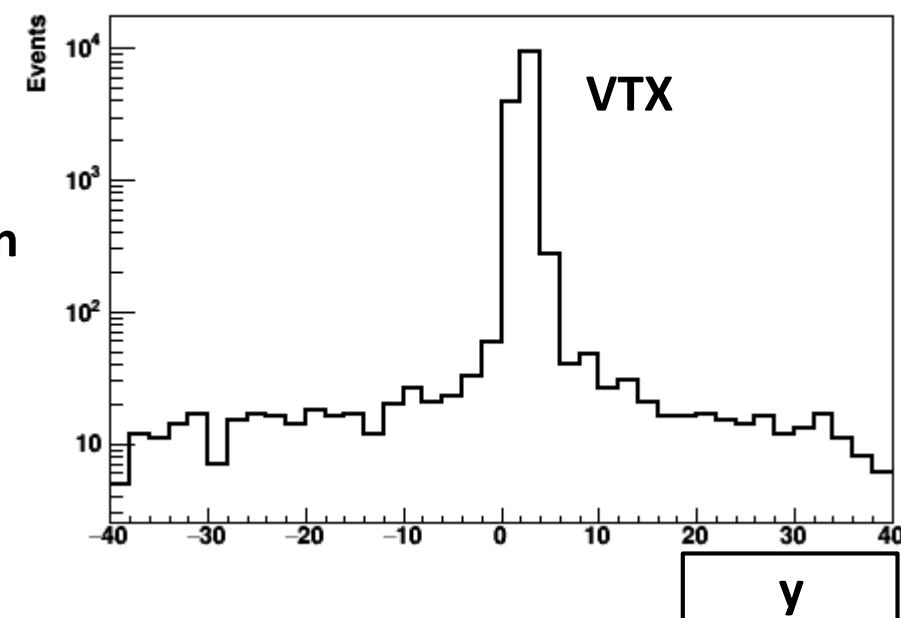

Track extrapolation on SCN

2210-11-12  
NO Target

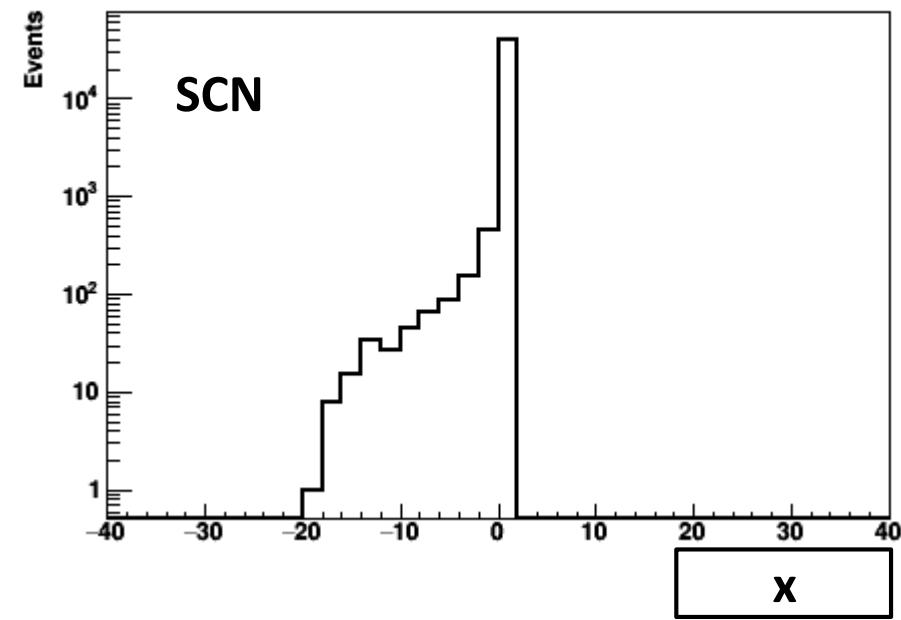

Presence of the peak at zero  
SCN active only in negative region

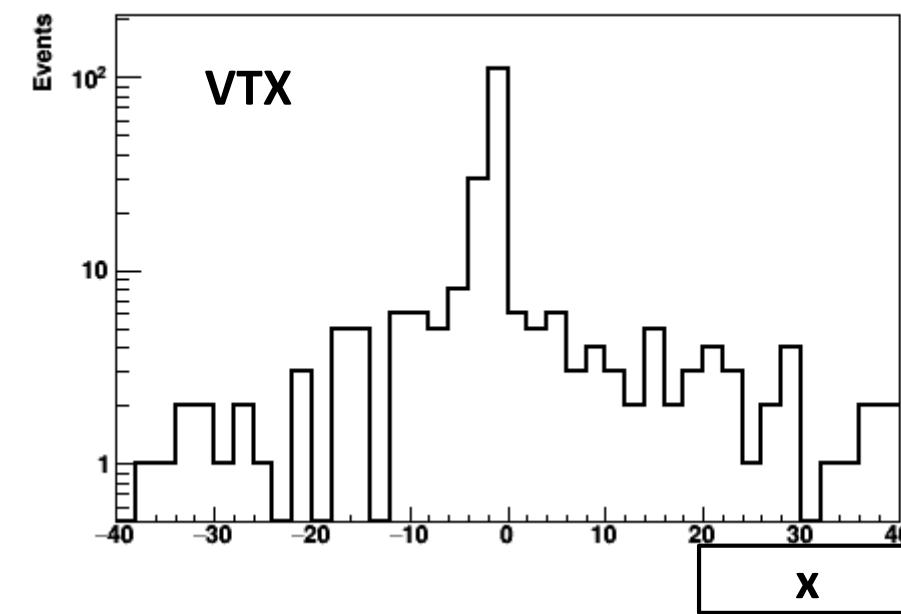

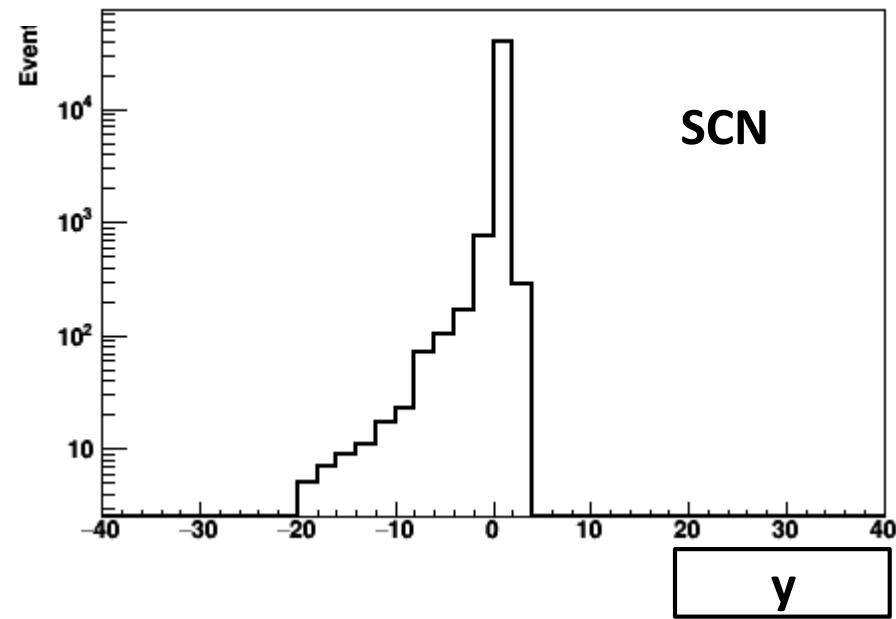

## VTX – SCN: $x$ and $y$ on SCN

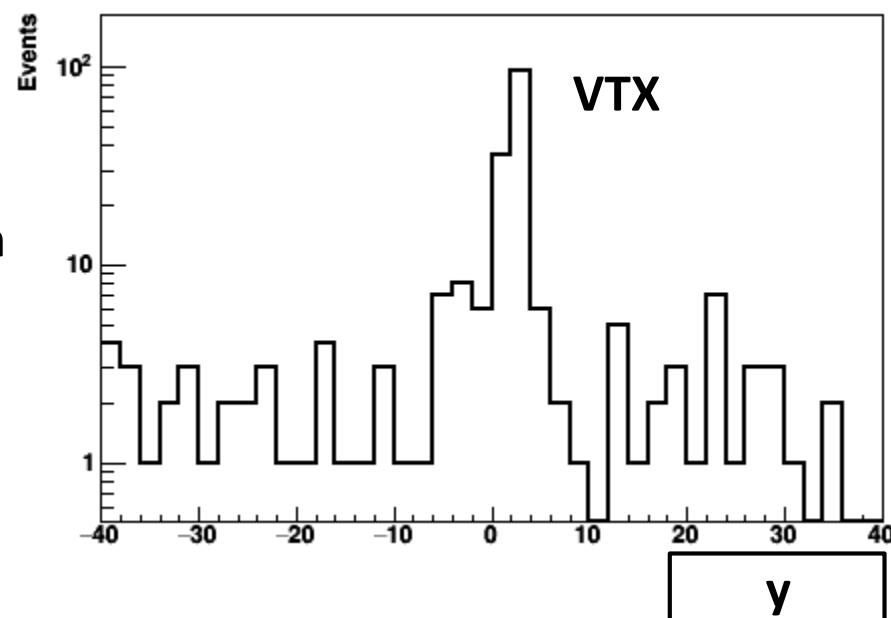

Track extrapolation on SCN

2239-40-41-51  
Target

Presence of the peak at zero  
SCN active only in negative region

## **CONCLUSIONS**

### **Analysis of the GSI data taking:**

- First data taking with SC, BM, VTX, SCN
  - SC: good efficiency, to adjust the TOF precision
  - BM: good efficiency, probably the  $\chi^2$  is too high
  - VTX: low efficiency, problems on track reconstruction
  - SCN: calibration of half channels, 2 slabs don't give signals, good charge distributions for fragmentation candidates
  - Correlation between sub-detectors:
    - BM-VTX-SCN: central peak visible
- Todo list:
  - DAQ-VTX-SCN setup in Bologna to fix problems
  - Hopefully: repeat the GSI data taking at CNAO before the end of 2019
