The Main Idea

The Main Idea

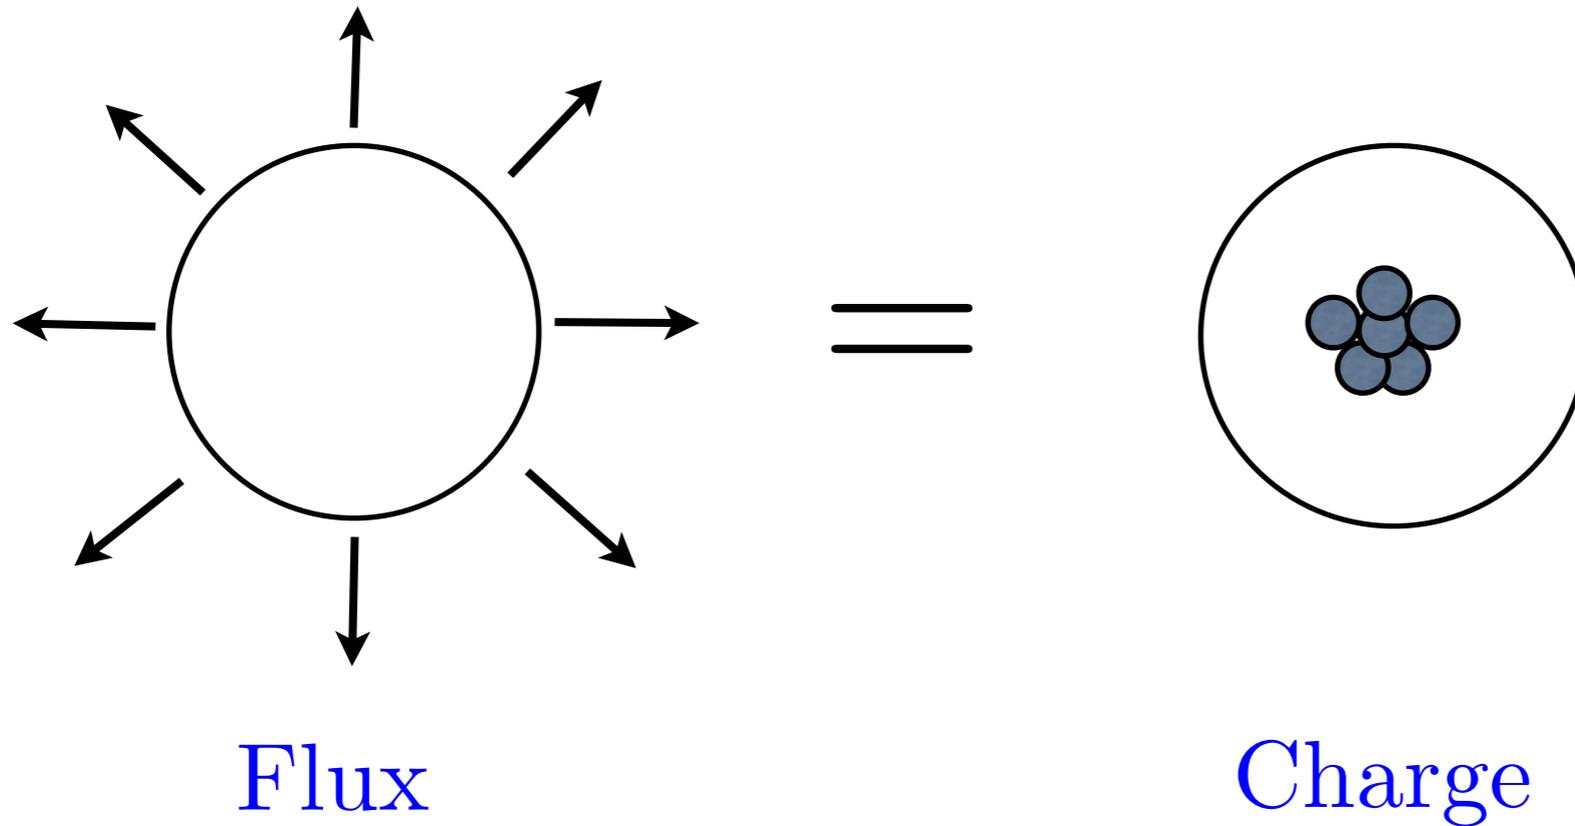

The Main Idea

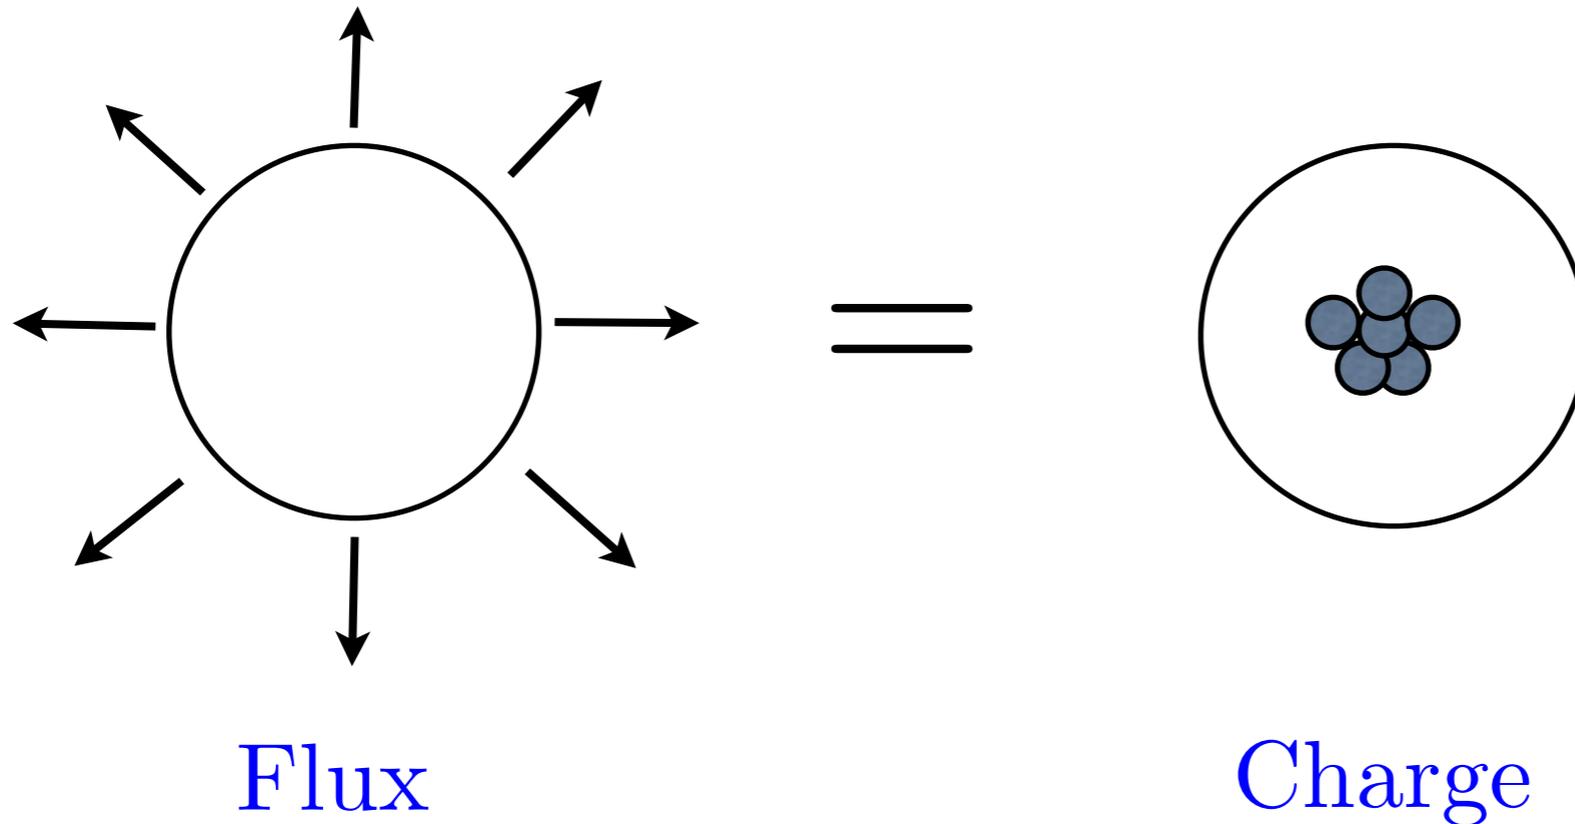

- It is a conservation law (non-Noether)

The Main Idea

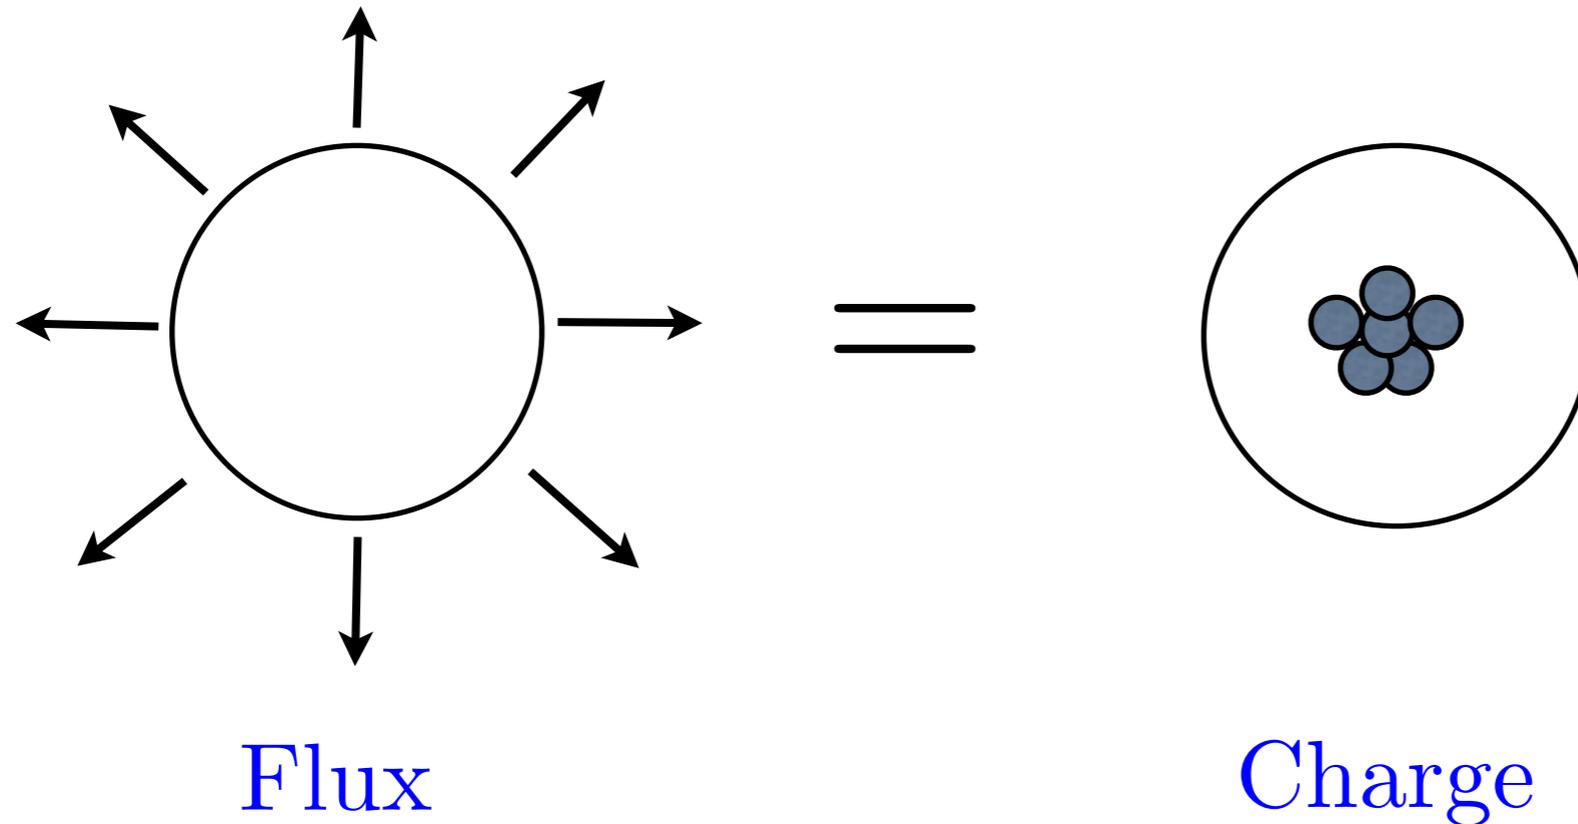

- It is a conservation law (non-Noether)
- It underlies gauge theories

The Main Idea

- It is a conservation law (non-Noether)
- It underlies gauge theories
- It underlies integrable theories

The Main Idea

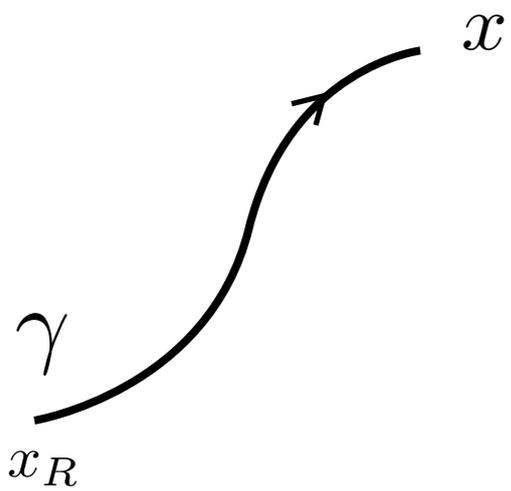

- It is a conservation law (non-Noether)
- It underlies gauge theories
- It underlies integrable theories
- Use it to construct the integral eqs. for Yang-Mills, its conserved charges and hidden symmetries in loop space

The $(1 + 1)$ -dimensional case

The $(1 + 1)$ -dimensional case

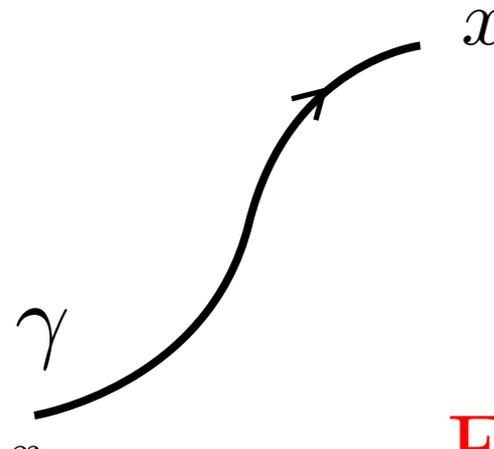

Let $g(x)$ and A_μ be functionals of the fields of the theory and impose on any curve γ the integral equation

$$g(x) g^{-1}(x_R) = P_1 e^{-\int_\gamma d\sigma A_\mu \frac{dx^\mu}{d\sigma}}$$

The (1 + 1)-dimensional case

Let $g(x)$ and A_μ be functionals of the fields of the theory and impose on any curve γ the integral equation

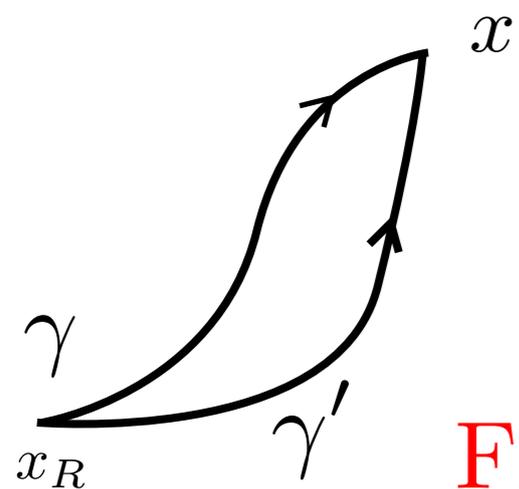

A diagram showing a curved arrow labeled γ starting at a point labeled x_R and ending at a point labeled x . The arrow points from the bottom-left towards the top-right.

$$g(x) g^{-1}(x_R) = P_1 e^{-\int_\gamma d\sigma A_\mu \frac{dx^\mu}{d\sigma}}$$

Flux ← ← **charge**

The (1 + 1)-dimensional case

Let $g(x)$ and A_μ be functionals of the fields of the theory and impose on any curve γ the integral equation

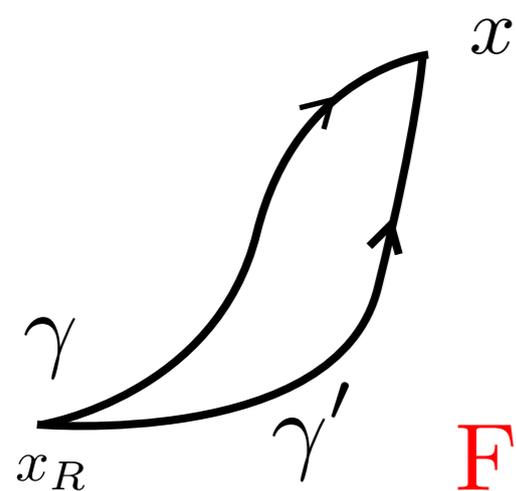

$$\text{Flux} \rightarrow g(x) g^{-1}(x_R) = P_1 e^{-\int_\gamma d\sigma A_\mu \frac{dx^\mu}{d\sigma}}$$
$$\rightarrow = P_1 e^{-\int_{\gamma'} d\sigma A_\mu \frac{dx^\mu}{d\sigma}} \leftarrow \text{charge}$$

path independent

charge

The (1 + 1)-dimensional case

Let $g(x)$ and A_μ be functionals of the fields of the theory and impose on any curve γ the integral equation

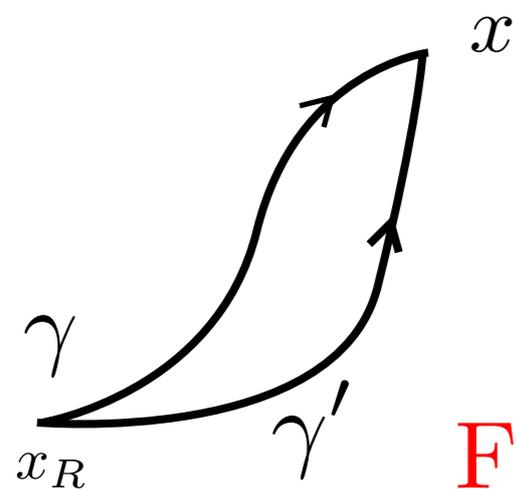

$$\begin{aligned}
 \text{Flux} \quad g(x) g^{-1}(x_R) &= P_1 e^{-\int_\gamma d\sigma A_\mu \frac{dx^\mu}{d\sigma}} \\
 &= P_1 e^{-\int_{\gamma'} d\sigma A_\mu \frac{dx^\mu}{d\sigma}} \quad \text{charge}
 \end{aligned}$$

path independent

Take γ infinitesimal $\longrightarrow A_\mu = -\partial_\mu g g^{-1}$

The (1 + 1)-dimensional case

Let $g(x)$ and A_μ be functionals of the fields of the theory and impose on any curve γ the integral equation

$$\begin{aligned}
 \text{Flux} \quad g(x) g^{-1}(x_R) &= P_1 e^{-\int_\gamma d\sigma A_\mu \frac{dx^\mu}{d\sigma}} \\
 &= P_1 e^{-\int_{\gamma'} d\sigma A_\mu \frac{dx^\mu}{d\sigma}} \quad \text{charge}
 \end{aligned}$$

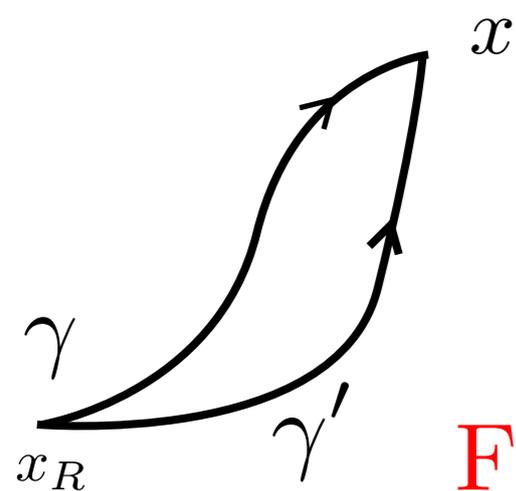

path independent

Take γ infinitesimal $\longrightarrow A_\mu = -\partial_\mu g g^{-1}$

A_μ is flat $\longrightarrow F_{\mu\nu} \equiv \partial_\mu A_\nu - \partial_\nu A_\mu + [A_\mu, A_\nu] = 0$

The $(1 + 1)$ -dimensional case

Let $g(x)$ and A_μ be functionals of the fields of the theory and impose on any curve γ the integral equation

$$\begin{aligned}
 \text{Flux} \quad g(x) g^{-1}(x_R) &= P_1 e^{-\int_\gamma d\sigma A_\mu \frac{dx^\mu}{d\sigma}} \\
 &= P_1 e^{-\int_{\gamma'} d\sigma A_\mu \frac{dx^\mu}{d\sigma}} \quad \text{charge}
 \end{aligned}$$

path independent

Take γ infinitesimal $\longrightarrow A_\mu = -\partial_\mu g g^{-1}$

A_μ is flat $\longrightarrow F_{\mu\nu} \equiv \partial_\mu A_\nu - \partial_\nu A_\mu + [A_\mu, A_\nu] = 0$

Lax-Zakharov-Shabat equation

That is what integrable theories are about

The sine-Gordon model

The sine-Gordon model

$$A_0 = \frac{i}{4} \begin{pmatrix} \frac{\partial \theta}{\partial x^1} & \frac{\omega}{c} \left(e^{i\theta/2} + \frac{1}{\lambda} e^{-i\theta/2} \right) \\ \frac{\omega}{c} \left(e^{i\theta/2} + \lambda e^{-i\theta/2} \right) & -\frac{\partial \theta}{\partial x^1} \end{pmatrix}$$

$$A_1 = \frac{i}{4} \begin{pmatrix} \frac{\partial \theta}{\partial x^0} & \frac{\omega}{c} \left(e^{i\theta/2} - \frac{1}{\lambda} e^{-i\theta/2} \right) \\ -\frac{\omega}{c} \left(e^{i\theta/2} - \lambda e^{-i\theta/2} \right) & -\frac{\partial \theta}{\partial x^0} \end{pmatrix}$$

$$x^0 = ct$$

$$x^1 = x$$

The sine-Gordon model

$$A_0 = \frac{i}{4} \begin{pmatrix} \frac{\partial \theta}{\partial x^1} & \frac{\omega}{c} \left(e^{i\theta/2} + \frac{1}{\lambda} e^{-i\theta/2} \right) \\ \frac{\omega}{c} \left(e^{i\theta/2} + \lambda e^{-i\theta/2} \right) & -\frac{\partial \theta}{\partial x^1} \end{pmatrix}$$

$$A_1 = \frac{i}{4} \begin{pmatrix} \frac{\partial \theta}{\partial x^0} & \frac{\omega}{c} \left(e^{i\theta/2} - \frac{1}{\lambda} e^{-i\theta/2} \right) \\ -\frac{\omega}{c} \left(e^{i\theta/2} - \lambda e^{-i\theta/2} \right) & -\frac{\partial \theta}{\partial x^0} \end{pmatrix} \quad \begin{array}{l} x^0 = ct \\ x^1 = x \end{array}$$

Note that λ is arbitrary

$$F_{01} \equiv \partial_0 A_1 - \partial_1 A_0 + [A_0, A_1] = \frac{i}{4} \left(\partial_0^2 \theta - \partial_1^2 \theta + \frac{\omega^2}{c^2} \sin \theta \right) \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

The sine-Gordon model

$$A_0 = \frac{i}{4} \begin{pmatrix} \frac{\partial \theta}{\partial x^1} & \frac{\omega}{c} \left(e^{i\theta/2} + \frac{1}{\lambda} e^{-i\theta/2} \right) \\ \frac{\omega}{c} \left(e^{i\theta/2} + \lambda e^{-i\theta/2} \right) & -\frac{\partial \theta}{\partial x^1} \end{pmatrix}$$

$$A_1 = \frac{i}{4} \begin{pmatrix} \frac{\partial \theta}{\partial x^0} & \frac{\omega}{c} \left(e^{i\theta/2} - \frac{1}{\lambda} e^{-i\theta/2} \right) \\ -\frac{\omega}{c} \left(e^{i\theta/2} - \lambda e^{-i\theta/2} \right) & -\frac{\partial \theta}{\partial x^0} \end{pmatrix} \quad \begin{array}{l} x^0 = ct \\ x^1 = x \end{array}$$

Note that λ is arbitrary

$$F_{01} \equiv \partial_0 A_1 - \partial_1 A_0 + [A_0, A_1] = \frac{i}{4} \left(\partial_0^2 \theta - \partial_1^2 \theta + \frac{\omega^2}{c^2} \sin \theta \right) \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}$$

Loop Algebra $[T_i^m, T_j^n] = i \varepsilon_{ijk} T_k^{m+n} \quad (T_i^n = \lambda^n T_i)$

hidden symmetries

Kac-Moody Alg. $[T_i^m, T_j^n] = i \varepsilon_{ijk} T_k^{m+n} + C m \delta_{m+n,0} \delta_{i,j}$

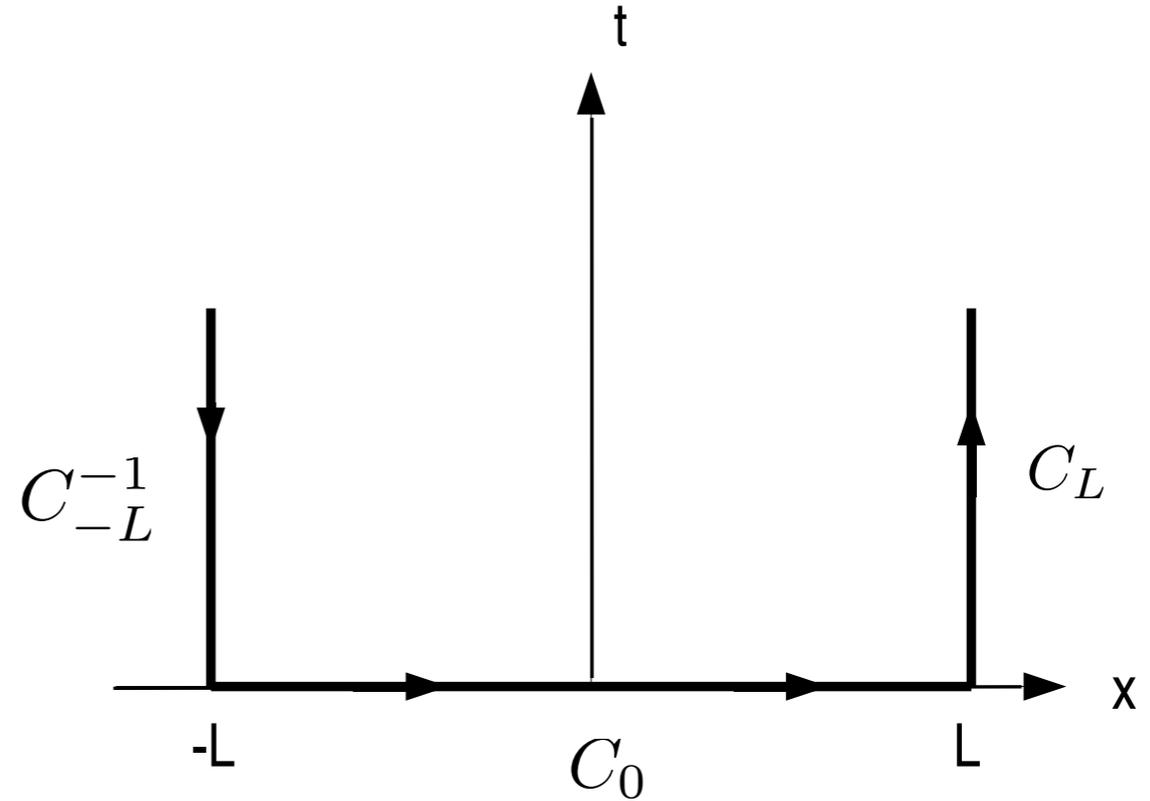

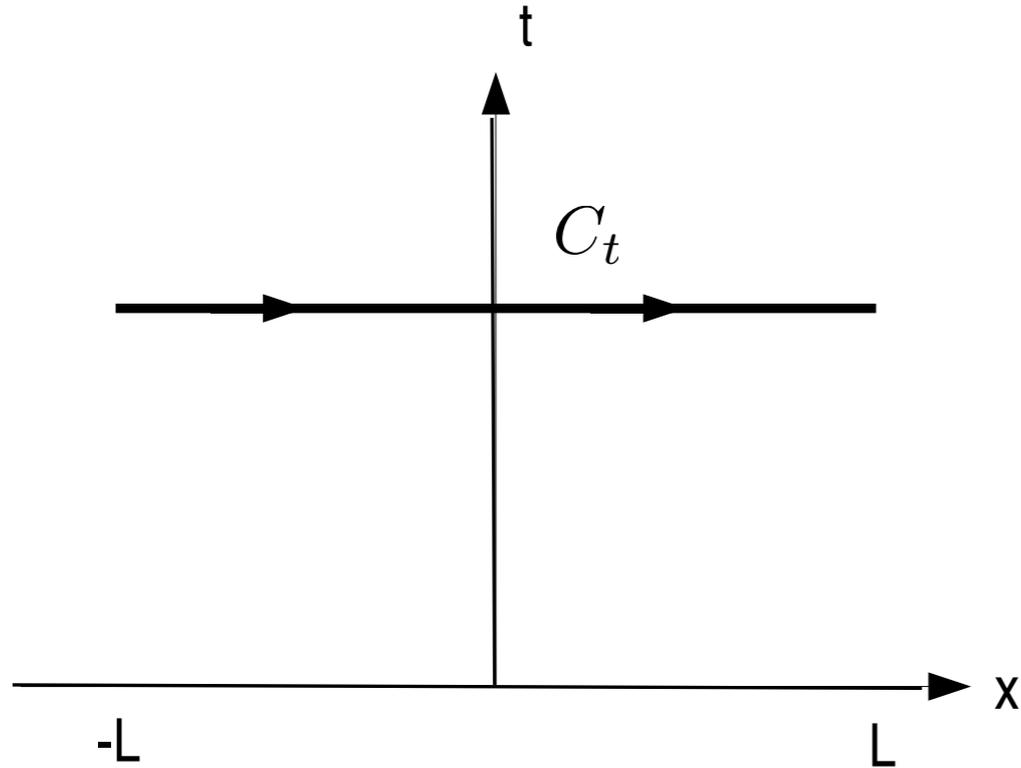

Path independency

Path independency

$F_{\mu\nu} = 0$ means that $W = P e^{-\int_{\gamma} d\sigma A_{\mu} \frac{d x^{\mu}}{d \sigma}}$ is path independent

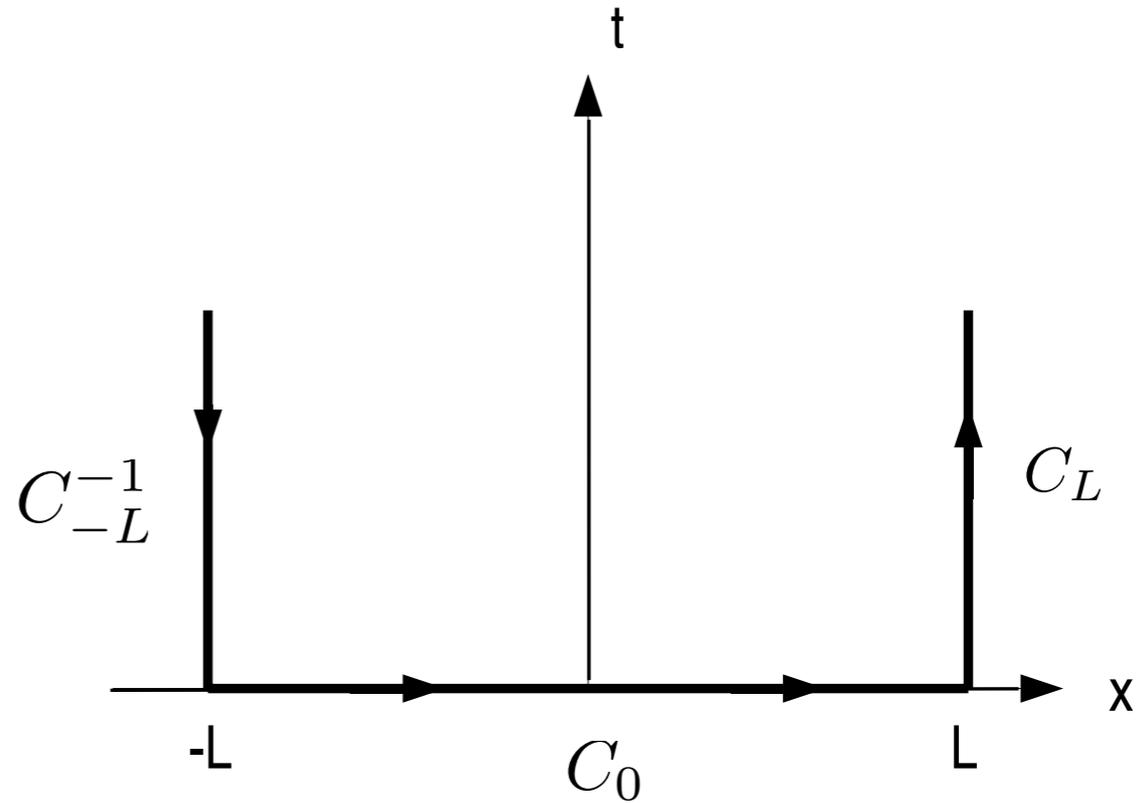

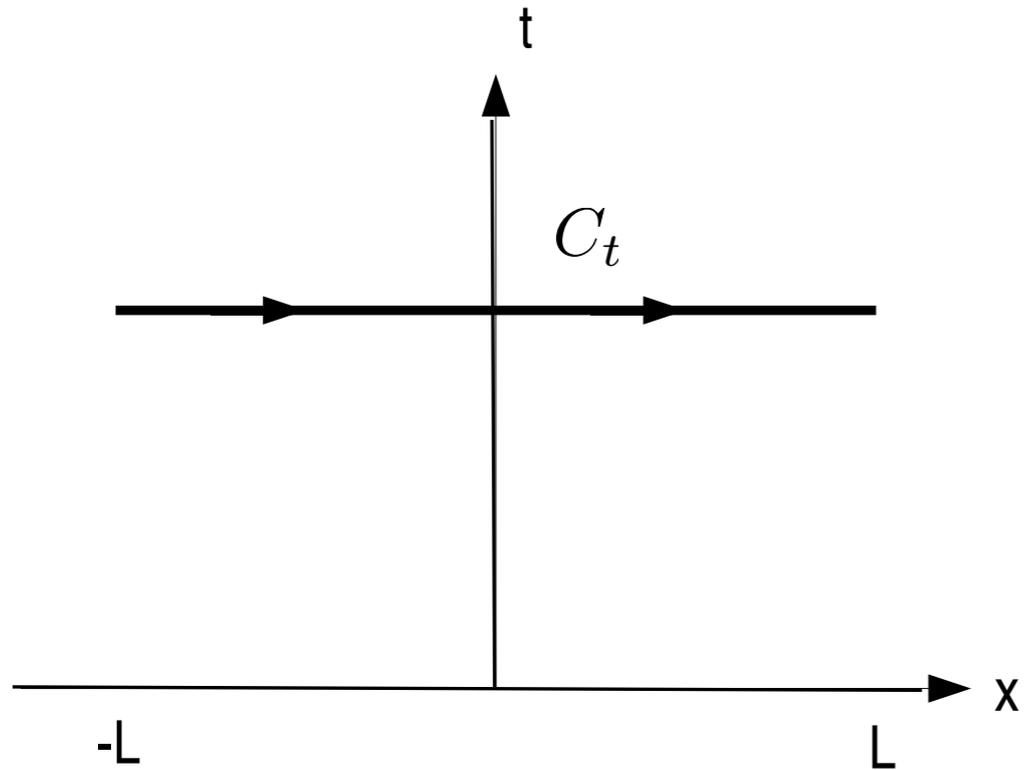

Path independency

$F_{\mu\nu} = 0$ means that $W = P e^{-\int_{\gamma} d\sigma A_{\mu} \frac{d x^{\mu}}{d \sigma}}$ is path independent

Path independency

$F_{\mu\nu} = 0$ means that $W = P e^{-\int_{\gamma} d\sigma A_{\mu} \frac{d x^{\mu}}{d \sigma}}$ is path independent

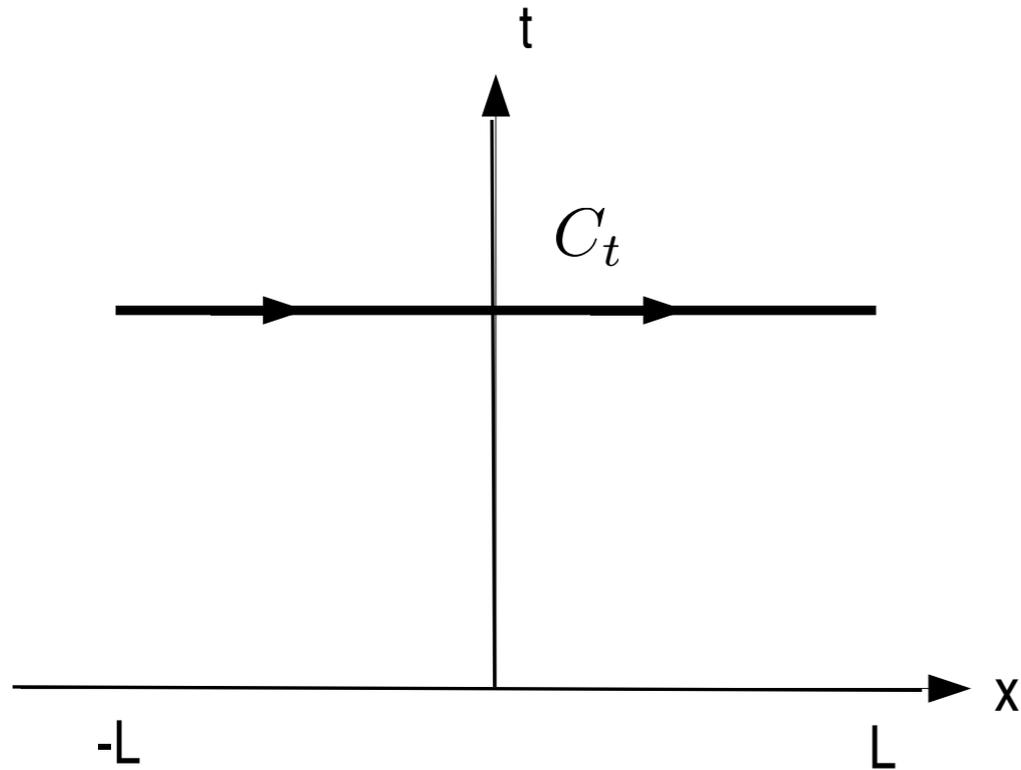

Boundary Condition

$$A_t(-L, t) = A_t(L, t)$$

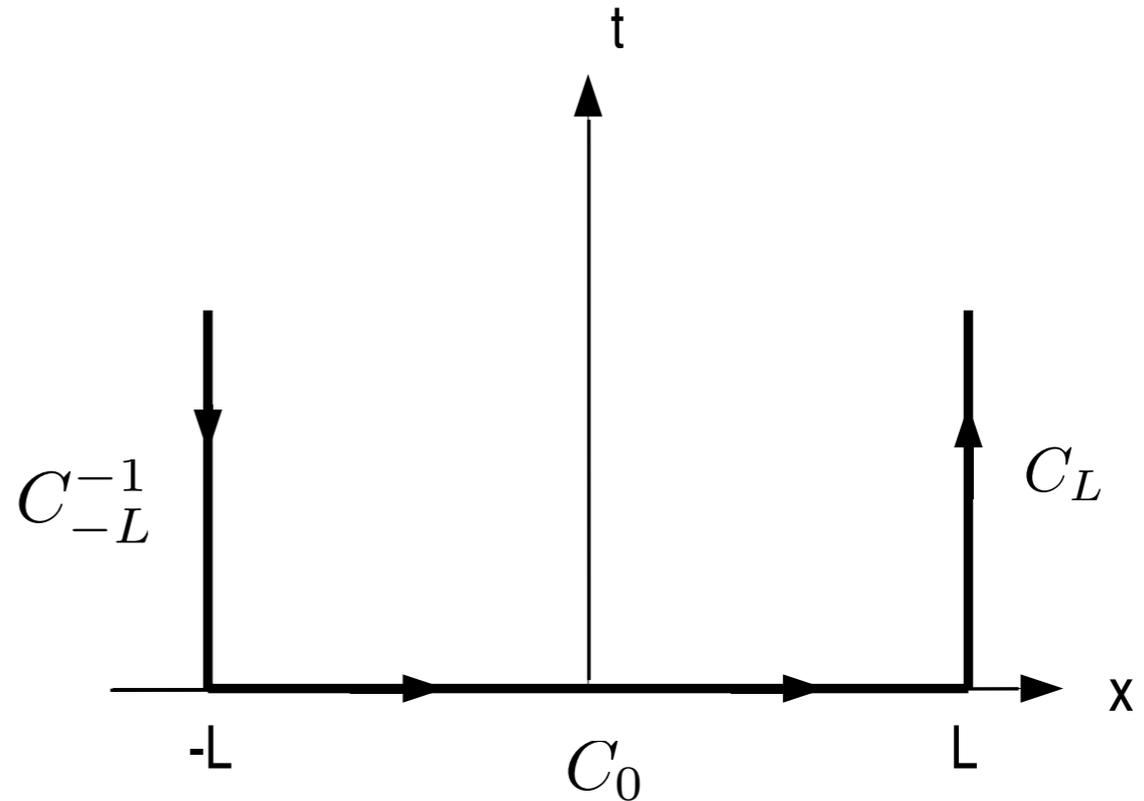

Path independency

$F_{\mu\nu} = 0$ means that $W = P e^{-\int_{\gamma} d\sigma A_{\mu} \frac{d x^{\mu}}{d \sigma}}$ is path independent

Boundary Condition

$$A_t(-L, t) = A_t(L, t)$$

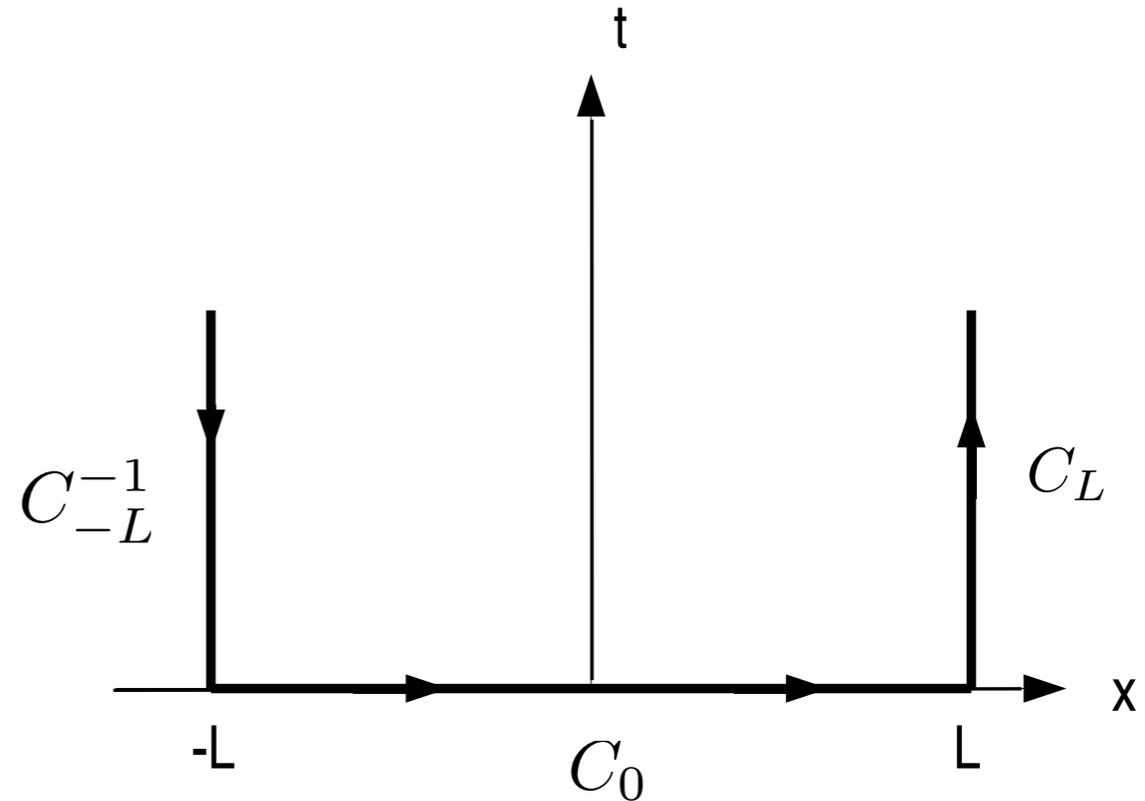

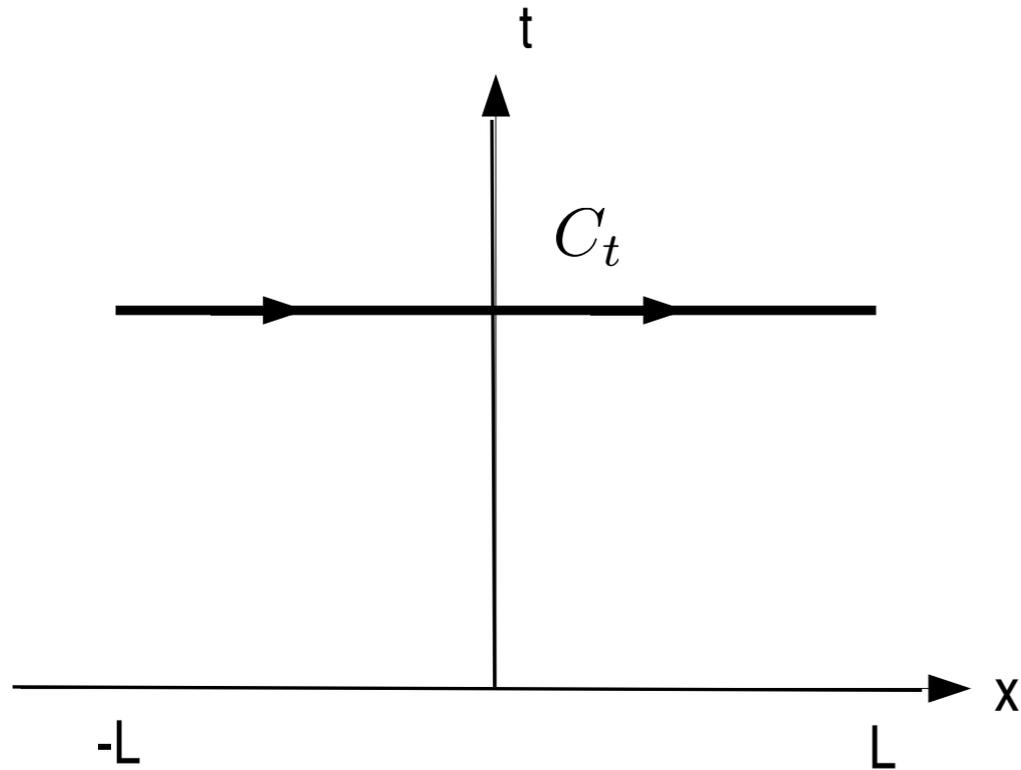

iso-spectral evolution

$$W(C_t) = U W(C_0) U^{-1}$$

Path independency

$F_{\mu\nu} = 0$ means that $W = P e^{-\int_{\gamma} d\sigma A_{\mu} \frac{d x^{\mu}}{d \sigma}}$ is path independent

Boundary Condition

$$A_t(-L, t) = A_t(L, t)$$

iso-spectral evolution

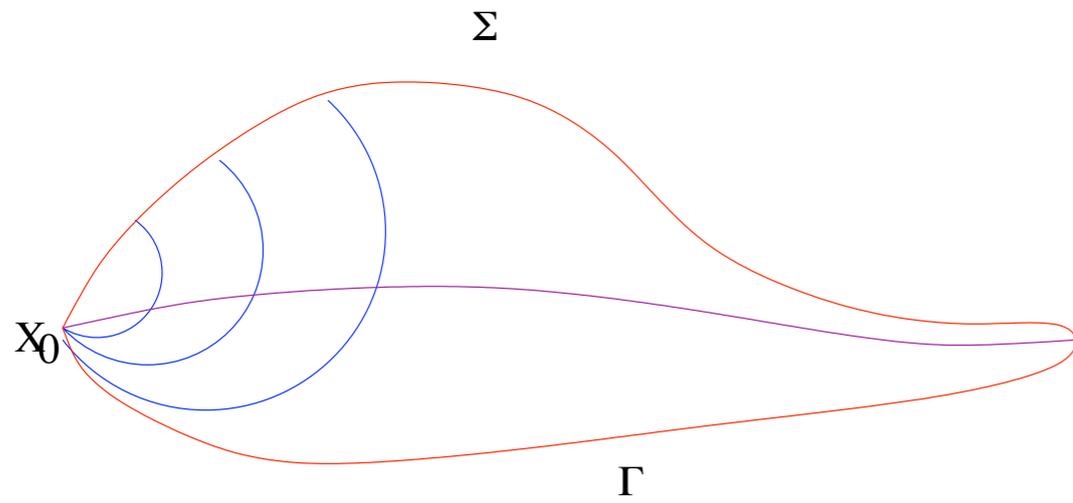

$$W(C_t) = U W(C_0) U^{-1}$$

Eigenvalues of W are conserved in time

power series in λ : infinite number of conserved quantities

3) Independent of parameterization

$$P_3 e^{\int_{\Omega_\infty^{(t)}} d\zeta d\tau V \mathcal{J} V^{-1}} \text{ is path independent}$$

4) Gives non-trivial dynamical magnetic charges to monopoles

5) Relevant for the global aspects of Yang-Mills theory

Example: (multi) Monopoles

Example: (multi) Monopoles

At spatial infinity the magnetic field has the form:

$$F_{ij} = \frac{1}{e} \varepsilon_{ijk} \frac{\hat{r}_k}{r^2} G(\theta, \varphi)$$

Example: (multi) Monopoles

At spatial infinity the magnetic field has the form:

$$F_{ij} = \frac{1}{e} \varepsilon_{ijk} \frac{\hat{r}_k}{r^2} G(\theta, \varphi)$$

But $\frac{d}{d\sigma} (W^{-1} G W) = W^{-1} D_i G W \frac{dx^i}{d\sigma}$

Example: (multi) Monopoles

At spatial infinity the magnetic field has the form:

$$F_{ij} = \frac{1}{e} \varepsilon_{ijk} \frac{\hat{r}_k}{r^2} G(\theta, \varphi)$$

But $\frac{d}{d\sigma} (W^{-1} G W) = W^{-1} D_i G W \frac{dx^i}{d\sigma} \xrightarrow{D_i G = 0} W^{-1} G W = G_R$

Example: (multi) Monopoles

At spatial infinity the magnetic field has the form:

$$F_{ij} = \frac{1}{e} \varepsilon_{ijk} \frac{\hat{r}_k}{r^2} G(\theta, \varphi)$$

$$\text{But } \frac{d}{d\sigma} (W^{-1} G W) = W^{-1} D_i G W \frac{dx^i}{d\sigma} \xrightarrow{D_i G = 0} W^{-1} G W = G_R$$

In such a case the charge operator becomes:

$$Q_S = e^{i e \alpha} \int_{S_\infty^2} d\sigma d\tau W^{-1} F_{ij} W \frac{dx^i}{d\sigma} \frac{dx^j}{d\tau} = e^{i 4 \pi \alpha} G_R$$

Example: (multi) Monopoles

At spatial infinity the magnetic field has the form:

$$F_{ij} = \frac{1}{e} \varepsilon_{ijk} \frac{\hat{r}_k}{r^2} G(\theta, \varphi)$$

But $\frac{d}{d\sigma} (W^{-1} G W) = W^{-1} D_i G W \frac{dx^i}{d\sigma} \xrightarrow{D_i G = 0} W^{-1} G W = G_R$

In such a case the charge operator becomes:

$$Q_S = e^{i e \alpha} \int_{S_\infty^2} d\sigma d\tau W^{-1} F_{ij} W \frac{dx^i}{d\sigma} \frac{dx^j}{d\tau} = e^{i 4 \pi \alpha} G_R$$

Eigenvalues of G_R are the charges

Example: (multi) Monopoles

At spatial infinity the magnetic field has the form:

$$F_{ij} = \frac{1}{e} \varepsilon_{ijk} \frac{\hat{r}_k}{r^2} G(\theta, \varphi)$$

$$\text{But } \frac{d}{d\sigma} (W^{-1} G W) = W^{-1} D_i G W \frac{dx^i}{d\sigma} \xrightarrow{D_i G = 0} W^{-1} G W = G_R$$

In such a case the charge operator becomes:

$$Q_S = e^{i e \alpha} \int_{S_\infty^2} d\sigma d\tau W^{-1} F_{ij} W \frac{dx^i}{d\sigma} \frac{dx^j}{d\tau} = e^{i 4 \pi \alpha} G_R$$

Eigenvalues of G_R are the charges

For BPS multi-monopole solutions

$$G_R = \frac{1}{2} \sum_{a=1}^{\text{rank } G} n_a \frac{2 \vec{\alpha}_a}{\alpha_a^2} \cdot \vec{h}$$

Example: (multi) Monopoles

At spatial infinity the magnetic field has the form:

$$F_{ij} = \frac{1}{e} \varepsilon_{ijk} \frac{\hat{r}_k}{r^2} G(\theta, \varphi)$$

But $\frac{d}{d\sigma} (W^{-1} G W) = W^{-1} D_i G W \frac{dx^i}{d\sigma} \xrightarrow{D_i G = 0} W^{-1} G W = G_R$

In such a case the charge operator becomes:

$$Q_S = e^{ie\alpha} \int_{S^2_\infty} d\sigma d\tau W^{-1} F_{ij} W \frac{dx^i}{d\sigma} \frac{dx^j}{d\tau} = e^{i4\pi\alpha} G_R$$

Eigenvalues of G_R are the charges

For BPS multi-monopole solutions $G_R = \frac{1}{2} \sum_{a=1}^{\text{rank } G} n_a \frac{2\vec{\alpha}_a}{\alpha_a^2} \cdot \vec{h}$

In a d -dimensional representation the eigenvalues of G_R are:

$$\frac{1}{2} \sum_{a=1}^{\text{rank } G} n_a \left(m_a^{(1)}, m_a^{(2)}, \dots, m_a^{(d)} \right)$$

The case of $SU(3)$

The case of $SU(3)$

For the triplet representation the charges are

$$\frac{1}{2e} (n_1, n_2 - n_1, -n_2)$$

The case of $SU(3)$

For the triplet representation the charges are

$$\frac{1}{2e} (n_1, n_2 - n_1, -n_2)$$

and for the adjoint representation

$$\frac{1}{2e} (n_1 + n_2, 2n_1 - n_2, -n_1 + 2n_2, 0, 0, -2n_1 + n_2, n_1 - 2n_2, -n_1 - n_2)$$

The case of $SU(3)$

For the triplet representation the charges are

$$\frac{1}{2e} (n_1, n_2 - n_1, -n_2)$$

and for the adjoint representation

$$\frac{1}{2e} (n_1 + n_2, 2n_1 - n_2, -n_1 + 2n_2, 0, 0, -2n_1 + n_2, n_1 - 2n_2, -n_1 - n_2)$$

So, charges are the magnetic weights n_a

The case of $SU(3)$

For the triplet representation the charges are

$$\frac{1}{2e} (n_1, n_2 - n_1, -n_2)$$

and for the adjoint representation

$$\frac{1}{2e} (n_1 + n_2, 2n_1 - n_2, -n_1 + 2n_2, 0, 0, -2n_1 + n_2, n_1 - 2n_2, -n_1 - n_2)$$

So, charges are the magnetic weights n_a

The topological charges are

The case of $SU(3)$

For the triplet representation the charges are

$$\frac{1}{2e} (n_1, n_2 - n_1, -n_2)$$

and for the adjoint representation

$$\frac{1}{2e} (n_1 + n_2, 2n_1 - n_2, -n_1 + 2n_2, 0, 0, -2n_1 + n_2, n_1 - 2n_2, -n_1 - n_2)$$

So, charges are the magnetic weights n_a

The topological charges are

$$SU(3) \rightarrow U(1) \otimes U(1) \longrightarrow Q_B^{\text{Top. (max.)}} = v \frac{\pi}{e} (n_1 + n_2)$$

The case of $SU(3)$

For the triplet representation the charges are

$$\frac{1}{2e} (n_1, n_2 - n_1, -n_2)$$

and for the adjoint representation

$$\frac{1}{2e} (n_1 + n_2, 2n_1 - n_2, -n_1 + 2n_2, 0, 0, -2n_1 + n_2, n_1 - 2n_2, -n_1 - n_2)$$

So, charges are the magnetic weights n_a

The topological charges are

$$SU(3) \rightarrow U(1) \otimes U(1) \longrightarrow Q_B^{\text{Top. (max.)}} = v \frac{\pi}{e} (n_1 + n_2)$$

$$SU(3) \rightarrow SU(2) \otimes U(1) \longrightarrow Q_B^{\text{Top. (min.)}} = v \frac{\pi}{e} n_2$$

To think further...

- Yang-Mills is equivalent to the flatness condition on loop space $\Omega^{(2)} (S^2 \rightarrow M)$

$$\delta \mathcal{A} + \mathcal{A} \wedge \mathcal{A} = 0$$

$$\mathcal{A} \equiv \int_0^{2\pi} d\tau \int_0^{2\pi} d\sigma V \left\{ ie\beta \tilde{J}_{\mu\nu\lambda}^W \frac{dx^\mu}{d\sigma} \frac{dx^\nu}{d\tau} \delta x^\lambda \right.$$

$$\left. + e^2 \int_0^\sigma d\sigma' \left[\left((\alpha - 1) F_{\kappa\rho}^W + \beta \tilde{F}_{\kappa\rho}^W \right) (\sigma'), \left(\alpha F_{\mu\nu}^W + \beta \tilde{F}_{\mu\nu}^W \right) (\sigma) \right] \right.$$

$$\left. \times \frac{dx^\kappa}{d\sigma'} \frac{dx^\mu}{d\sigma} \left(\frac{dx^\rho(\sigma')}{d\tau} \delta x^\nu(\sigma) - \delta x^\rho(\sigma') \frac{dx^\nu(\sigma)}{d\tau} \right) \right\} V^{-1}$$

(it solves parameterization problem!)
