Cosmic Microwave Backgrou	ind		
Foregrounds			

Two types:

- Diffuse galactic radiation: free-free, synchrotron, thermal dust, spinning dust...
- Point sources: radio galaxies, dusty galaxies.
- Planck observed in 9 different bands from 30 GHz to 857 GHz.
- They are combined to extract the CMB temperature maps.
- Four algorithms to clean the maps:

Introduction 0000000	Methodology 000000	Results 000000	Conclusions 0000
Needlets and multiple testing			
Needlets I			

• Functions defined over the sphere, used to filter the map.

$$\psi_j(x,\xi) := \sum_{\ell} \frac{b(\frac{\ell}{B^j})}{\sum_{m=-\ell}^{\ell} Y_{\ell m}(x) \overline{Y}_{\ell m}(\xi)}$$

Introduction	Methodology	Results	Conclusions
000000	000000	000000	0000
Needlets and multiple testing			
Needlets I			

• Functions defined over the sphere, used to filter the map.

$$\psi_j(x,\xi) := \sum_{\ell} b(rac{\ell}{B^j}) \sum_{m=-\ell}^{\ell} Y_{\ell m}(x) \overline{Y}_{\ell m}(\xi)$$

Six advantages

- 1. Do not rely on tangent plane approximation.
- 2. Calculated from spherical harmonics.
- 3. Simple reconstruction formula.
- 4. Different scales are uncorrelated.

Introduction	Methodology	Results	Conclusions
0000000	000000	000000	0000
Needlets and multiple testing			
Needlets II			

Six advantages

- 5. Very concentrated in pixel space.
- 6. Localised in multipole space.

Introduction 0000000	Methodology 000000	Results 000000	Conclusions
Needlets and multiple testing			
Multiple testing			

- Let us imagine two scenarios:
- We have a map with a maximum with a high intensity x.
- Assuming a gaussian map, we expect to find 1 maximum at intensity x in the entire map.
- The maximum x is compatible with gaussianity, it may be a random fluctuation.

Introduction	Methodology	Results	Conclusions
0000000	000000	000000	0000

0000000	000000	000000	0000
Needlets and multiple testing			

Benjamini-Hochberg approach

- 1. We obtain the values of the maxima.
- 2. For each value x, we count the number of maxima in the map at intensity x or higher: n(x).
- 3. For each value x, we calculate the expected number of maxima at intensity x or higher, assuming gaussianity: N(x).
- 4. If there is x_0 such that $N(x_0) < n(x_0)$, we report the first $n(x_0)$ maxima.

STEM algorithm			
False Discov	erv Rate		

• The False Discovery Rate for the STEM algorithm is defined as:

$$FDR := \frac{\#(False \text{ detections})}{\#(Total \text{ detections})}$$

- It depends on the parameters of the algorithm B, j, and α .
- It can be proven that, for high enough j,

$$FDR \lesssim \alpha$$

Introduction 00000000	Methodology ○○○●○○	Results 000000	Conclusions
STEM algorithm			
Code			

• Development of a small package in Python 3:

MTNeedlet: https://javicarron.github.io/mtneedlet/

- It contains all functions needed for needlet filtering and applying the STEM algorithm.
- Fully documented and flexible in order to apply it to other problems.

15 / 26

Introduction 00000000	Methodology ○○○○○●	Results 000000	Conclusions
Implementation			
Real data			

- The algorithm is applied to Planck CMB temperature maps, version 2 (2015) and 3 (2018).
- For version 3, inpainted and not inpainted maps are used.
- Number of detections is obtained for the whole map, outside inpainting mask (~ 98% of the sky), and outside common confidence mask (~ 78% of the sky).
- Detections are compared to the Planck Source Catalogues.

 - Simulations
 - Planck Data

4. Conclusions and future work

Introduction	Methodology	Results	Conclusions
0000000	000000	000000	0000

Conclusions

- We have tested the STEM algorithm through **simulations** under different conditions in order to find the optimal choice of parameters and keep the *FDR* within limits.
- The last release of **Planck data** is mostly compatible with non-contaminated maps, although a few point sources are reported.
- A **software** has been developed to work with *needlets* and *multiple testing*. It is now publicly available.

Introduction	Methodology	Results	Conclusions
00000000	000000	000000	
Future work			

- Only temperature maps have been studied, the algorithm can be also applied to **polarization** maps: *E* and *B* modes.
- Needlets are very **flexible**, these techniques could be applied with other goals, such as extracting a lensing map.
