

dE/dx and TOF Scintillator

M. G. Bisogni, N. Belcari, N. Camarlinghi, P. Carra, E. Ciarrocchi, A. Del Guerra, M. Francesconi, L. Galli, A. C. Kraan, A. Moggi, M. Morrocchi, V. Rosso, G. Sportelli

VI FOOT Collaboration Meeting

Pavia 5-7 June 2019

Tests on Particle Identification

Aafke Kraan

The angle between the two bars and the target can be changed.
A PVT target of 4 mm was used.

Two angles were investigated:

- 8.3 deg (only protons and helium)
- 3.2 deg (up to $Z = 6$)

-The distance between the bars was set to 40 cm

(a)

(b)

Bar Calibration with Carbon

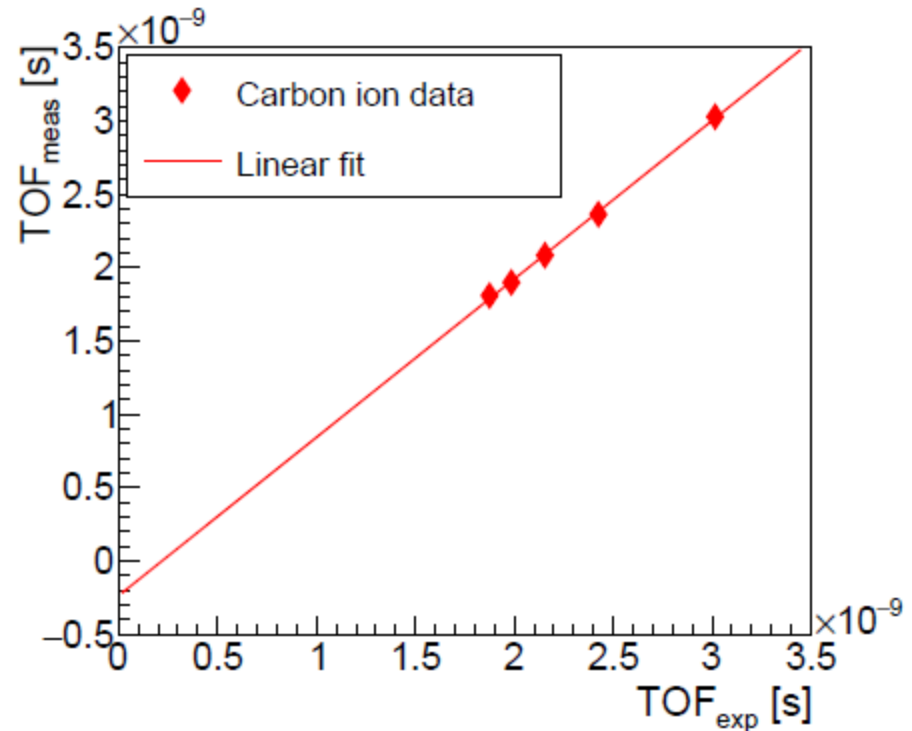

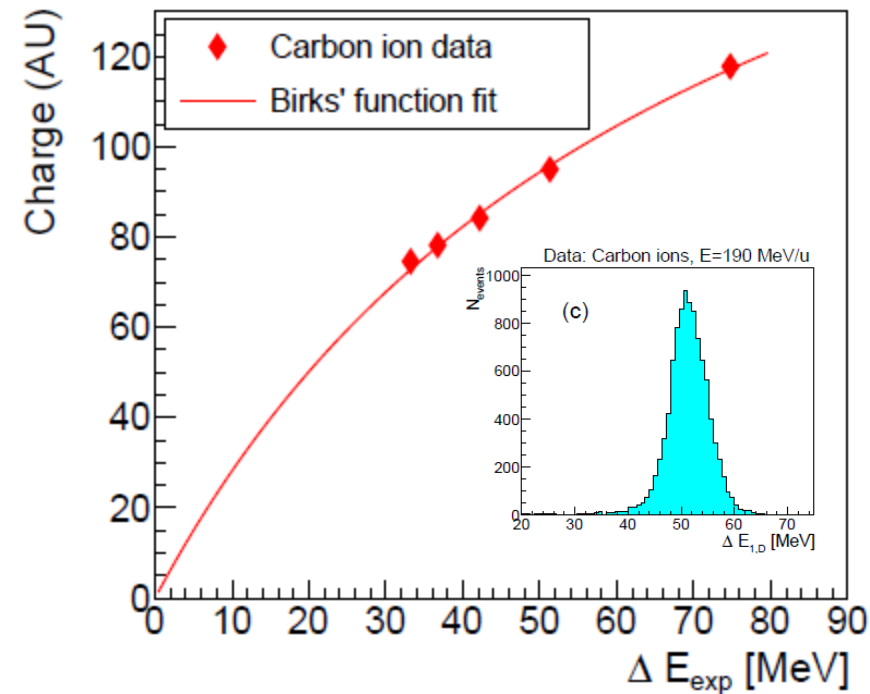

Used 5 different energies, with the beam at the center of the two bars.

$E = 115, 190, 260, 300, 400 \text{ MeV/u}$

Saturation effect fitted as:

$$Q_{i,D}^{mode} = p_{a,i} \cdot \frac{\Delta E_{i,exp}^{mode}}{1 + p_{b,i} \Delta E_{i,exp}^{mode}}$$

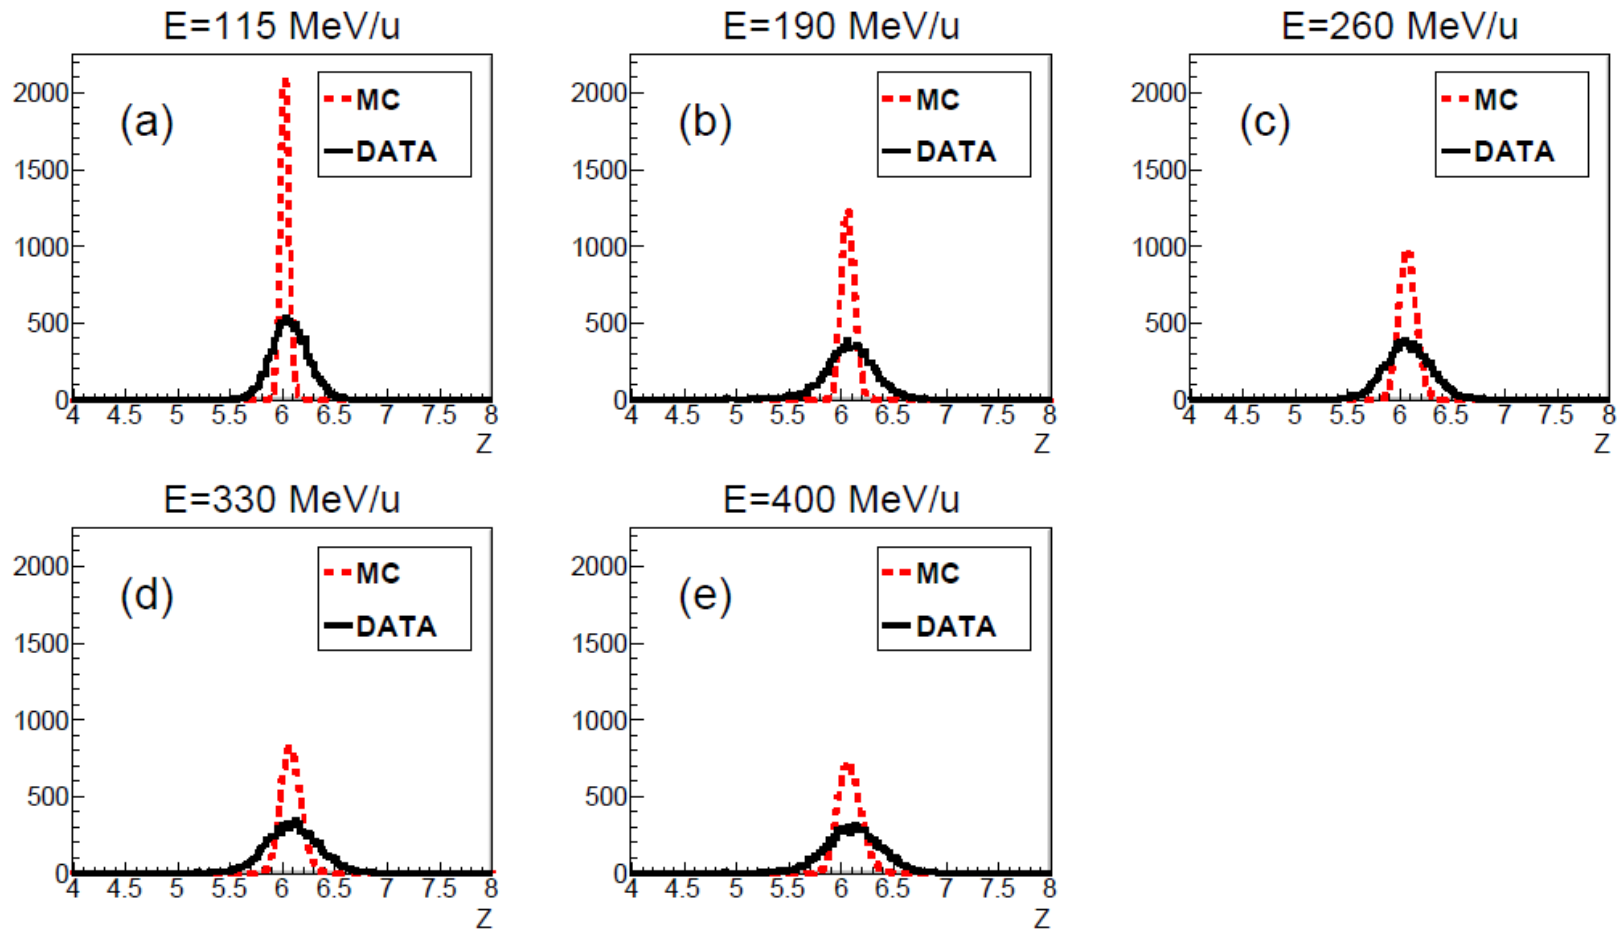

$$\Rightarrow p_{b,2} = 1.13 \times 10^{-2} \text{ MeV}^{-1}$$

Z reconstruction test

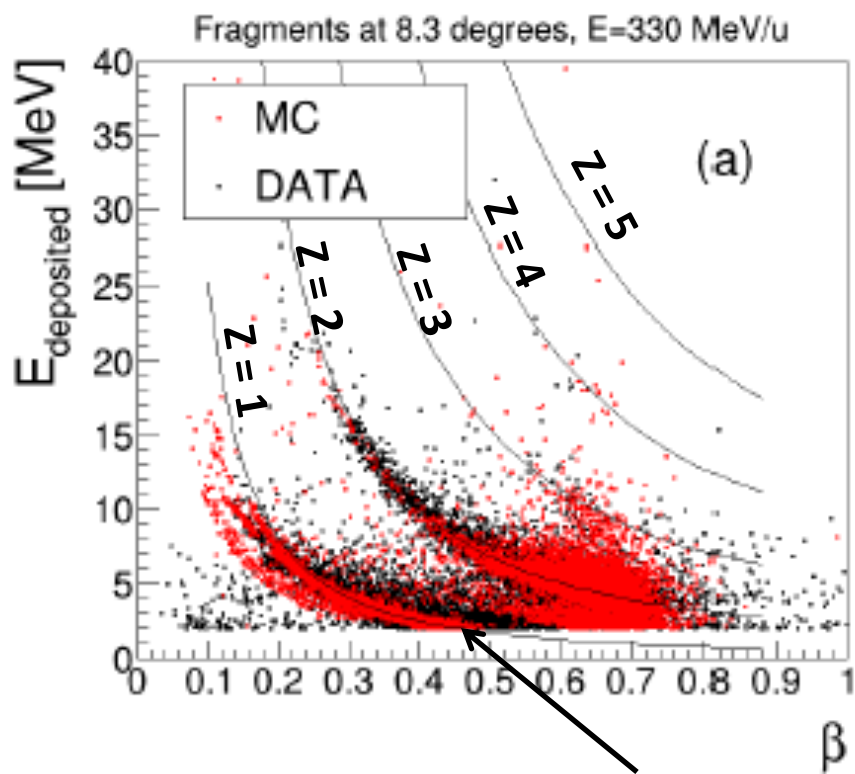

Z reconstruction performed on the calibration set.

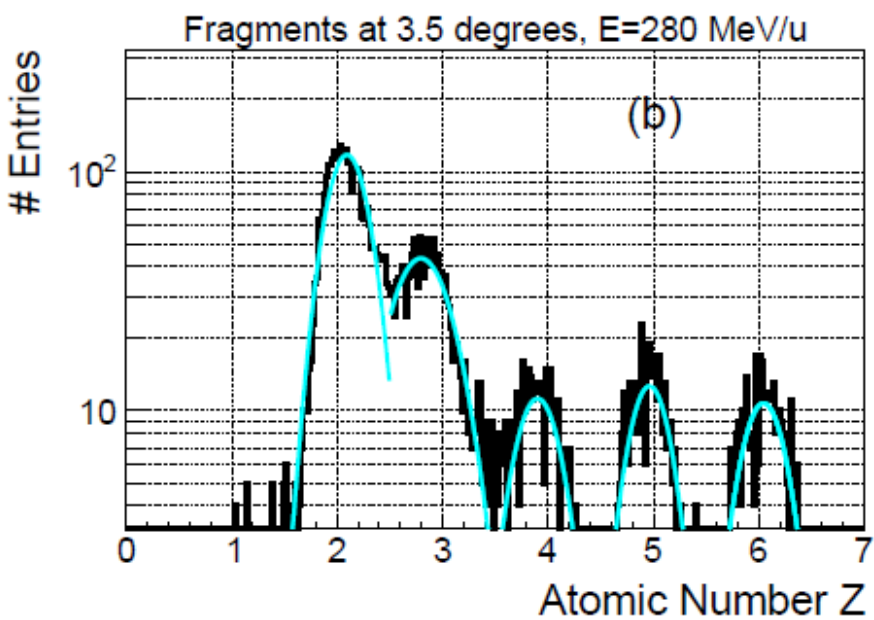

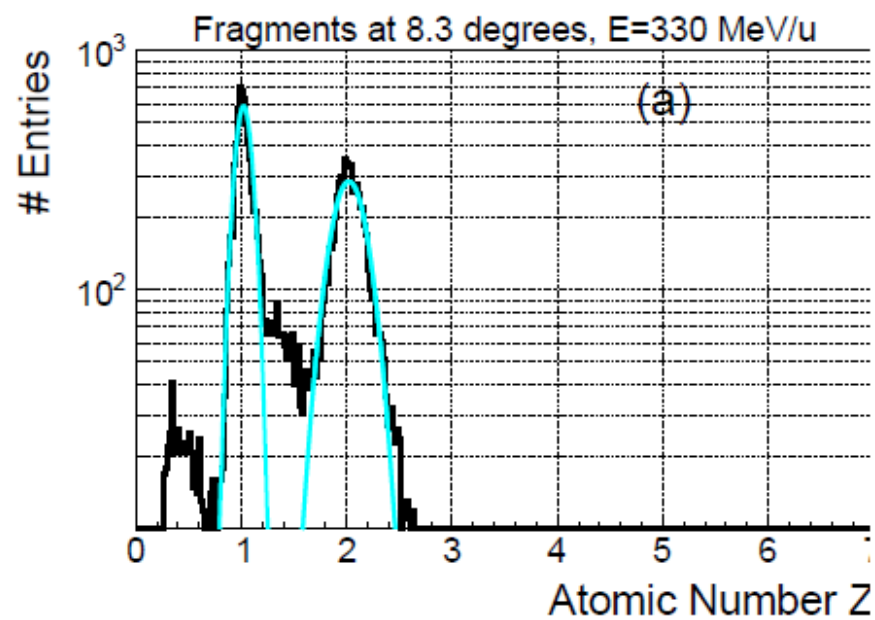

Fragmentation measurement

The same energy cut is applied to simulation and data
(2 MeV at 8.3 deg and 4 MeV at 3.2 deg)

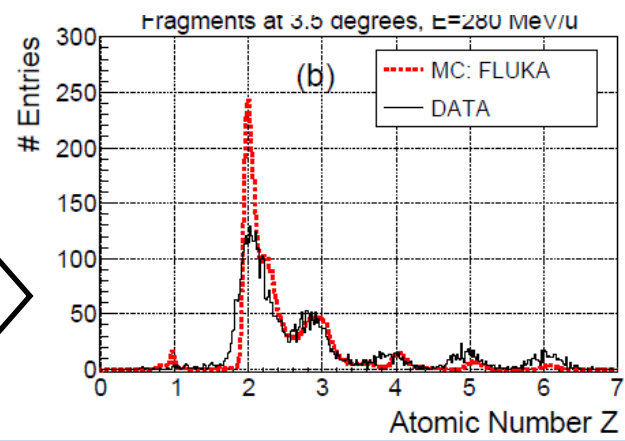

Fragmentation measurement (2)

Angle	Energy	Z	$\mu(Z)$	$\sigma(Z)$
8.3 degrees	330	1	1.02	0.08
		2	2.02	0.17
3.5 degrees	280	2	2.10	0.19
		3	2.80	0.26
		4	3.88	0.21
		5	4.94	0.19
		6	6.00	0.21

All the 6 Z can be distinguished!

Comparison of the distribution between data and simulation

Development of the final detector

Matteo Morrocchi

20 + 20 bars for an area of 40 x 40 cm²

320 SiPM read-out by 80 analog channels sampled at 4 Gsps by the WaveDAQ system

Detector Scan

Calibration of the time and energy response of each bar (analysis still ongoing)

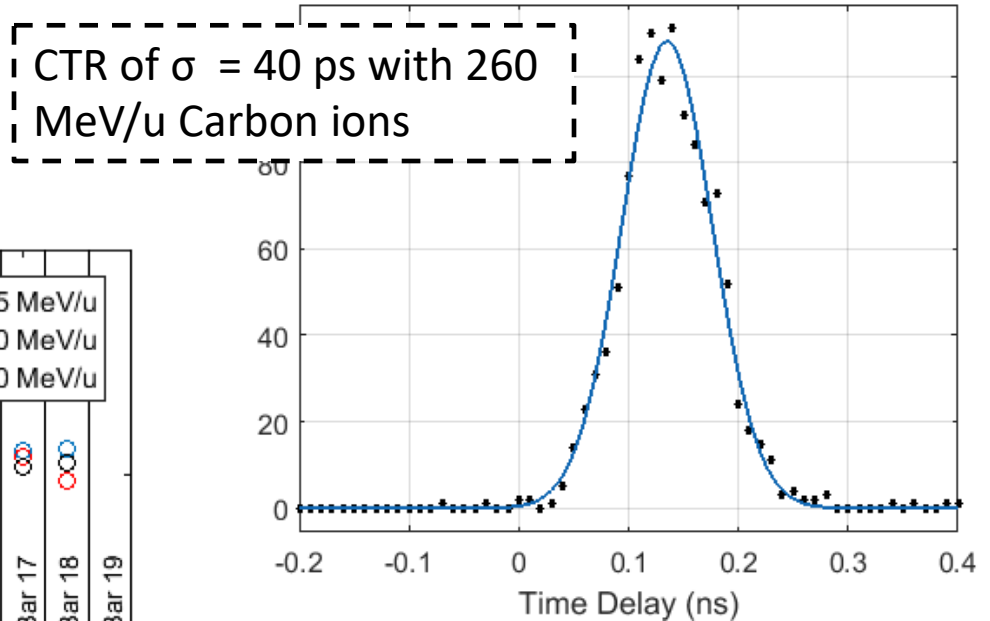

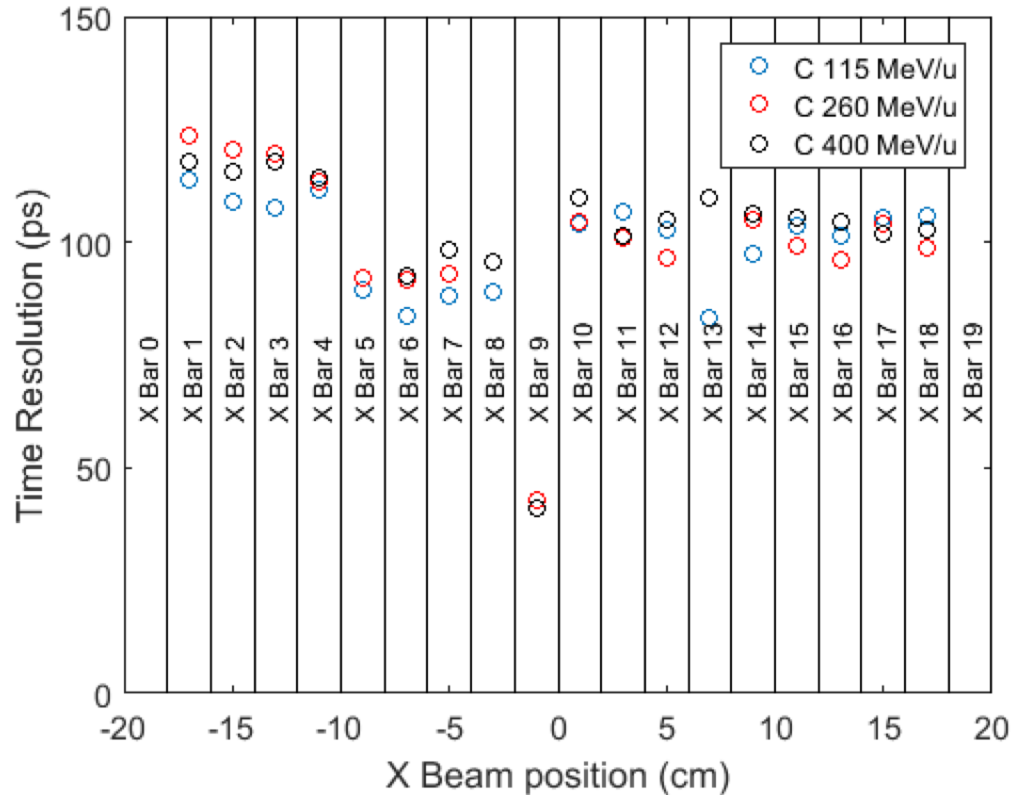

- P 60 MeV
- C 115 MeV/u
- C 260 MeV/u
- C 400 MeV/u

Time Resolution

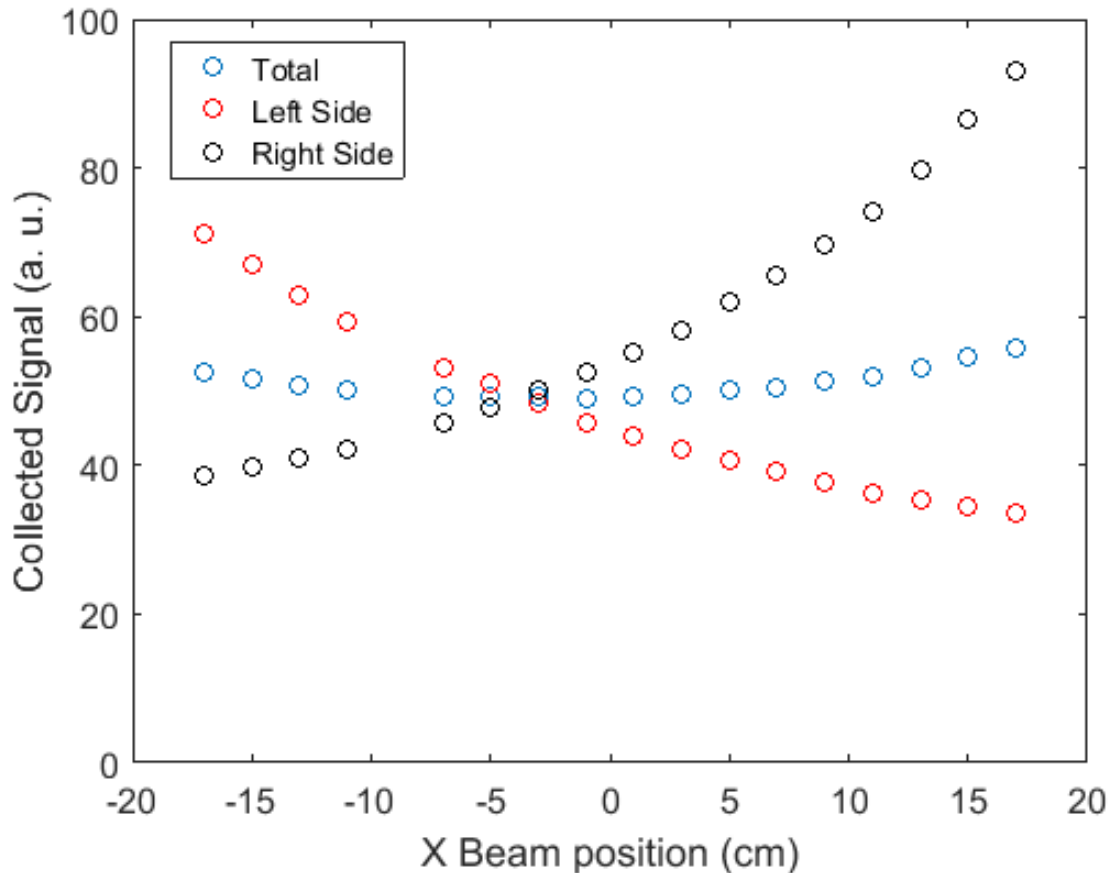

Time resolution between the two central bars of 40 ps

Time resolution involving different Wavedreams needs to be refined to take into account clock skew between boards.

Central bar scan

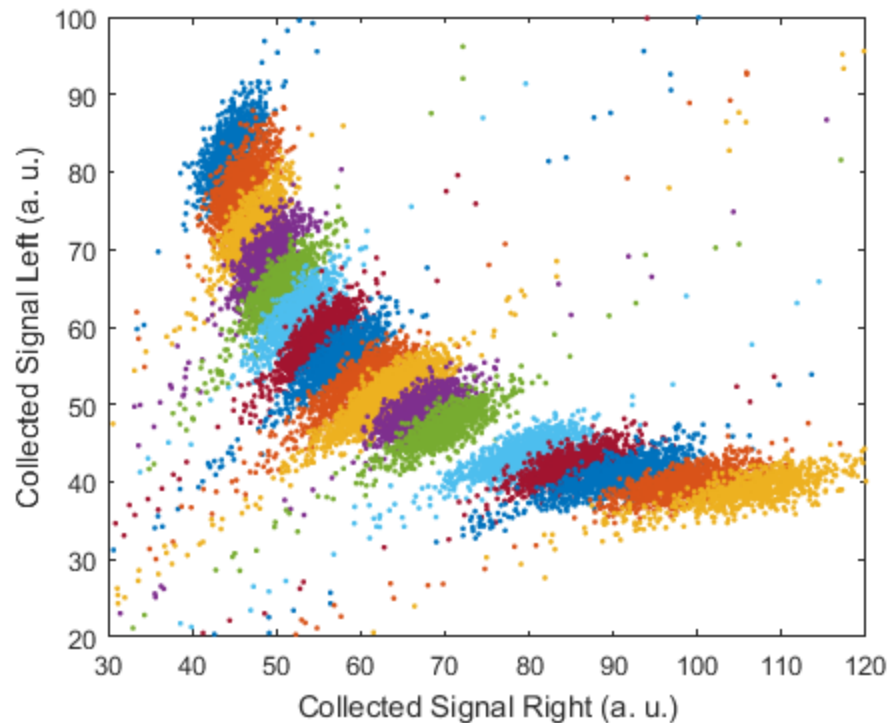

Study of the attenuation of the light in the central bar, an uniformity of response within 5% is obtained. Further correction achievable with a point-to-point calibration

Bar identification

Signal collected at the two sides of the central bar as a function of the beam position (irradiation has been performed at 2 cm step, at the center of each bar).

Bar identification (2)

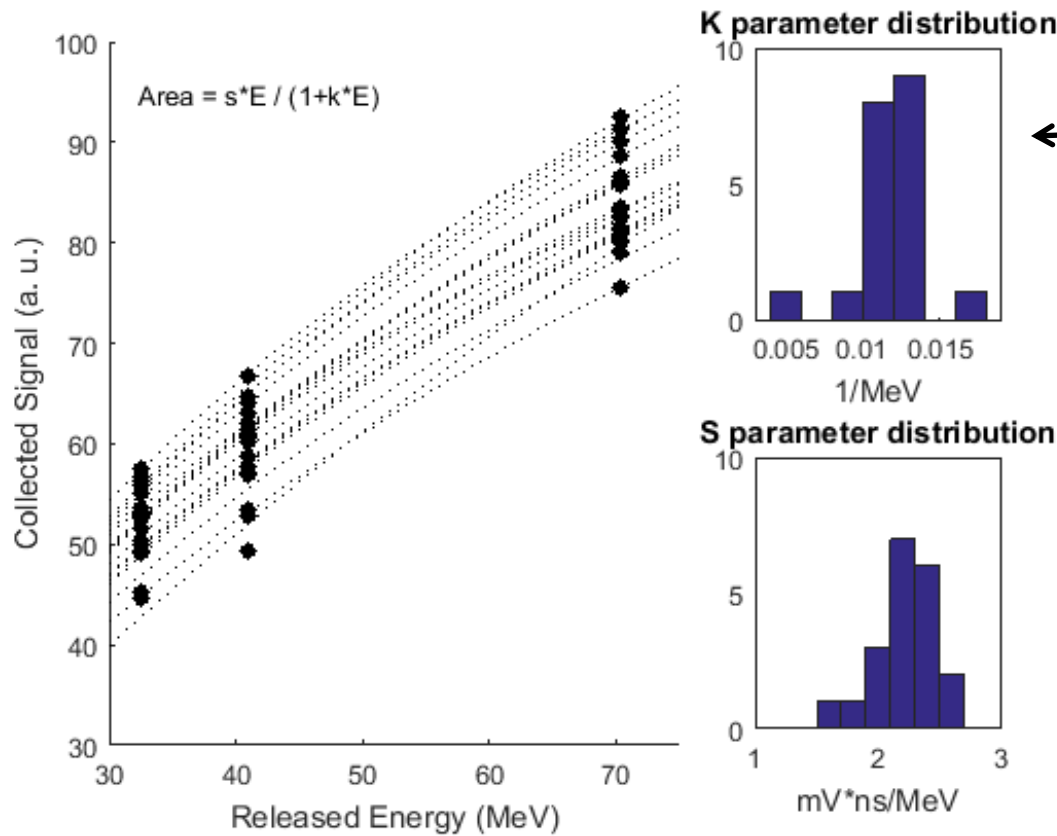

Trigger time at the two sides of the central bar as a function of the beam position (irradiation has been performed at 2 cm step, at the center of each bar).

The absolute value of the trigger time is not related to the start counter, so it is not related to the Time of Flight of the particle.

Energy Response

The slope of the saturation curve (K parameter) is compatible with the values that we obtained with the previous prototype

Calibration is not completed:
A board of the WaveDAQ needed to be replaced after calibration and some bars did not have enough statistics to perform an accurate calibration.
Another calibration will be needed in the future.

Test Beam GSI

Test of different Trigger and scan of the central bars of the whole detector with 400 MeV/u Oxygen.

Analysis still ongoing.

Trigger tests@ GSI

WaveDAQ

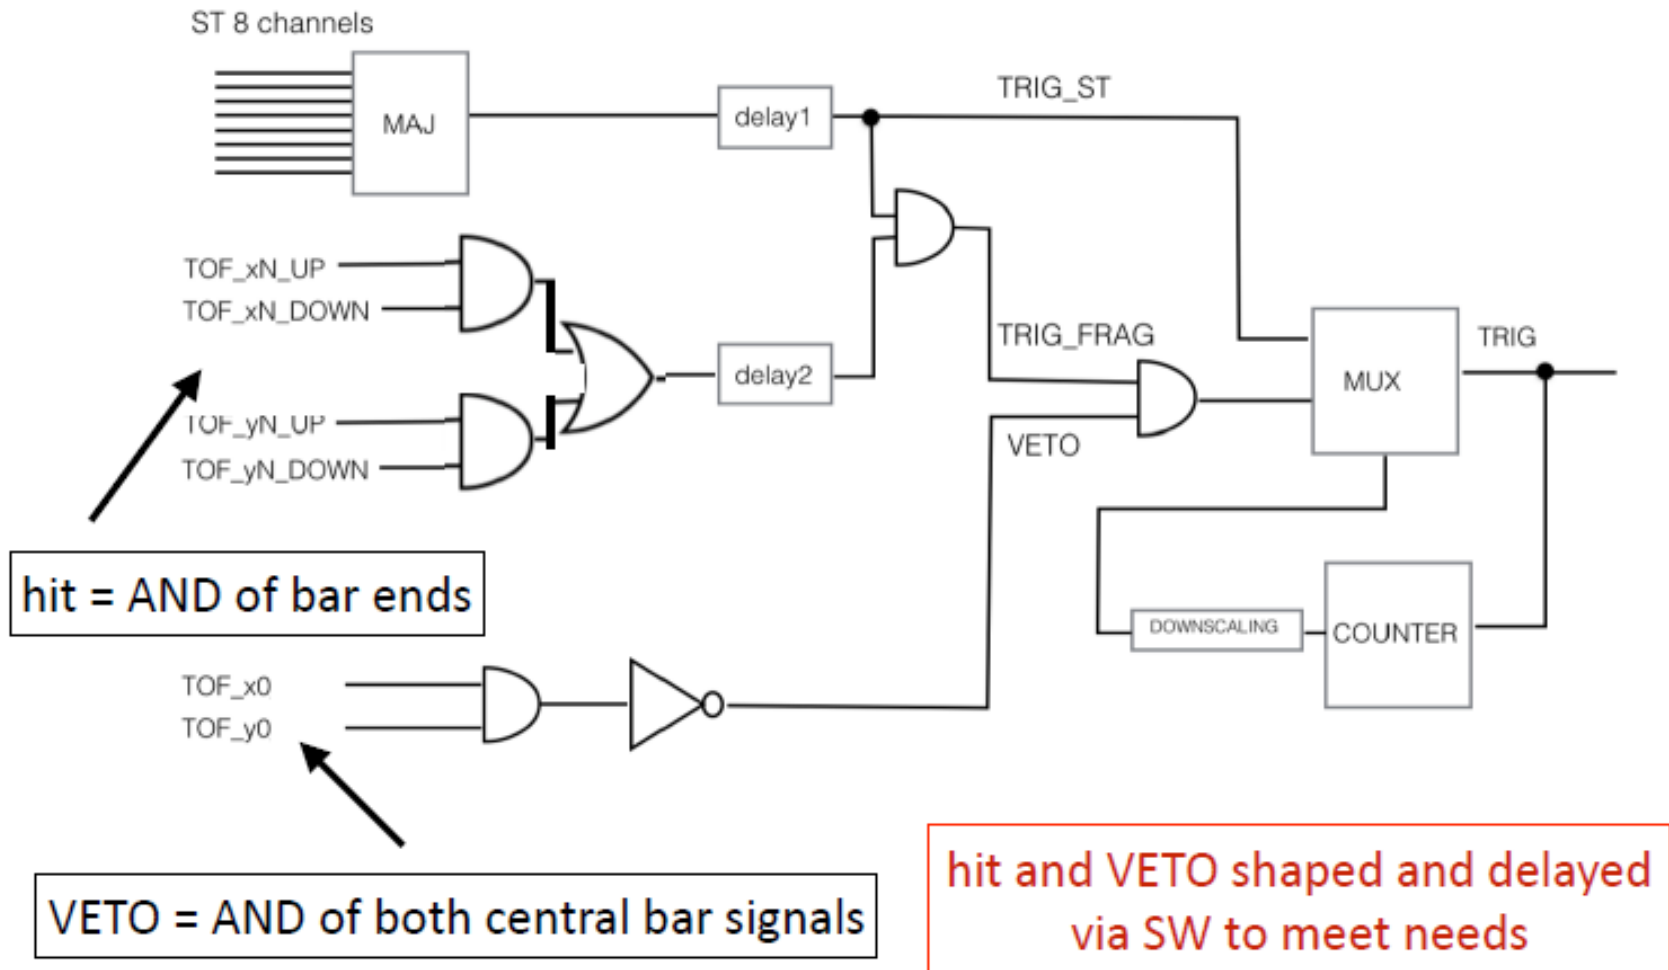

FOOT trigger @GSI

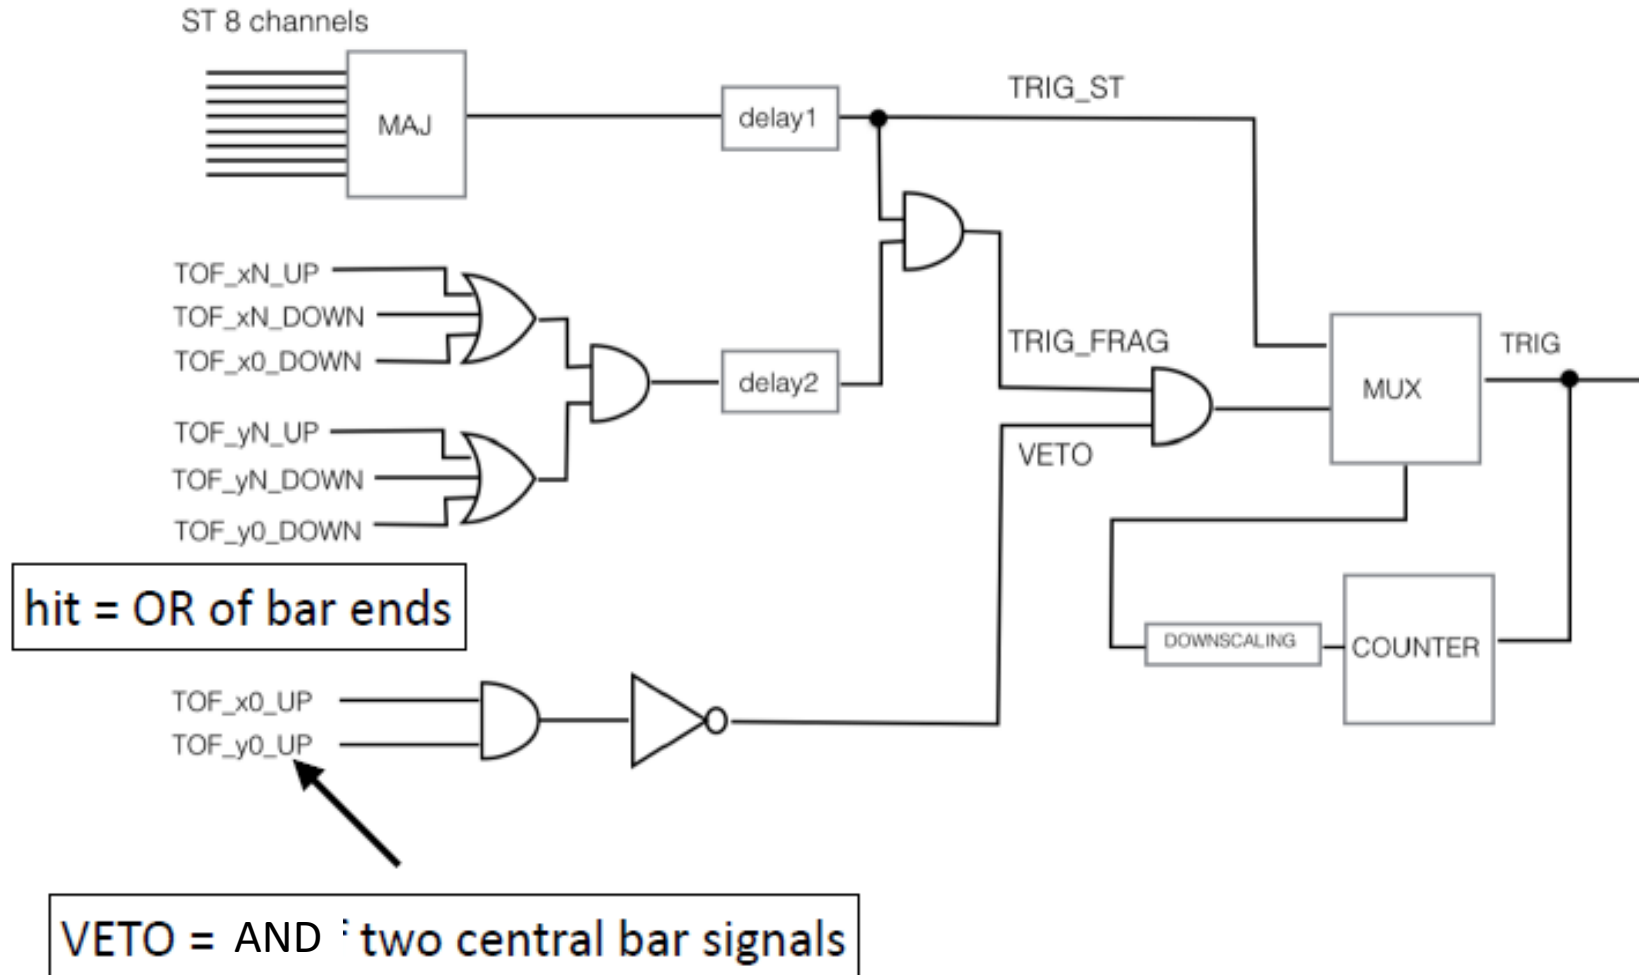

List of available online selection algorithms

- *FOOT - "Pisa version"*
- *FOOT - "Rome version"*
 - see next slides
- *Margarita majority*
 - SW programmable majority value
- *Margarita OR*
- *TOF in stand alone*
 - bar hit SW programmable as the AND or the OR of bar ends
 - TOF hit SW programmable as the AND or the OR of the X/Y views
- *pedestal*
 - 854Hz periodic trigger

FOOT trigger "Pisa"

FOOT trigger “Rome”

Comments on Trigger

- All trigger have been tested and released @GSI and in the test beam @CNAO
- Unfortunately we have no data with “properly configured” FOOT trigger
 - *at the first attempt I (Luca) misconfigured the .xml configuration file, the VETO shaper width was set to a wrong value*
 - as a result the VETO was not working at all
- The last day we fixed the configuration and measured the VETO trigger rate to be 10% of the Margarita Majority
 - *we checked both FOOT trigger versions*
 - we lost the beam when attempting the first good FOOT trigger data taking
- All the data were taken with Margarita Majority

Next steps:

- Efforts must be spent in the development of the software (SHOE) and analysis
- A new mechanics is going to be developed
- New calibration of the detector can be foreseen at the begin of the next year
- The work on the simulation of the detector is going on:
new master student in the team (Roberto Zarrella)
